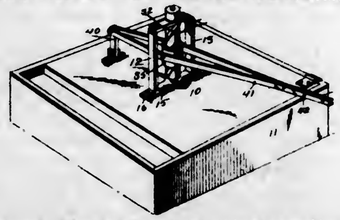
5. In a filter-press, a container provided with a keystone-shaped rib along a portion of the inner surface of said container.

6. In a filter-press, a container provided with a series of keystone-shaped ribs, along a portion of the inner surface of said container.

7. In a filter-press, a container provided with a series of keystone-shaped ribs along a portion of the inner surface, and a single keystone-shaped rib along the remainder of the inner surface.

8. In a filter-press, a container provided with a certain number of keystone-shaped ribs along a portion of the inner surface, and a varying number of similar ribs along the remainder of the inner surface.

813,015. **GEARING FOR WASHING-MACHINES.** HUGH H. MURSON, Truro, Iowa. Filed Nov. 26, 1904. Serial No. 234,354.



Claim.—1. A frame having openings in its upper and lower portions, a shaft extending through the openings in the frame, a ball-bearing mounted near the upper end of the shaft and at the upper portion of the frame, a worm-gear detachably secured to the shaft and between the upper and lower portions of the frame, a collar surrounding the worm-gear, rollers on the inside of the collar designed to enter the worm-gear, and means for moving the collar vertically.

2. A frame having openings in its upper and lower portions, a shaft extending through the openings in the frame, a ball-bearing mounted near the upper end of the shaft and at the upper portion of the frame, a worm-gear detachably secured to the shaft and between the upper and lower portions of the frame, a collar surrounding the worm-gear, rollers on the inside of the collar designed to enter the worm-gear, a pivotally-mounted link, and a lever pivoted to the link and to the collar, for the purposes stated.

3. In a gearing for washing-machines, a shaft, a worm-gear detachably secured to the shaft, a collar capable of vertical movement along the worm-gear, rollers secured to the collar designed to enter the worm-gear, means for moving the collar vertically to oscillate the shaft, a ball-bearing for supporting the upper end of the shaft, and a frame for supporting the ball-bearing.

4. A substantially rectangular frame provided with a ring at its upper portion, a support therefor, a shaft extending vertically of the frame, a ball-bearing mounted in the ring in the upper portion of the frame for rotatably supporting the shaft, a worm-gear secured to the shaft inside of the frame, a collar encircling the worm-gear and capable of vertical movement, rollers on the inside of the collar entering the worm-gear, and a lever pivoted to the collar and to the top of said

support with which the collar may be moved vertically for rotating the shaft.

9. A substantially rectangular frame provided with a ring at its upper portion, a support therefor, a shaft extending vertically of the frame, a ball-bearing mounted in the ring in the upper portion of the frame for rotatably supporting the shaft, a worm-gear detachably secured to the shaft inside of the frame, a collar encircling the worm-gear and capable of vertical movement, rollers on the inside of the collar entering the worm-gear, a lever pivoted to the collar and to the top of said support, with which the collar may be moved vertically for rotating the shaft, and means for securing the frame to the top of a washing-machine.

813,016. DRAIN-TILE PROTECTOR. WILLIAM J. MCHUGH, Dana, Iowa. Filed Aug. 12, 1905. Serial No. 273,965.

Claim.—1. A protector for tile comprising a body portion having an opening through it, a network in the opening, means for securing the protector in position relative to the end of the tile.

2. In a protector for tile, a body portion having an opening extending through it, a network in the opening, lugs extending outwardly from the body portion, and means connected with the lugs for maintaining the protector in position relative to the end of a tile.

3. In a protector for tile, an inner portion, a collar secured to the inner portion, designed to encircle the end of a tile, an outer portion, means for securing the outer portion to the inner portion, a series of rods forming a network secured between the inner and outer portions and in an opening which extends through the inner and outer portions.

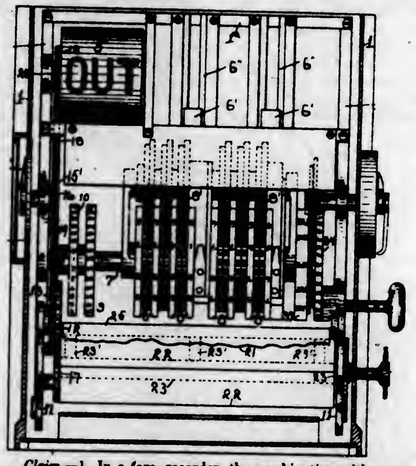
4. In a protector for tile, an inner portion, a collar secured to the inner portion, designed to encircle the end of a tile, an outer portion, means for securing the outer portion to the inner portion, a series of rods forming a network secured between the inner and outer portions and in an opening which extends through the inner and outer portions, and means for securing the protector in position relative to the end of a tile.

5. In a protector for tile, an inner portion having an opening extended through it, a collar integral with the inner portion, designed to encircle the end of the tile, said inner portion having a series of grooves extending vertically of it, a rod in each of said grooves, a hooked portion in the rod designed to maintain the rod against downward movement, an outer portion having an opening extending through it in line with the opening in the inner portion and having a series of horizontal channels extending across its inner surface, a series of rods in said channels designed to engage the rods in the inner portion, and means for securing the inner and outer portions together.

6. In a protector for tile, an inner portion having an opening extending through it, a collar integral with the inner portion, designed to encircle the end of the tile, said inner portion having a series of grooves extending vertically of it, a rod in each of said grooves, a hooked portion in the rod designed to maintain the rod against downward movement, an outer portion having an opening extending through it in line with the opening in the inner portion and having a series of horizontal channels extending across its inner surface, a series of rods in said channels designed to engage the rods in the inner portion, means for securing the inner and outer portions together, and means for securing the protector in position relative to the end of the tile.

7. In a protector for tile, an inner portion having an opening extended through it, a collar integral with the inner portion, designed to encircle the end of the tile, said inner portion having a series of grooves extending vertically of it, a rod in each of said grooves, a hooked portion in the rod designed to maintain the rod against downward movement, an outer portion having an opening extending through it in line with the opening in the inner portion and having a series of horizontal channels extending across its inner surface, a series of rods in said channels designed to engage the rods in the inner portion, means for securing the inner and outer portions together, lugs having openings in them secured to the outer surface of the outer portion, and rods entering the openings in the lugs and designed to be driven into the ground for securing the protector in position relative to the end of the tile.

813,017. FARE-RECORDER. JOHN F. OHMER, Dayton, Ohio, assignor to Ohmer Fare Register Co., Rochester, N. Y. Filed Aug. 26, 1905. Serial No. 275,719.



Claim.—1. In a fare-recorder, the combination with a set of printing-counters denoting the number of fares recorded, of a type-wheel denoting the direction, impression devices for taking statements or records from said printing-counters and said type-wheel, and means connecting the direction type-wheel and the impression devices by which said drection type-wheel is moved each time an impression is taken.

2. In a fare-recorder, the combination with a set of printing-counters denoting the number of fares recorded, of a type-wheel denoting the direction, a tablet or dial for indicating the direction, impression devices for taking statements from said printing-counters and type-wheel, and means for simultaneously moving the direction-indicator, the type-wheel denoting the direction, and the said impression devices.

3. In a fare-recorder, the combination with printing-counters assembled in groups and each group denoting a specific class of fares, an indicator denoting the directions, type letters or characters corresponding to the direction-indicators and moving simultaneously therewith, impression devices, the movement of which, actuates the direction-indicator and its corresponding type letters or characters.

4. In a fare-recorder, the combination with groups of printing-counters denoting the specific classes of fares, a direction-printer located in a plane with said printing-counters, a direction-indicator, impression devices, and means interposed between said impression devices, said direction-printer, and said direction-indicator for simultaneously actuating said direction-printer and direction-indicator upon each operation of the impression devices.

5. In a fare-recorder, the combination with a plurality of groups of printing-counters denoting specific classes of fares, a similar number of specific-fare indicators, and means for simultaneously actuating the fare-printing counters and the fare-indicators, of a direction-indicator, a direction-printer, impression devices, and means interposed between said impression devices and the direction-indicator and direction-printer for simultaneously moving said direction-indicator and said direction-printer from each movement of the impression devices.

6. In a fare-recorder, the combination with printing-counters denoting the fares registered, of a direction-printer mounted in line with said fare-printing counters, a direction-indicator, a platen or impression-bar, and connections between said impression-bar or platen, and the direction-printer and the direction-indicator, whereby upon each operation of taking a statement or record from the printing-counters and the direction-printer, the direction-printer and the direction-indicator are simultaneously set.

7. In a fare-recorder, the combination with groups of printing-counters, each group denoting a specific class of fares, an indicator to exhibit separately the fares of each class, month and date printers, a direction-printer, a direction-indicator, and connections between the direction-indicator, the direction-printer and the actuating member of the printing devices, whereby, in each printing operation, the direction-indicator and the direction-printer are simultaneously set.

8. In a fare-recorder, a plurality of groups of printing-counters denoting the different classes of fares, a stationary dial indicating the directions, a pointer on said dial, a rotating member also indicating the directions, a direction-printer, and means interposed between said pointer, said direction-printer, and said rotating direction-indicator for simultaneously actuating said rotating direction-indicator, and the direction-printer in setting the pointer to indicate the directions.

9. In a fare-recorder, the combination with printing-counters denoting different classes of fares, and printing or impression devices, of a direction-indicator, a direction-printer, and means connecting said direction-indicator, said direction-printer and the actuating member of the printing or impression devices, whereby upon each operation of taking a statement or record, the direction-indicator and the direction-printer are simultaneously operated.

10. In a fare-recorder, the combination with a plurality of fare-indicators, of a direction-indicator, a direction-printer, impression devices, and means interposed between said impression devices and the direction-indicator and said direction-printer to move said direction-indicator and said direction-printer with each movement of the impression devices.

11. A direction-printer, an indicator, means for taking a print or impression from said direction-printer, said means controlling the positions of the direction-printer and the indicator.

12. A fare-printing counter, a direction-printer, and means for taking a print or impression from said fare-printing counter and direction-printer, said means controlling the position of the direction-printer.

13. A fare-printing counter, a direction-printer, means for taking prints or impressions from said fare-printing counter and said direction-printer, and means connecting said direction-printer with said means for taking said prints or impressions, whereby the direction-printer is controlled by said means for taking the prints or impressions.

14. A fare-printing counter, a direction-printer, an indicator, and means for taking an impression from said printing-counter and controlling the shifting operation of the direction-printer and the indicator.

15. A fare-printing counter, a direction-printer, a direction-indicator, and means for taking impressions from said fare-printing counter and said direction-printer, said means controlling the shifting operation of the direction-printer and the direction-indicator.

16. A direction-printer, a direction-indicator and an auxiliary indicator connected to said direction-printer and direction-indicator and adapted to shift said direction-printer and said direction-indicator in the movements by which said auxiliary indicator is made to exhibit the indications thereon.

17. A direction-printer, a direction-indicator connected to said direction-printer, and an auxiliary stationary indicator having a pointer, said pointer being connected to the direction-printer and the direction-indicator and adapted to shift the direction-printer and the direction-indicator to operative positions upon each movement of said pointer to indicate upon the auxiliary dial.

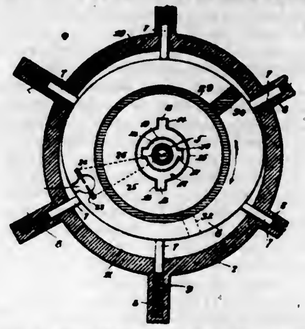
18. A direction-printer, a direction-indicator and an auxiliary direction-indicator having a pointer connected to the direction-printer and the first-named direction-indicator, said pointer being adapted to shift the direction-printer and the first-named direction-indicator upon each movement of said pointer to positions to indicate on the auxiliary direction-indicator.

19. A direction-printer, a direction-indicator, an auxiliary direction-indicator connected with said direction-printer and the first-named direction-indicator, and means for taking an impression from said direction-printer and for controlling the shifting operation of said direction-printer and said direction-indicators.

20. A fare-printing counter, a direction-printer, a direction-indicator, an auxiliary direction-indicator, and means for taking an impression from said printing-counter and said direction-printer and for controlling the shifting operations of said direction-printer and said direction-indicators.

21. A direction-printer, a direction-indicator and an auxiliary direction-indicator, the latter being fixed as to rotation, a pointer movable to the indications on said auxiliary indicator, said pointer being geared to the direction-printer and the first-named direction-indicator and adapted to move the same concurrently to operative positions in the movements which indicate upon the auxiliary indicator.

813,018. ROTARY ENGINE AND MOTOR. MORRIS S. OKUN, New York, N. Y. Filed Apr. 25, 1902. Serial No. 104,686.



Claim.—1. A rotary engine, motor or the like, comprising the combination of a casing and a piston or movable element therein, which snugly fits the sides of the casing, a shaft connected with said movable element or piston, and means for permitting a relative lateral movement between the shaft and the movable element or piston, substantially as and for the purpose set forth.

2. A rotary engine, motor or the like, compriaing the combination of a casing and a piston or movable element therein, which snugly fits the sides of the casing, a shaft connected with said movable element or piston, and means for permitting a relative lateral angular movement between the shaft and the movable element or piston, substantially as and for the purpose set forth.

3. A rotary engine, motor or the like, comprising the combination of a casing and a movable element or piston, which snugly fits the sides of the casing, a shaft connected with said movable element or piston by the means of a laterally-yielding joint consisting of a projection or projections carried by one part and a bearing or bearings or cavities for the projections carried by the other part, substantially as and for the purpose set forth.

4. A rotary explosive-engine comprising the combination of two elements having relative rotary movement and having different forms so as to provide a suitable working space between said elements, and the said elements fitting snugly to each other at certain points to prevent the leakage of fluid, a set of partitions adapted to be projected and retracted during the relative rotary movement and dividing the said working space into separate sections, which sections constitute, respectively, chambers wherein the explosive mixture is introduced and in succession compressed, ignited and expanded and finally exhausted therefrom, said cycle of actions being completed at every revolution in each section, substantially as and for the purpose set forth.

5. A rotary explosive-engine comprising the combination of two elements, of which one fits snugly to the sides of the other and having a relative rotary movement, one of said elements being of an oval form for providing between the two a compression, explosion and expansion chamber, and means operated and controlled by each complete revolution of the movable element for successively drawing into the said chamber the explosive mixture, compressing the same, igniting, exploding and exhausting it, substantially as and for the purpose set forth.

6. A rotary explosive-engine comprising the combination of two elements having relative rotary movement, a suitable working space being provided between said elements and the said elements fitting snugly to each other at certain points to prevent the leakage of fluid, a set of partitions adapted to be projected and retracted during the relative rotary movement and dividing the said working space into separate sections, which sections constitute, respectively, chambers wherein the explosive mixture is introduced and in succession compressed, ignited, and expanded and finally exhausted therefrom, such successive actions taking place in each of the said sections during one revolution, each section of such space formed between two adjacent partitions being twice reduced and enlarged in its volume during each revolution of the said movable element, said cycle of ac-

tions being completed at every revolution in each section substan-

and a universal joint between said shaft and movable element, sub-

813,020. GUNPOWDER AND PROCESS OF MAKING SAME.

tions being completed at every revolution in each section substantially as and for the purpose set forth.

7. A rotary explosive-engine comprising the combination of a casing and a movable element or piston which fits snugly to the sides of the casing, one of said elements being of an oval form for providing between the two a space divided into compartments, each of which is twice alternately reduced and increased in its capacity or area during one revolution of the piston, and means operated and controlled by each complete revolution of the movable element for successively drawing into the said chamber the explosive mixture, compressing the same, igniting, exploding and exhausting it, substantially as and for the purpose set forth.

8. The combination of a casing and a body or piston mounted therein and provided with a shaft, the said body or piston and casing having a relative rotary movement and each fitting against the sides of the other, a yoke fixed upon the shaft and provided with opposite projections forming bearings for a main yoke, a main yoke mounted upon said fixed yoke and provided with opposite projections constituting bearings for the piston, said piston being mounted upon said main yoke, whereby the piston and its shaft have a lateral yielding movement relative to each other, substantially as and for the purpose set forth.

9. The combination of a casing, a piston mounted within said casing and having a relative rotary movement, the periphery of the piston and the interior of the casing being so related as to provide two crescent-shaped spaces at diametrically opposite points and such spaces serving as the compression and expansion chambers respectively a series of movable vanes normally closing across each of said spaces, an inlet-pipe for supplying the explosive mixture to the compression-chamber and an exhaust-pipe connected with the expansion-chamber, and an igniting device for exploding the mixture when the same is compressed, substantially as and for the purpose set forth.

10. The combination of a casing, a piston 6 mounted within said casing and having a relative rotary movement, the periphery of the piston and the interior of the casing being so related as to provide two crescent-shaped spaces 10 and 11, respectively, at diametrically opposite points and such spaces serving as the compression and expansion chambers respectively, a series of movable vanes 7 normally closing across each of said spaces, an inlet-pipe for supplying the explosive mixture to the compression-chamber and an exhaust-pipe connected with the expansion-chamber, and an igniting device for exploding the mixture when the same is compressed, substantially as and for the purpose set forth.

11. The combination of a casing and a body or piston mounted therein and provided with a shaft, the said body or piston and casing having a relative rotary movement and each fitting snugly against the sides of the other, and the said body or piston and its shaft having a universal joint between them to permit relative lateral yielding and at the same time cause them to rotate in response to each other, substantially as and for the purpose set forth.

12. A rotary engine, pump or the like, comprising the combination of a casing and a movable element fitting snugly therein to the sides of the casing, a shaft connected with said movable element and actuated thereby, said shaft and movable element having a relative oscillatory or pivotal motion, substantially as and for the purpose set forth.

13. A rotary engine, pump or the like, comprising the combination of a stationary and a movable element fitting snugly to each other, a space between the two said elements and into which the gas or fluid is introduced, the two said elements fitting snugly against each other in order to prevent the escape of the said gas or fluid from the said space, a shaft on which the movable element is mounted, and said shaft and movable element having a relative lateral motion, substantially as and for the purpose set forth.

14. A rotary engine, pump or the like, comprising the combination of a stationary and a movable element fitting snugly to each other, a space between the two said elements and into which the gas or fluid is introduced, the two said elements fitting snugly against each other in order to prevent the escape of the said gas or fluid from the said space, a shaft on which the movable element is mounted, and said shaft and movable element having a relative oscillatory or pivotal motion, substantially as and for the purpose set forth.

15. A rotary engine, pump or the like, comprising the combination of a stationary and a movable element fitting snugly to each other, a space between the two said elements and into which the gas or fluid is introduced, the two said elements fitting snugly against each other in order to prevent the escape of the said gas or fluid from the said space, a shaft on which said movable element is mounted and a universal joint between said shaft and movable element, substantially as and for the purpose set forth.

16. A rotary engine, pump or the like, comprising the combination of a stationary and a movable element fitting snugly to each other, a space between the two said elements and into which the gas or fluid is introduced, the two said elements fitting snugly against each other in order to prevent the escape of the said gas or fluid from the said space, a shaft on which said movable element is mounted, the joint between said shaft and movable element comprising one or more projections carried by one part and fitting in bearings or cavities carried by the other part, substantially as and for the purpose set forth.

17. A rotary explosive or like engine comprising the combination of a suitable casing and a rotary piston mounted therein and fitting snugly to the sides of the casing, a suitable space between the piston and casing varying in its distance between the two so as to make such space of a gradually-increasing size from one point to another, the said space being contracted at two places and enlarged at two places intermediate between the contracted ones, a set of partitions dividing said space into separate sections and said partitions being projected and retracted as the piston rotates, an inlet-pipe for supplying the explosive mixture to the interior of the casing and an exhaust-pipe leading from said casing, and an igniting device, the said explosive mixture being introduced into each of said sections once during each complete revolution of the piston and being compressed, ignited and expanded in and exhausted from each of said sections once during each revolution, substantially as and for the purpose set forth.

18. A rotary explosive-engine comprising the combination of two elements having relative rotary movement, a suitable working space being provided between said elements and the said elements fitting snugly to each other at certain points to prevent the leakage of fluids, a set of partitions adapted to be projected and retracted during the relative rotary movement and dividing the said working space into separate sections, which sections constitute, respectively, chambers wherein the explosive mixture is introduced and in succession compressed, ignited and expanded and finally exhausted therefrom, said cycle of actions being completed at every revolution in each section, and means for effecting said ignition comprising an igniting-chamber in direct and constant communication with said working space between the two said elements, substantially as and for the purpose set forth.

813,019. CROWN-PROTECTOR FOR HATS. MOSES OLDORT, New York, N. Y. Filed Jan. 31, 1905. Serial No. 243,551.

Claim.—1. A crown-protector for hats, comprising an open-work frame composed of spring material and shaped to fit the interior of the crown, the lower portion or base of the said protector being so shaped as to fit between the sweat-band and the crown of the hat, and removably secure the protector in position within the hat, substantially as described.

2. The herein-described form-retainer and crown-protector for hats, comprising an open-work frame composed of spring material and so shaped as to fit the interior of the crown, said frame being adapted to be inserted into the crown of the hat and secured therein, and the size of the bottom portion of the frame being adjustable, substantially as shown and described.

3. A crown-protector for hats, comprising an open-work frame of spring material shaped to fit the interior of the crown, the base being composed of a flat strip adapted to be placed between the sweat-band and the hat, and removably secure the protector in place, substantially as described.

4. The combination with the crown of the hat of a form retainer and protector, comprising an open-work frame composed of spring material and so shaped as to fit the interior of the crown, said frame being inserted into the crown and secured therein, and the size of the bottom portion of the frame being adjustable, substantially as shown and described.

813,020. GUNPOWDER AND PROCESS OF MAKING SAME. FRANCIS I. DU PONT, Wilmington, Del. Filed Aug. 3, 1904. Serial No. 219,358.

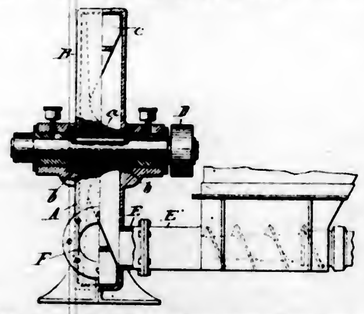
Claim.—1. The hereinbefore-described process of making gunpowder, adapted to be molded into grains or other desired forms, which consists in forming a gunpowder, containing starch, mixing water therewith, then subjecting the admixture to the action of heat sufficient to swell the starch-granules, and then forming the powder into grains or other desired forms.

2. The hereinbefore-described process of making gunpowder, adapted to be molded into grains or other desired forms, which consists in forming a powder, containing starch, in the proportion of seven to eight per cent. of the total ingredients, then adding an amount of water from five to fifteen per cent. and mixing the same, then subjecting the mixture to the action of heat sufficient to swell the starch-granules, then pressing the material into grains or other desired forms.

3. A new gunpowder containing starch and water, the starch-granules being swelled by heat.

4. The hereinbefore-described process of making gunpowder, containing starch, which consists in subjecting said powder, with the starch in a moist condition, to the action of heat sufficient to swell the starch-granules.

813,021. METHOD OF CHARGING RETORTS, MUFFLES, FURNACES, AND THE LIKE. AUGUSTIN L. J. QUENEAU, South Bethlehem, Pa. Filed Jan. 16, 1905. Serial No. 241,272.



Claim.—1. The method of supplying retorts, muffles, furnaces, and the like, with finely-divided solid ingredients, which consists in projecting the same, by impact blows, in a continuous and homogeneous stream, into the retort, muffle, or furnace; substantially as described.

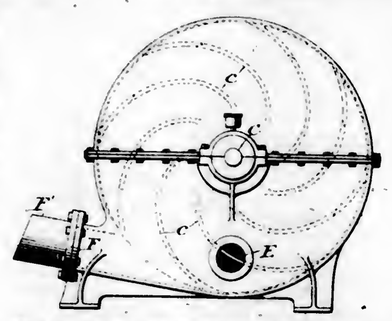
2. The method of supplying retorts, muffles, and the like, with a charge of associated ingredients, which consists in projecting the charge, by impact blows, in a continuous and homogeneous stream into the retort or muffle to be charged, said impact blows being of a character to further comminute and intermingle the ingredients; substantially as described.

3. The method of supplying retorts, muffles, furnaces, and the like, with finely-divided ingredients, which consists in projecting the same in a continuous and homogeneous stream into the retort, muffle, or furnace, avoiding subsequent scattering of the stream by practically excluding air from it during its formation, and consolidating said stream into a substantially cylindrical column after it has received its initial momentum and is under way; substantially as described.

4. The method of supplying retorts, muffles, furnaces and the like, with finely-divided solid ingredients, which consists in projecting the same, by impact blows, in a continuous and homogeneous stream, into the retort, muffle, or furnace, and practically excluding air from said stream; substantially as described.

813,022. CHARGING-MACHINE. AUGUSTIN L. J. QUENEAU, South Bethlehem, Pa. Filed Jan. 16, 1905. Serial No. 241,273.

Claim.—1. A charging-machine, comprising an inclosing casing, a rotary shaft, a series of impact-blades, an inlet for feeding the material to be charged into the path of movement of the outer ends of the blades, feeding mechanism arranged in the inlet and terminating in advance of its discharge-mouth, thereby serving as a seal against the admission of air with the charging material, and a tangential outlet; substantially as described.



2. A charging-machine, comprising an inclosing casing, a rotary shaft, a series of impact-blades, a tangential outlet, and an inlet adjacent to the outer ends of the blades, said inlet entering the side of the casing transversely to the plane of revolution of the blades and immediately in advance of the outlet; substantially as described.

3. A charging-machine, comprising an inclosing casing, a rotary shaft, a series of impact-blades, an inlet entering the side of the casing transversely to the path of movement of the blades, and a tangential outlet, said tangential outlet having a tubular continuation forming a directing-spout; substantially as described.

4. A charging-machine, comprising an inclosing casing, a rotary shaft, an impeller-disk provided on its face with a series of impact-blades, an inlet entering the side of the casing transversely to the path of movement of the blades, and a tangential outlet; substantially as described.

5. A charging-machine, comprising an inclosing casing, a rotary shaft, a series of impact-blades, an inlet for feeding the material to be charged into the path of movement of the outer ends of the blades, a tangential outlet, and a forced feed for the inlet, said forced feed terminating in advance of the discharge-mouth of the inlet, thereby leaving an intervening portion which serves as a seal against the admission of air with the charging material; substantially as described.

6. A charging-machine, comprising an inclosing casing, a rotary shaft, a series of impact-blades whose outer ends are curved in the form of involutes, an inlet for feeding the material to be charged into the path of movement of said outer ends, and a tangential outlet; substantially as described.

7. A charging-machine, comprising an inclosing casing, a rotary shaft, an impeller-disk provided on its face with a series of curved blades of substantially the width of the casing at their outer ends and decreasing in width inwardly, an inlet adjacent to the outer ends of the blades, and a tangential outlet; substantially as described.

8. A charging-machine, comprising an inclosing casing, a rotary shaft, an impeller-disk provided on its face with a series of curved blades of substantially the width of the casing at their outer ends and decreasing in width inwardly, an inlet adjacent to the outer ends of the blades, a forced feed for said inlet, and a tangential outlet; substantially as described.

9. A charging-machine, comprising an inclosing casing, a rotary shaft, an impeller-disk provided on its face with a series of curved blades of substantially the width of the casing at their outer ends and decreasing in width inwardly, an inlet adjacent to the outer ends of the blades, a forced feed for said inlet, and a tangential outlet, said tangential outlet having a continuation forming a direction-spout; substantially as described.

10. A charging-machine, comprising an inclosing casing, a rotary shaft, a series of impact-blades, an inlet for feeding the material through the side of the casing into the path of movement of the outer ends of the blades, and a feed conveyer separated from the discharge-mouth of the inlet by an intervening sealing-space; substantially as described.

813,028. APPARATUS FOR CHARGING RETORT-BENCHES. AUGUSTIN L. J. QUENEAU, South Bethlehem, Pa. Filed Jan. 16, 1905. Serial No. 241,274.

Claim.—1. An apparatus for charging retorts, comprising a charging-machine having impact-blades, a delivery-spout, and a

forced feed, and means for independently operating the blades and forced feed; substantially as described.

813,025. ICE-VELOCIPEDE. HENRY SCHENCKLOTH, Holstein, Iowa. Filed Oct. 17, 1904. Serial No. 228,606.

Claim.—1. A crown-protector for hats, comprising an open-work frame composed of spring material and shaped to fit the interior of the crown, the lower portion or base of the said protector being so shaped as to fit between the sweat-band and the crown of the hat, and removably secure the protector in position within the hat, substantially as described.

2. The herein-described form-retainer and crown-protector for hats, comprising an open-work frame composed of spring material and so shaped as to fit the interior of the crown, said frame being adapted to be inserted into the crown of the hat and secured therein, and the size of the bottom portion of the frame being adjustable, substantially as shown and described.

3. A crown-protector for hats, comprising an open-work frame of spring material shaped to fit the interior of the crown, the base being composed of a flat strip adapted to be placed between the sweat-band and the hat, and removably secure the protector in place, substantially as described.

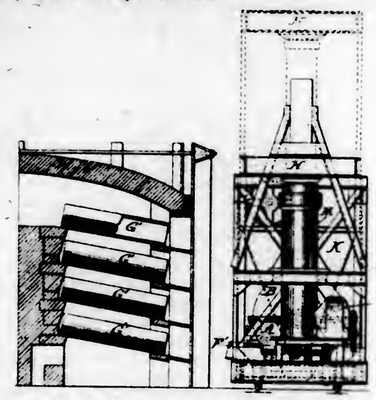
4. The combination with the crown of the hat of a form retainer and protector, comprising an open-work frame composed of spring material and so shaped as to fit the interior of the crown, said frame being inserted into the crown and secured therein, and the size of the bottom portion of the frame being adjustable, substantially as shown and described.

ends and arms connected to the outer ends of the lazy-tongs-lever members.

8. In a propeller, two vertical shafts, arms fixed to the shafts

nected to the carrier, slot-and-pin connections between the lever and valve-plate, and a plurality of springs between the valve-plate and the carrier.

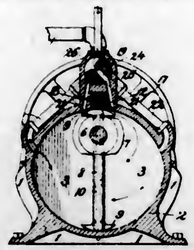
forced feed, and means for independently operating the blades and forced feed; substantially as described.



2. An apparatus for charging a bench of retorts, comprising a charging-machine having impact-blades and a delivery-spout for impelling and directing the charge, a hopper, a feed-screw located at the bottom of the hopper and communicating with the inlet-opening of the charging-machine and means for operating the charging-machine independently of the feed-screw; substantially as described.

3. An apparatus for charging a bench of retorts, comprising a charging-machine having impact-blades and a delivery-spout for impelling and directing the charge, a hopper, and a feed-screw located at the bottom of the hopper and communicating with the inlet-opening of the charging-machine, means for operating the charging-machine independently of the feed-screw a platform carrying the charging-machine, feed-screw and hopper, and hydraulic cylinders for raising and lowering the platform; substantially as described.

813,024. **ROTARY ENGINE.** JACOB H. RENNER, Canal Dover, Ohio. Filed Feb. 23, 1905. Serial No. 247,080.



Claim.—1. The combination, in a rotary engine, of a rotary eccentric piston, comprising a revoluble slotted drum and sliding piston, the cylinder and cylinder-heads thereof, with the shiftable shaft-bearing bushings, and piston-rings having the circular elastic-metal followers, substantially as shown and described.

2. In a rotary engine, the combination of the shiftable shaft-bearing bushings and the piston-drum having the circular elastic-metal followers and piston-rings, substantially as set forth.

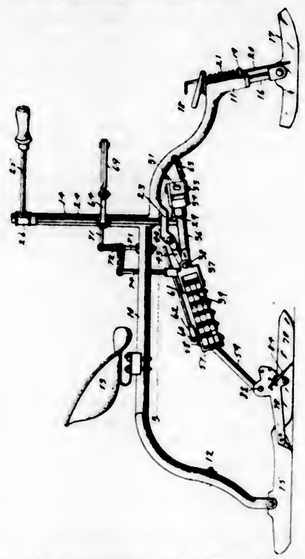
3. In a rotary engine, the semicircular flanges cast on cylinder at head ends flush with outer edge of bearing-sleeves and brackets, substantially as shown and described.

4. In a rotary engine, the combination of the cylinder, the revoluble piston-drum and sliding piston, with the projecting winged side contact-bars, the spurs on them, and the corresponding slots in piston-plate, substantially as set forth.

5. In a rotary engine, the combination of the projecting winged side contact-bars, the spurs on them and the corresponding slots in the piston-plate, substantially as described.

6. In a rotary engine, a cylinder with the upper extension, comprising a taper valve-bore, with inlets and outlets, the taper valve-core, with inlet and outlet slot, the threaded valve-stem, washer and nut, the operating-handle and notched guide below it, substantially as shown and described.

813,025. **ICE-VELOCIPEDE.** HENRY SCHNECKLOTH, Holstein, Iowa. Filed Oct. 17, 1904. Serial No. 228,606.



Claim.—1. The combination of a vehicle-frame, two shafts mounted in the vehicle-frame, means for jointly rocking said shafts, arms on the shafts, a lazy-tongs lever pivoted at one end of the machine-frame, means for connecting said arms with the lazy-tongs lever to extend and to fold the lazy-tongs lever when the shafts are rocked.

2. A vehicle-frame, two shafts mounted in the frame, pinions on the shafts in mesh with each other, operating-handles on the shafts, arms on the shafts projected laterally in opposite directions, rods pivoted to said arms, a lazy-tongs lever pivotally supported at one end on the vehicle-frame and having said rods pivoted thereto.

3. A vehicle-frame, two upright shafts in the frame, means for jointly rocking the shafts, arms projecting outwardly from the shafts in opposite directions, rods connected with said arms to permit limited, universal movement of the rods relative to the arms, a lazy-tongs lever pivoted at one end of the vehicle-frame and having said rods pivoted to the opposite ends of the lazy-tongs-lever members adjacent to the pivoted end thereof.

4. An ice-velocipede comprising an arched frame member, a rear fork, runners pivoted to the rear fork, a seat carried by the arched frame member, a steering-head at the front of the arched member, a rod mounted in the steering-head, a runner pivoted to the lower end of said rod, a steering foot-rest at the top of said rod, handle-levers supported between the foot-rest and seat and a propelling device operated by the handle-levers.

5. An ice-velocipede comprising an arched frame member, a rear fork, runners pivoted to the rear fork, a seat carried by the arched frame member, a steering-head at the front of the arched member, a rod mounted in the steering-head, a runner pivoted to the lower end of said rod, a steering foot-rest at the top of said rod, handle-levers supported between the foot-rest and seat and a propelling device operated by the handle-levers, a brake-rod mounted on the steering-head susceptible of being pushed downwardly by the operator's foot to engage the surface on which the vehicle is resting and a spring for elevating it.

6. In a propelling device, a lazy-tongs lever having the lever members at one end pivoted together only at their ends, a pivoted arm connected to said lever members to pivotally support the lazy-tongs lever, arms pivoted to the outer ends of the lazy-tongs-lever members at the pivotally-supported end of the lazy-tongs lever and a sharpened projection carried by the other end of the lazy-tongs lever.

7. In a propeller, a lazy-tongs lever, the two members at one end thereof inclined toward each other and away from the adjacent members to greater degrees than the other lever members are inclined relative to each other, said end members pivotally supported at their ends and arms connected to the outer ends of the lazy-tongs-lever members.

8. In a propeller, two vertical shafts, arms fixed to the shafts and projected laterally in opposite directions, rods connected to said arms and capable of limited universal movement relative thereto, yokes pivoted to the other ends of said rods, a lazy-tongs lever having the lever members at one end pivoted in said yokes, lever members connected with said yokes extended forwardly with their ends adjacent to each other, an arm having said lever members pivoted thereto and means for pivotally supporting said arm to swing vertically.

9. In a lazy-tongs lever, the combination of a lazy-tongs member, a disk thereon having a central opening and a ball-groove on one surface, a second lever member having a disk thereon provided with a central opening and ball-grooves on both surfaces, a third disk having a central opening and a ball-groove on one surface, a bolt passed through the said central openings and bearing-balls in said grooves.

10. The combination of a runner, an arm pivoted to the runner, a pointed projection carried by the arm, said arm formed with a slot concentric to its pivot-point, a reciprocating rod connected to the arm above its pivot-point, limiting-pins fixed to the arm and a short shaft mounted in the runner projected through the slot of the arm, a lever fixed to said shaft one end of a length to project below the runner and when swung to a rearward inclined position elevating the arm by engaging the limiting-pin and when swung to its other position lowering the rear end of the arm by engaging the other limiting-pin.

813,026. **PEANUT-VENDER.** JOHN C. SHERRING, Baltimore, Md. Filed Mar. 27, 1905. Serial No. 252,193.

Claim.—1. In a peanut-vender, a hopper having a discharge-opening, and a table situated below the said hopper, combined with a carriage adapted to have a sliding movement on the table toward and from the said opening in the hopper, and means to sweep the contents of the carriage from the carriage to a discharge-aperture in the table at each outward movement of the carriage, substantially as specified.

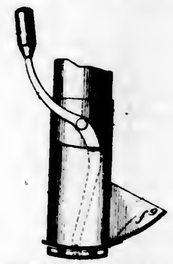
2. In a peanut-vender, a hopper having a discharge-opening, combined with a table situated under the said hopper, the said table having a discharge-aperture therein, combined with a carriage adapted to have a sliding movement on the table, toward and from the said opening, means whereby the said carriage may be drawn forward and so disclose the discharge-aperture, and a device to sweep the contents of the carriage over the edge of the same and into the discharge-aperture, substantially as specified.

813,027. **DISPENSING APPARATUS.** BENNETT TALBERT, Fresno, Cal. Filed July 13, 1904. Serial No. 216,327.

Claim.—1. In a dispensing apparatus the combination with a plurality of compartments, a delivery-chute for each compartment, a valve device for each delivery-chute comprising a valve-plate, and a cup or receptacle for each delivery-chute provided with an opening, which opening is controlled by the valve-plate.

2. In a dispensing apparatus the combination of a receptacle, a delivery-orifice for said receptacle, an auxiliary receptacle, a delivery-orifice for said auxiliary receptacle, and a valve adapted to control both of said orifices.

3. In a dispensing apparatus the combination of a receptacle, a delivery-chute for said receptacle, a valve-plate engaging the end of the chute, a carrier, a lever pivoted on the chute and pivotally connected to the carrier, slot-and-pin connections between the lever and valve-plate, and a plurality of springs between the valve-plate and the carrier.



4. In a dispensing apparatus the combination of a main receptacle having a delivery-orifice, an auxiliary receptacle having a delivery-orifice adjacent to but independent of that of the main receptacle, and a spring-seated valve-plate for controlling the discharge from both orifices.

813,028. **SEWER-CLEANER.** JOHN M. THOMPSON, Buffalo, N. Y., assignor of one-half to Thomas W. Kennedy and one-fourth to William N. La Tour, Buffalo, N. Y. Filed Aug. 7, 1905. Serial No. 273,147.

Claim.—1. In a sewer-cleaning device, the combination of a shell or cylinder provided with a cutting edge, and a second cutting edge arranged in advance of the former and disposed inwardly therefrom, substantially as set forth.

2. In a sewer-cleaning device, the combination of inner and outer connected shells or cylinders having cutting end edges, substantially as set forth.

3. In a sewer-cleaning device, the combination of inner and outer spaced shells or cylinders having cutting end edges, and means between the shells or cylinders for preventing the passage of material therethrough, substantially as set forth.

4. In a sewer-cleaning device, the combination of inner and outer spaced shells or cylinders having cutting end edges, and imperforate annular walls or webs connecting such shells or cylinders, substantially as set forth.

5. In a sewer-cleaning device, the combination of inner and outer connected shells or cylinders having cutting end edges, said inner shell or cylinder being of greater length than said outer shell or cylinder, substantially as set forth.

6. In a sewer-cleaning device, the combination of inner and outer connected shells or cylinders having serrated cutting end edges, the cutting edge of the inner cylinder being arranged in advance of the cutting edge of the outer cylinder, substantially as set forth.

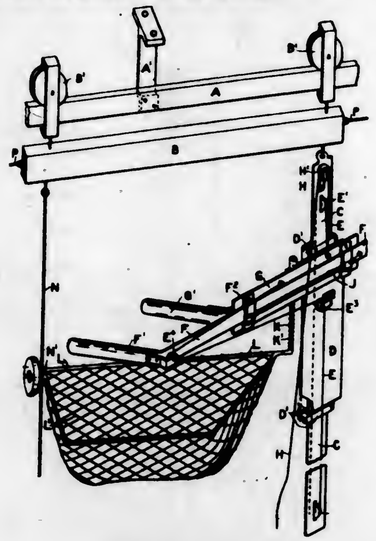
7. In a sewer-cleaning device, the combination of a shell or cylinder having a cutting edge, longitudinal shoes on the cylinder extending beyond the ends thereof, and an attaching device for draft means connected to the cylinder, substantially as set forth.

813,029. **APPARATUS FOR REMOVING ARTICLES FROM SHELVES.** GEORGE WARD, Roma, Queensland, Australia. Filed Oct. 31, 1905. Serial No. 285,247.

Claim.—1. A carriage traveling on an overhead rail having loosely suspended therefrom by one end a flat bar carrying on it a saddle capable of being moved up and down on the bar by means of a cord and sheaves, said saddle having on it a fixed arm and a movable arm, the latter being operated by a cord and sheaves and a spring.

2. A carriage traveling on an overhead rail having loosely suspended therefrom by one end a flat bar carrying on it a saddle capable of being moved up and down on the bar by means of a cord and sheaves, said saddle having a fixed arm and a movable arm, the latter being operated by a cord and sheaves and a spring; a net on a frame pivoted on the fixed arm and kept in its normal position by a spring

said net-frame being steadied when in motion by a rod loosely suspended from the carriage passing through a hole in the frame, a roller being also provided for passing obstacles.



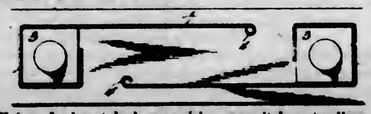
813,080. EYEGLASSES. JOEL C. WELLS, Southbridge, Mass. Filed Apr. 16, 1903. Serial No. 152,837.

Claim.—1. In eyeglass-mountings, the combination with the nose-bridge, the nose-guards pivotally supported at the ends of the nose-bridge, and screws or rivets for pivotally supporting the nose-guards, of a coil-spring for each nose-guard, having the coiled part in line with, and extending in the same vertical plane as said screws or rivets, and supported independently of the support of the nose-guard, and held at one end, and engaging the nose-guard at its other end, substantially as shown and described.

2. In eyeglasses, the combination with the lens straps, or frames, a nose-bridge secured thereto and having its ends carved or bent, and the extreme ends bent to extend at right angles to the plane of the lenses, and nose-guards having a supporting-arm pivotally attached to said ends by screws or rivets, of a spring for each nose-guard, independent of the pivot screw or rivet of the nose-guard, and comprising one or more coils, a projecting end to be secured to the lens strap or frame, and an end to engage the nose-guard or its supporting-arm, substantially as shown and described.

3. In eyeglasses, the combination with the lens straps or frames, a nose-bridge secured thereto, and nose-guards having a supporting-arm pivotally attached by a screw or rivet, and an engaging and extending beyond said screw or rivet, of a spring for each nose-guard, independent of said screw or rivet and located at one end thereof, and having the coiled part in line with, and extending in the same vertical plane as said screw or rivet, and having projecting ends, one secured to the lens strap or frame, and the other engaging the nose-guard-supporting arm, substantially as shown and described.

813,081. NUT-LOCK. AARON B. ALLEN, Pueblo, Colo. Filed Mar. 21, 1905. Serial No. 251,204.



Claim.—1. A nut-lock comprising oppositely-extending rods having overlapping hooked ends slidably connecting each other, and angular extensions formed by the rods and adapted to receive nuts therein.

2. A nut-lock comprising oppositely-disposed, similar hooked rods overlapping and slidably connected, each of said rods having an angular extension adapted to receive and fit snugly upon a nut.

813,082. LOAD-BINDER. CHARLES W. BAKER, Paw Paw, Mich. Filed Nov. 4, 1904. Serial No. 231,430.

Claim.—1. In a load-binder, the combination of the binding-ropes adapted to be secured to the wagon body or rack; a binding-board; brackets at each end thereof; rollers carried by said brackets over which said binding-ropes are arranged; truss-rods for said binding-board arranged through said brackets; pulley-blocks having tapered side plates and sheaves of varying diameters; hooks for said blocks adapted to receive said binding-ropes; and a fall or tackle rope rove first over the inner and thence over the outer sheaves, whereby said fall may be secured in its adjusted position by looping the hauling end thereof under one of the inner reaches thereof and drawing against one of the inner sheaves, for the purpose specified.

2. In a load-binder, the combination of the binding-ropes adapted to be secured to the wagon body or rack; a binding-board; brackets at each end thereof; rollers carried by said brackets over which said binding-ropes are arranged; pulley-blocks having tapered side plates and sheaves of varying diameters; hooks for said blocks adapted to receive said binding-ropes; and a fall or tackle rope rove first over the inner and thence over the outer sheaves, whereby said fall may be secured in its adjusted position by looping the hauling end thereof under one of the inner reaches thereof and drawing against one of the inner sheaves, for the purpose specified.

3. In a load-binder, the combination of the binding-ropes adapted to be secured to the wagon body or rack; a binding-board; brackets at each end thereof; rollers carried by said brackets over which said binding-ropes are arranged; truss-rods for said binding-board arranged through said brackets; and a tackle arranged on said binding-board between said rollers, for the purpose specified.

4. In a load-binder, the combination of the binding-ropes adapted to be secured to the wagon body or rack; a binding-board; brackets at each end thereof; rollers carried by said brackets over which said binding-ropes are arranged; and a tackle arranged on said binding-board between said rollers, for the purpose specified.

5. In a load-binder, the combination of the binding-ropes adapted to be secured to the wagon body or rack; a binding-board; rollers carried by said binding-board over which said binding-ropes are arranged; pulley-blocks having tapered side plates and sheaves of varying diameters; hooks for said blocks adapted to receive said binding-ropes; and a fall or tackle rope rove first over the inner and thence over the outer sheaves, whereby said fall may be secured in its adjusted position by looping the hauling end thereof under one of the inner reaches thereof and drawing against one of the inner sheaves, for the purpose specified.

6. In a load-binder, the combination of the binding-ropes adapted to be secured to the wagon body or rack; a binding-board; rollers carried by said binding-board over which said binding-ropes are arranged; and a tackle arranged on said binding-board between said rollers, for the purpose specified.

813,083. TUBE-CLIP. FREDERICK A. BELLAMY, London, England. Filed May 16, 1905. Serial No. 260,716.

Claim.—1. A flat metallic strip having a widened portion near one end and a short aperture in said widened portion, said strip being formed into a constrictive clamp by passing one end of the strip through said aperture and coiling the strip so that one portion of the coil lies outside an inner portion thereof.

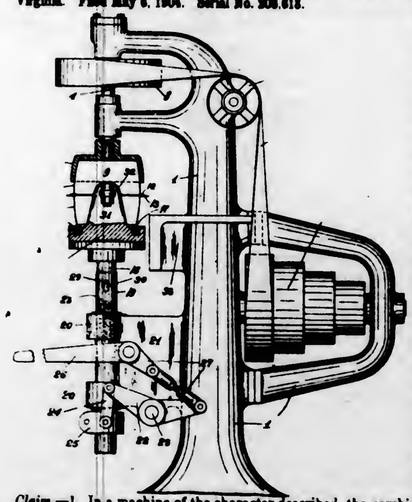
2. A flat metallic strip having a widened portion near one end and a short aperture in said widened portion, said strip being formed into a constrictive clamp by passing one end of the strip through said aperture and coiling the strip so that one portion of the coil lies outside an inner portion thereof, and also having a short part of each end of said strip turned out at a right angle to the rest of the clip and perforated to accommodate a bolt for tightening the clip by means of a nut or the like.

3. A tube-clip consisting of a coiled metallic strip so formed that a single coil of uniform width encircles the tube to be clamped and a portion of said strip passes through an aperture thereof and encircles the first coil mentioned, and having bent portions of said strip adapted to receive a locking device such as a bolt and nut.

4. A tube-clip consisting of a coiled metallic strip, so formed that a single coil encircles the tube to be clamped and a portion of said strip passes through an aperture thereof and encircles the first coil mentioned, and having bent portions of said strip adapted to receive a locking device such as a bolt and nut.

5. A tube-clip consisting of a coiled metallic strip so formed that a single coil encircles and contacts with the tube to be clamped and a portion of said strip passes through an aperture therein and encircles the coil first mentioned.

813,084. SEAMING-MACHINE. OTTO S. BEYER, East Rutherford, N. J., assignor to H. W. Bliss Company, a Corporation of West Virginia. Filed May 6, 1904. Serial No. 206,618.



Claim.—1. In a machine of the character described, the combination of a rotating clamp, a vertically-movable work-supporter, bearings for slidably supporting the said work-supporter, a bell-crank, links connecting said bell-crank to the work-supporter, a pivoted operating-lever, and toggles connecting the said operating-lever and bell-crank.

2. In a machine of the character set forth, the combination of a rotating clamp, a work-supporter, a vertically-movable sleeve, bearings slidably supporting said sleeve, a spindle carrying the work-supporter mounted in the sleeve, a spring-cushion in the said sleeve on which the said spindle rests, a bell-crank, links connecting said bell-crank to the sleeve, a pivoted operating-lever, and toggles connecting the said operating-lever and bell-crank.

3. The combination with a non-rotating work-supporter on which the work is adapted to rotate, of a bracket on the framework, seaming members located on one side of the said work-supporter, and means on the opposite side of the said work-supporter for imparting the thrust to the said bracket.

4. The combination with a non-rotating work-supporter on which the work is adapted to rotate, of a bracket on the framework, seaming members located on one side of the said work-supporter, and shoulders on the work-supporter and on the bracket in apposition to each other located on the side opposite to that of the seaming members for imparting the thrust to the said bracket.

5. The combination with a non-rotating work-supporter on which the work is adapted to rotate, of a bracket on the framework, seaming members located on one side of the said work-supporter, a shoulder on the bracket located on the opposite side of the work-supporter, and shoulders on the work-supporter in apposition to the shoulder on the bracket for imparting the thrust to the said bracket.

6. The combination with a non-rotating work-supporter on which the work is adapted to rotate, of a bracket on the framework, seaming members located on one side of the said work-supporter, a shoulder on the bracket located on the opposite side of the said work-supporter, a shoulder on the work-supporter in apposition to the shoulder on the bracket for imparting the direct thrust of the seaming members to the said bracket, and a second shoulder on the said work-supporter also in apposition to the shoulder on the bracket for imparting the torsional thrust due to rotation to the bracket.

7. The combination with a non-rotating work-supporter on which the work is adapted to rotate, of a gooseneck stationary on the work-supporter and carrying a truck-roller adapted to contact with the inside of the can, a bracket on the framework, seaming members located on one side of the said work-supporter and adjacent to the truck-roller on the gooseneck, and means on the opposite side of the said work-supporter for imparting the thrust to the bracket.

8. The combination with a non-rotating work-supporter on which the work is adapted to rotate, of a gooseneck stationary on the work-supporter and carrying a truck-roller adapted to contact with the inside of the can, a bracket on the framework, seaming members located on one side of the said work-supporter, and shoulders on the work-supporter and on the bracket in apposition to each other located on the side opposite to that of the seaming members for imparting the thrust to the said bracket.

9. The combination with a non-rotating work-supporter on which the work is adapted to rotate, of a gooseneck stationary on the work-supporter and carrying a truck-roller adapted to contact with the inside of the can, a bracket on the framework, seaming members located on one side of the said work-supporter and adjacent to the truck-roller on the gooseneck, a shoulder on the bracket located on the opposite side of the said work-supporter, and shoulders on the work-supporter in apposition to the shoulder on the bracket for imparting the thrust to the bracket.

10. The combination with a non-rotating work-supporter on which the work is adapted to rotate, of a gooseneck stationary on the work-supporter and carrying a truck-roller adapted to contact with the inside of the can, a bracket on the framework, seaming members located on one side of the said work-supporter and adjacent to the truck-roller on the gooseneck, a shoulder on the bracket located on the opposite side of the said work-supporter, a shoulder on the work-supporter in apposition to the shoulder on the bracket for imparting the direct thrust of the seaming members to the said bracket, and a second shoulder on the said work-supporter also in apposition to the shoulder on the bracket for imparting the torsional thrust due to rotation to the bracket.

11. The combination with a non-rotating work-supporter on which the work is adapted to rotate, of a bracket on the framework, angular plates adjustably secured to the bracket on either side of the said work-supporter, seaming members on one of said angular plates, a shoulder on the other of said angular plates, a shoulder on the work-supporter for imparting the direct thrust of the seaming members to the bracket and a second shoulder on the work-supporter adapted to impart the torsional thrust to the said angular plate.

12. The combination with a non-rotating work-supporter on which the work is adapted to rotate, of a gooseneck stationary on the work-supporter and carrying a truck-roller adapted to contact with the inside of the can, a bracket on the framework, angular plates adjustably secured to the bracket on either side of the said work-supporter, seaming members on one of said angular plates, a shoulder on the other of said angular plates, a shoulder on the work-supporter for imparting the direct thrust of the seaming members to the bracket, and a second shoulder on the work-supporter adapted to impart the torsional thrust to the said angular plate.

813,085. SPRING-WHEEL. FRANK A. BORN, Grover, S. D. Filed May 17, 1905. Serial No. 260,874.

Claim.—1. The combination with a wheel including inner and outer spaced rims, pairs of brackets carried by the outer rim, a rod slidably engaged in each pair of brackets, plungers having passages therein in which the rods are engaged between the brackets, said plunger being slidably engaged in the inner rim, helical springs engaged with the rods between the plungers and the brackets, helical springs engaged with the rods outwardly of the brackets, washers engaged with the rods outwardly of the last-named helical springs and cotter-pins engaged in the rods beyond the washers, and means for holding the outer rim yieldably against movement toward the inner rim.

2. The combination with a wheel including inner and outer spaced rims, pairs of brackets carried by the outer rim, a rod slidably engaged in each pair of brackets, plungers having passages therein in which the rods are engaged between the brackets, said plunger being slidably engaged in the inner rim, helical springs engaged with the rods between the plungers and the brackets, helical springs engaged with the rods outwardly of the brackets, washers engaged with the rods outwardly of the last-named helical springs and cotter-pins engaged in the rods beyond the washers, and means for holding the outer rim yieldably against movement toward the inner rim, said means comprising a bell-crank lever pivoted to the inner rim, a link connecting the bell-crank lever to the outer rim, and a spring connected to the bell-crank lever.

813,086. CAN-OPENER. ALBERT E. BOSWORTH, Chicago, Ill. Filed Aug. 15, 1904. Serial No. 220,966.

Claim.—1. A can-opener comprising a handle, a jaw pivoted thereto, a cutting-wheel carried by said jaw, a second jaw pivoted to the handle, a cutting-wheel carried by said second jaw, and a spring connected to the handle and to the first-named jaw, substantially as described.

2. A can-opener comprising a handle, a jaw pivoted thereto, a cutting-wheel carried by said jaw, a second jaw pivoted to the handle, a cutting-wheel carried by said second jaw, a spring connected to the handle and to the first-named jaw, and a stop on the handle for limiting the movement of the first-named jaw, substantially as described.

3. A can-opener comprising a handle, a jaw pivoted thereto, a cutting-wheel carried by said jaw, a second jaw pivoted to the handle, a cutting-wheel carried by said second jaw, a spring connected to the handle and to the first-named jaw, and a stop on the handle for limiting the movement of the first-named jaw, said stop being adjustable, substantially as described.

4. A can-opener comprising a handle, a jaw pivoted thereto, a cutting-wheel carried by said jaw, a second jaw pivoted to the handle, a cutting-wheel carried by said second jaw, a spring connected to the handle and to the first-named jaw, and a stop on the handle for limiting the movement of the first-named jaw, said stop being adjustable and comprising a screw, substantially as described.

813,087. CAN-OPENER. ALBERT E. BOSWORTH, Chicago, Ill. Filed Aug. 15, 1904. Serial No. 220,967.

Claim.—1. A can-opener comprising a handle, a jaw pivoted thereto, a cutting-wheel carried by said jaw, a second jaw pivoted to the handle, a cutting-wheel carried by said second jaw, and a spring connected to the handle and to the first-named jaw, substantially as described.

2. A can-opener comprising a handle, a jaw pivoted thereto, a cutting-wheel carried by said jaw, a second jaw pivoted to the handle, a cutting-wheel carried by said second jaw, a spring connected to the handle and to the first-named jaw, and a stop on the handle for limiting the movement of the first-named jaw, substantially as described.

3. A can-opener comprising a handle, a jaw pivoted thereto, a cutting-wheel carried by said jaw, a second jaw pivoted to the handle, a cutting-wheel carried by said second jaw, a spring connected to the handle and to the first-named jaw, and a stop on the handle for limiting the movement of the first-named jaw, said stop being adjustable, substantially as described.

4. A can-opener comprising a handle, a jaw pivoted thereto, a cutting-wheel carried by said jaw, a second jaw pivoted to the handle, a cutting-wheel carried by said second jaw, a spring connected to the handle and to the first-named jaw, and a stop on the handle for limiting the movement of the first-named jaw, said stop being adjustable and comprising a screw, substantially as described.

813,088. CAN-OPENER. ALBERT E. BOSWORTH, Chicago, Ill. Filed Aug. 15, 1904. Serial No. 220,968.

Claim.—1. A can-opener comprising a handle, a jaw pivoted thereto, a cutting-wheel carried by said jaw, a second jaw pivoted to the handle, a cutting-wheel carried by said second jaw, and a spring connected to the handle and to the first-named jaw, substantially as described.

2. A can-opener comprising a handle, a jaw pivoted thereto, a cutting-wheel carried by said jaw, a second jaw pivoted to the handle, a cutting-wheel carried by said second jaw, a spring connected to the handle and to the first-named jaw, and a stop on the handle for limiting the movement of the first-named jaw, substantially as described.

3. A can-opener comprising a handle, a jaw pivoted thereto, a cutting-wheel carried by said jaw, a second jaw pivoted to the handle, a cutting-wheel carried by said second jaw, a spring connected to the handle and to the first-named jaw, and a stop on the handle for limiting the movement of the first-named jaw, said stop being adjustable, substantially as described.

4. A can-opener comprising a handle, a jaw pivoted thereto, a cutting-wheel carried by said jaw, a second jaw pivoted to the handle, a cutting-wheel carried by said second jaw, a spring connected to the handle and to the first-named jaw, and a stop on the handle for limiting the movement of the first-named jaw, said stop being adjustable and comprising a screw, substantially as described.

813,089. CAN-OPENER. ALBERT E. BOSWORTH, Chicago, Ill. Filed Aug. 15, 1904. Serial No. 220,969.

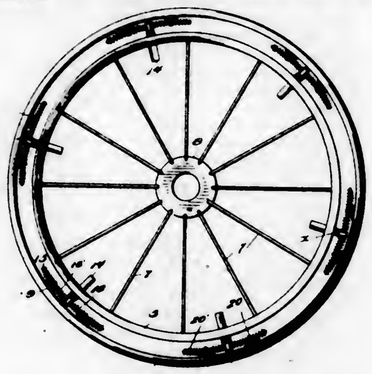
Claim.—1. A can-opener comprising a handle, a jaw pivoted thereto, a cutting-wheel carried by said jaw, a second jaw pivoted to the handle, a cutting-wheel carried by said second jaw, and a spring connected to the handle and to the first-named jaw, substantially as described.

2. A can-opener comprising a handle, a jaw pivoted thereto, a cutting-wheel carried by said jaw, a second jaw pivoted to the handle, a cutting-wheel carried by said second jaw, a spring connected to the handle and to the first-named jaw, and a stop on the handle for limiting the movement of the first-named jaw, substantially as described.

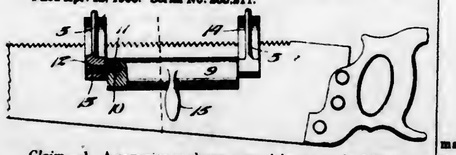
3. A can-opener comprising a handle, a jaw pivoted thereto, a cutting-wheel carried by said jaw, a second jaw pivoted to the handle, a cutting-wheel carried by said second jaw, a spring connected to the handle and to the first-named jaw, and a stop on the handle for limiting the movement of the first-named jaw, said stop being adjustable, substantially as described.

4. A can-opener comprising a handle, a jaw pivoted thereto, a cutting-wheel carried by said jaw, a second jaw pivoted to the handle, a cutting-wheel carried by said second jaw, a spring connected to the handle and to the first-named jaw, and a stop on the handle for limiting the movement of the first-named jaw, said stop being adjustable and comprising a screw, substantially as described.

2. The combination with a wheel including inner and outer spaced rims, pairs of brackets carried by the outer rim, a rod slidably engaged in each pair of brackets, said inner rim having openings formed therein, a bushing in each of said openings, a housing located above each of said bushings and communicating therewith, a plunger slidably engaged in each of said bushings and said housings and with the said rod intermediate between the said brackets, a helical spring engaged with the said plunger between said inner rim and said rod, helical springs engaged with the rods between the plungers and the brackets, helical springs engaged with the rods outwardly of the brackets, washers engaged with the rods outwardly of the last-named helical springs and cotter-pins engaged in the rods beyond the washers.



813,036. **SAW-CLAMP.** CHARLES W. CARDWELL, Jamaica, N. Y. Filed Apr. 13, 1905. Serial No. 255,211.



Claim.—1. A saw vise or clamp comprising an arched frame, an elongated jaw disposed at the base of the arch and fixed to one of the sides of the frame, an elongated clamping bar or roll eccentrically mounted upon the opposite side of the frame and coextensive in length with and disposed opposite said fixed jaw, and an operating-handle projecting from the outer side of the roll, substantially as described.

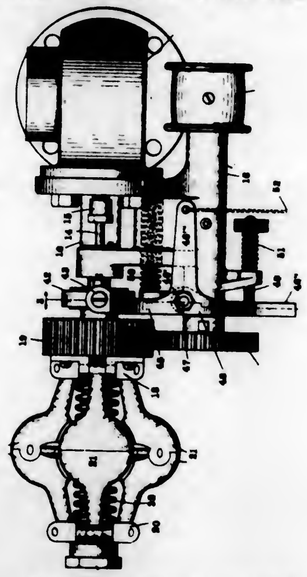
2. A saw vise or clamp comprising spaced brackets, each formed of inner and outer arms joined at their upper ends by a short arched portion, the inner arm being provided at its lower end with means for attaching the bracket to a support, an elongated jaw disposed at the base of the arch and fixedly attached to the inner arms, an elongated clamping bar or roll eccentrically mounted upon the outer arms of the brackets and coextensive in length with and disposed opposite the fixed jaw, and an operating-handle projecting from the outer side of the roll, substantially as described.

3. A saw vise or clamp comprising a frame provided with an elongated fixed jaw, an elongated clamping-roll eccentrically mounted upon the frame opposite said fixed jaw and coextensive in length therewith, said roll having a covering of resilient, non-resonant material completely enveloping the periphery thereof to prevent the emission of sound-vibrations from the saw and sympathetic vibrations from any portion of the roll, and an operating-handle applied to the roll.

4. A saw clamp or vise comprising an arched frame, an elongated clamping-jaw disposed at the base of the arch and fixed to one of the sides of the frame, a clamping bar or roll disposed opposite said fixed jaw and coextensive in length therewith, and connections pivotally mounting the roll eccentrically upon the outer side of the frame, each connection comprising a stem having a screw-threaded portion attached to one of the parts and a journal portion engaging the other part, one of said portions being set eccentric to the other portion.

5. A saw clamp or vise comprising an arched frame, an elongated jaw disposed at the base of the arch and fixed to the inner side of the frame, a clamping bar or roll disposed opposite said fixed jaw and coextensive in length therewith, and connections pivotally mounting the roll upon the outer side of the frame, each of said connections comprising a threaded stem fixedly engaging the bar or roll and an eccentric journal revolubly mounted in the frame.

813,037. **THROTTLING-GOVERNOR.** HARRY C. CLAY, Columbus, Ind., assignor to Reeves & Company, Columbus, Ind., a Corporation of Indiana. Filed Aug. 26, 1905. Serial No. 275,734.



Claim.—1. In a throttling-governor, the combination, with the main body, and its valve-seats, a valve mounted therein in conjunction with said seats, a valve-stem carrying said valve, a rotatable ball-head engaging said stem, means for rotating said ball-head, whereby variation in speed of rotation thereof will cause movement of the valve, and means for adjusting said ball-head bodily whereby the normal position of the valve relative to its seats may be varied.

2. In a throttling-governor, the combination, with the main body, and the valve and its stem, of a hollow spindle carried by said main body through which the valve-stem passes, a ball-head journaled on said spindle and bodily axially movable thereon, means for rotating the ball-head, and means for adjusting the ball-head bodily longitudinally on the spindle whereby the valve may be adjusted within the governor-body.

3. In a throttling-governor, the combination, with the main body, and the valve and its stem, of a hollow spindle carried by said main body through which the valve-stem passes, a ball-head journaled on said spindle and bodily axially movable thereon, means for rotating the ball-head, means for adjusting the ball-head bodily longitudinally on the spindle whereby the valve may be adjusted within the governor-body, and means for preventing rotative movement of the valve-stem.

4. In a throttling-governor, the combination, with the main body, and its valve-seats, a valve mounted therein in conjunction with said seats, a valve-stem carrying said valve, a rotatable ball-head engaging said stem, means for rotating said ball-head, whereby variation in speed of rotation thereof will cause movement of the valve, means for adjusting said ball-head bodily whereby the normal position of the valve relative to its seats may be varied, a special spring yieldingly holding the valve-stem in engagement with the ball-head, and attached at one end to the governor-body and at the other end to the valve-stem to prevent rotation of the valve.

5. In a throttling-governor, the combination, with the main body, and the valve and its stem, of a hollow spindle carried by said main body through which the valve-stem passes, a ball-head journaled on said spindle and bodily axially movable thereon, means for rotating the ball-head, means for adjusting the ball-head bodily longitudinally on the spindle whereby the valve may be adjusted within the governor-body, a sawyer's lever, intermediate connections between said lever and ball-head, adjustable means for holding said lever in one direction, and yielding means for holding said lever in the opposite direction.

6. In a throttling-governor, the combination, with the main body, and the valve and its stem, of a hollow spindle carried by said main body through which the valve-stem passes, a ball-head journaled on said spindle and bodily axially movable thereon, means for rotating the ball-head, a sawyer's lever, intermediate connections between said lever and ball-head, adjustable means for holding said lever in one direction, and yielding means for holding said lever in the opposite direction.

7. In a throttling-governor, the combination, with the main body, and the valve and its stem, of a hollow spindle carried by said main body through which the valve-stem passes, a ball-head journaled on said spindle and bodily axially movable thereon, means for rotating the ball-head, a sawyer's lever, a split collar having rotatable engagement with the inner member of the ball-head, a pair of pivot-pins carried by the sawyer's lever and engaging the members of the split collar to hold them in position, adjustable means for holding the sawyer's lever in one direction, and yielding means for holding said lever in the opposite direction.

8. In a throttling-governor, the combination, with the main body and the valve and its stem, of a hollow spindle carried by said main body through which the valve-stem passes, a pair of ball-spiders journaled on said spindle and axially movable thereon, a spur-gear carried by one of said spiders, a driving-gear meshing with said spur-gear, ball members connecting said spindles, a spring acting on said spiders, and means for adjusting the spiders axially on the spindle.

9. In a throttling-governor, the combination, with the main body and the valve and its stem, of a hollow spindle carried by said main body through which the valve-stem passes, a pair of ball-spiders journaled on said spindle and axially movable thereon, a spur-gear carried by one of said spiders, a driving-gear meshing with said spur-gear, ball members connecting said spiders, a spring acting on said spiders, a sawyer's lever, intermediate connections between said lever and ball-head, adjustable means for holding said lever in one direction, and yielding means for holding said lever in the opposite direction.

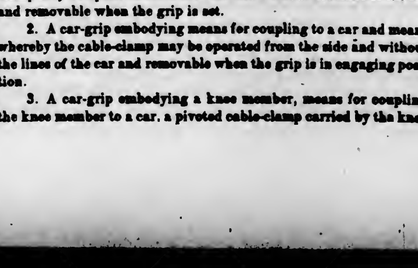
10. In a throttling-governor, the combination, with the main body and the valve and its stem, of a hollow spindle carried by said main body through which the valve-stem passes, a pair of ball-spiders journaled on said spindle and axially movable thereon, a spur-gear carried by one of said spiders, a driving-gear meshing with said spur-gear, ball members connecting said spiders, a spring acting on said spiders, a sawyer's lever, a split collar having rotatable engagement with the inner member of the ball-head, a pair of pivot-pins carried by the sawyer's lever and engaging the members of the split collar to hold them in position, adjustable means for holding the sawyer's lever in one direction, and yielding means for holding said lever in the opposite direction.

813,038. **NON-REFILLABLE BOTTLE.** MORTON CONNER, Rushville, Ind. Filed Aug. 31, 1905. Serial No. 276,113.

Claim.—1. In a device of the character described, the combination with the bottle-neck provided with an internally-formed annular recess, a spool to snugly fit the internal wall of the bottle-neck and provided with a longitudinal aperture, and also provided with a plurality of circumferentially-disposed channels, shoulders formed centrally of said spool and between said circumferentially-disposed channels, the combined length of said shoulders being less than the circumference of the spool to provide the transverse passage-ways between them, said shoulders being provided also with grooves that communicate with the peripheral surface of said shoulders, locking means engaging the annular recess in the bottle-neck and the grooves in the shoulders, the longitudinal ways extending from the top of the spool to the first circumferentially-disposed channel arranged so as to stand out of alinement of the transverse passage-ways that divide the shoulders, while the lower channel of the spool communicates with the longitudinal aperture in the spool by means of a horizontal aperture which is in alinement with the longitudinal ways in the upper end of the spool but out of alinement with the transverse passage-ways between the shoulders, a valve in the longitudinal aperture in the spool-body, and a separable seat for the valve.

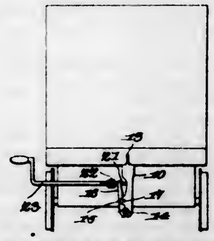
2. In a device of the character described, the combination with the bottle provided with an interaally-formed recess in the bottle-neck, a spool provided with outlet-apertures to be inserted into the neck of the bottle, locking means engaging both the recess in the bottle-neck and the spool, a valve for regulating the flow of liquid, and a separable base for the spool to form the seat for the valve.

813,039. **DOUBLETREE-HITCH.** JOHN H. COOK, Irving, Ill., assignor of one-half to Arthur Kinkead, Irving, Ill. Filed Apr. 5, 1905. Serial No. 253,973.



Claim.—In a device of the character set forth, an oblong casing closed at one end and open at the opposite end and provided with outwardly-extended terminal attaching extensions projecting below the lower side thereof to elevate the said casing and provide a space between it and the part to which the said casing may be secured, said casing having vertical and horizontal intersecting longitudinal slots and having inner flanges bordering upon the longitudinal slots, a yoke insertible in the casing through the open end thereof and prevented from lateral displacement by said inner longitudinal flanges, a doubletree freely movable in the horizontal slot and preventing outward displacement of the yoke, a pin connecting the doubletree with the yoke and having its end portions freely movable in the said vertical slot, securing means applied to the lower end of the pin and accessible through the space below the casing, and a spring arranged within the casing and confined between the closed end thereof and the yoke and normally exerting a pressure upon the yoke to hold it at the limit of its rearward movement.

813,040. **CABLE-GRIP FOR CARS.** JAMES L. DAVIS, Bramwell, Pa., assignor of one-fourth to Walter B. Chalfant, Bramwell, Pa. Filed Aug. 3, 1905. Serial No. 272,584.



Claim.—1. A car-grip embodying means whereby the cable-clamp may be operated from the side and without the lines of the car and removable when the grip is set.

2. A car-grip embodying means for coupling to a car and means whereby the cable-clamp may be operated from the side and without the lines of the car and removable when the grip is in engaging position.

3. A car-grip embodying a knee member, means for coupling the knee member to a car, a pivoted cable-clamp carried by the knee

member, and means for operating the clamp carried by the clamp member and exerting pressure against the knee member.

between said throttle-wheels and valve-stems, substantially as described.

gallery; of an annular shoulder on the tube, and upright ribs also on the tube adjacent to and tapering away from said shoulder and adapt-

view of retaining the same in alinement with each other, a pilot-wheel carried by the forward frame-section, a motor carried by the

member, and means for operating the clamp carried by the clamp member and exerting pressure against the knee member.

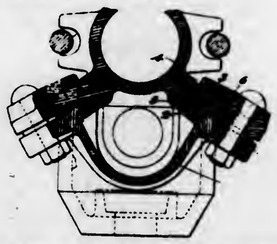
4. A car-grip embodying a knee member, means for coupling the knee member to a car, a pivoted cable-clamp carried by the knee member, and means whereby the clamp may be operated from the side and without the lines of the car and removable when the grip is in clamping position.

5. A car-grip embodying a knee member, means for coupling the knee member to a car, a cable-clamp pivotally mounted on the knee member and on a pivot longitudinal of the car and means carried by the clamp member and exerting pressure against the knee member and whereby the clamp may be operated from the side and without the lines of the car.

6. A car-grip embodying a knee member, means for coupling the knee member to a car, a cable-clamp pivotally mounted on the knee member and on a pivot longitudinally of the car, a screw mounted in the clamp member and engaging the knee member and an angular head on the screw and accessible from the side of the car.

7. A car-grip embodying a knee member carrying a pin for coupling with the draw-head of a car and having a groove at its lower extremity longitudinal of the car, a cable-grip member pivoted to the side of the knee member and having a groove in opposed relation to the groove of the knee member and a lever extending opposite and above the pivot, and a screw piercing the lever and bearing against the side of the knee member and having an angular head accessible from the side of the car.

813,041. **ROCK-DRILL.** DAVID C. DEMAREST, Angels Camp, Cal. Filed May 4, 1905. Serial No. 258,845.



Claim.—1. In a rock-drilling machine the combination of a shell and a cylinder supported thereon one of said parts having lugs and the other part having seats for said lugs, and means to clamp the cylinder to the shell said means including bolts passing through the caps and shell said shell having counterbores and said caps having bosses fitting said counterbores.

2. In a rock-drilling machine, the combination of a cylinder having lateral inclined lugs, a shell having correspondingly-inclined seats for said lugs, removable caps for the lugs, said caps having bosses on their under side and said shell having counterbores adapted to receive said bosses, and means to secure the caps to the shell.

813,042. **INVERTED INCANDESCENT GAS-BURNER.** HENRY FARNOFF, Buffalo, N. Y. Filed Aug. 2, 1905. Serial No. 272,200.

Claim.—1. In an inverted incandescent gas-burner, the combination with the Bunsen tube having air-inlets, and the mantle; of a valve-chamber screwed into said tube, a removable tapered tip for said chamber within the tube and extending past said inlets, the end of the tip having a plurality of orifices, a large one in the center and smaller ones at the sides, a gas-feed pipe tapped into the side of the chamber, a needle-valve threaded axially through the top of the chamber and having its point directed into the central of said orifices, a head at its upper end, and a coiled expansive spring upon its stem between said head and the chamber.

2. In an incandescent gas-burner, the combination with the Bunsen tube, and the globe; of a gallery for the globe, an annular shoulder on the tube, and ribs at right angles to and tapering away from said shoulder and adapted to receive the gallery.

3. In an inverted incandescent gas-burner, the combination with the Bunsen tube, the mantle at its lower end, a globe around the latter, a gallery for the globe, and a deflector standing above said gallery; of an annular shoulder on the tube, and upright ribs also on the tube adjacent to and tapering away from said shoulder and adapted to frictionally receive the hubs of the gallery and deflector.

4. In an inverted incandescent gas-burner, the combination with the air and the gas inlets, and the mantle; of a Bunsen tube having its bore tapered downward from the air-inlet for part of its length, a cylindrical nozzle, and an interior annular shoulder between said tapered bore and nozzle and facing toward the latter.

5. An inverted Bunsen burner having its bore tapered downward from the air-inlet for part of its length, and cylindrical for the remainder of its length in a plurality of sizes separated from each other and from the tapered portion by angular annular shoulders facing toward the nozzle.

6. In an inverted incandescent gas-burner, a Bunsen tube having a downwardly-tapering mixing-chamber, a cylindrical nozzle, a cylindrical bore between them, and an interior annular shoulder next the mixing-chamber and facing toward the nozzle.

7. In an inverted incandescent gas-burner, a substantially vertical Bunsen tube whose bore comprises two cylindrical portions of different diameter and a mixing-chamber tapered downward toward the nozzle, all separated from each other by angular annular shoulders.

8. In an incandescent gas-burner, the combination with the nozzle having two exterior annular shoulders with a groove between, the shoulder near the end being cut away at intervals, and a pin movable through the other shoulder opposite one of said intervals; of the mantle, a ring fast therein, and inturned tangs within the ring adapted to said intervals.

9. In an inverted incandescent gas-burner, the combination with the nozzle having exterior annular shoulders with a groove between the lower shoulder being cut away at intervals, a headed pin movable through a hole in the upper shoulder opposite one of said intervals, and another pin fixedly connecting the shoulders; of the mantle, a ring fast therein, and inturned tangs within the ring adapted to pass through said intervals.

10. In an inverted incandescent gas-burner, the combination with the nozzle having exterior shoulders with a groove between, the lower shoulder being cut away at intervals and the upper shoulder having a radial projection above one interval pierced with an upright hole, a pin mounted loosely in said hole and hanging normally across said groove, heads at the extremities of the pin, and a fixed stop between the shoulders at another point; of the mantle, a ring fast therein, and inturned tangs within the ring spaced to enter the intervals and adapted to the height of the groove.

11. In an inverted incandescent gas-burner, the combination with the nozzle having exterior shoulders with a groove between, the lower shoulder being cut away at intervals, a gravity-lock supported by the upper shoulder above one interval and hanging normally across said groove, and a fixed stop between the shoulders at another point; of the mantle, a metallic ring fast therein, inturned tangs at its upper end spaced to enter the intervals and one of them adapted to raise said lock as the ring is applied, and upturned inner extremities on said tangs adapted to fill the height of said groove.

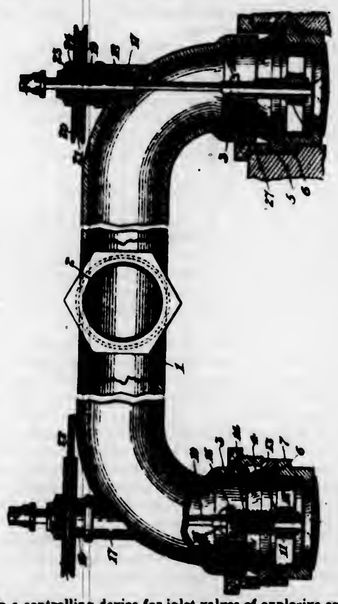
12. In an inverted incandescent gas-burner, the combination with a Bunsen tube having a mixing-chamber tapering downward toward the nozzle and an interior shoulder; of the gas-supply tip having a plurality of orifices, and a needle-valve regulator for one of them.

13. In an inverted incandescent gas-burner, the combination with a Bunsen tube having a mixing-chamber tapering downward toward the nozzle, a cylindrical nozzle and an interior shoulder between them; of the gas-supply tip, and a needle-valve regulator therefor.

14. In an inverted incandescent gas-burner, the combination with a substantially vertical Bunsen tube having downwardly-facing right-angular annular shoulders in its bore, and the air-inlets at its upper end; of the gas-supply tip directed into said upper end, and a needle-valve regulator therefor.

813,043. **VALVE-CONTROLLING MECHANISM FOR EXPLOSIVE-ENGINES.** DAVID F. GRAHAM and FRANK A. FOX, Stamford, Conn., assignors, by mesne assignments, to The Bissonbuth Horseless Vehicle Company, Middletown, Conn., a Corporation of Maine. Filed Mar. 11, 1903. Serial No. 147,236.

Claim.—1. In a controlling device for inlet-valves of explosive-engines, the combination with a vapor-pipe having a plurality of inlet-openings and valve-seats for said inlet-openings, of inlet-valves for controlling said openings, throttle-wheels, a connection between said wheels for causing them to operate in unison and connections between said throttle-wheels and valve-stems, substantially as described.



2. In a controlling device for inlet-valves of explosive-engines, the combination with a vapor-pipe having a plurality of inlet-openings and valve-seats for said inlet-openings, of inlet-valves for controlling said openings, throttle-wheels, a connection between said throttle-wheels for causing them to operate in unison, and adjustable connections between said throttle-wheels and valve-stems for adjusting said throttle-wheels to limit the withdrawal of the valves from the seats of said openings.

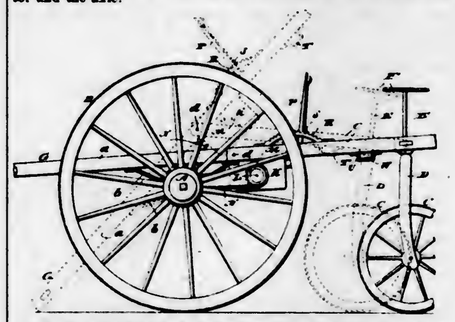
3. In a controlling device for inlet-valves of explosive-engines, the combination with a vapor-pipe having a plurality of inlet-openings and valve-seats for said inlet-openings, of inlet-valves for controlling said openings, throttle-wheels, an endless cable connecting said throttle-wheels for causing them to operate in unison, connections between said throttle-wheels and valve-stems for adjusting said throttle-wheels to limit the withdrawel of the valves from the seats of said openings, subtantially as described.

4. The combination with the vapor-pipe of an explosive-engine, of a union-coupling secured to the end of said pipe and provided with an annular flange having an annular recess in its under side, a valve-seat provided with an annular flange having an annular projection engaging said recess, a cylinder provided with an annular shoulder to receive the flange of the valve-seat and an upwardly-extending annular flange having interior threads, a valve for said seat, and a clamping nut or ring arranged to bear down on the flange of said coupling and clamp it and the flange of the valve-seat to the cylinder thereby holding the valve-seat in place.

5. In an explosive-engine, the combination with a vapor-pipe, and a plurality of valve-seats and valves for said seats, of externally-threaded bushings mounted in said pipe, stems connected to said valves and mounted to slide in said bushings and provided above said bushings with stops to limit their downward movement, throttle-wheels mounted to screw on said bushings and adapted to be raised or lowered thereon and to be engaged by said stops, and means for turning said wheels in unison, as set forth.

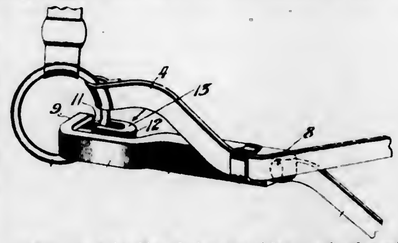
813,044. **MOTOR-VEHICLE.** PETER E. HANSON, Galveston, Tex. Filed June 24, 1905. Serial No. 266,782.

Claim.—1. A self-propelled, dumping-dray comprising an axle provided with and supported by traveling wheels, a main frame having a rear section connected with and arranged to swing vertically on the axle, and also having a forward section hinged to the rear section at a point in advance of the axle, whereby the frame is adapted to flex, means detachably connecting the said frame-sections with a view of retaining the same in alinement with each other, a pilot-wheel carried by the forward frame-section, a motor carried by the rear frame-section, and a driving connection intermediate said motor and the axle.



2. In a self-propelled, dumping-dray, the combination of an axle provided with and supported by traveling wheels, a main frame comprising a rear section connected with and arranged to swing vertically on the axle and having a transverse loop on its forward portion, and a forward section hinged to and lapping the forward portion of the rear section and having a transverse loop arranged to register with that of said rear section, a removable bar occupying said loops of the frame-sections, a hanger having an upwardly-extending shaft journaled in the forward frame-section and provided with a handle, a pilot-wheel carried by said hanger, a motor carried by the rear frame-section and connected with the axle, and means on said rear frame-section for controlling the motor.

813,045. **HITCHING DEVICE.** GEORGE W. HAZLEWOOD and HENRY C. ROBINSON, Mineral Wells, Tex. Filed Nov. 26, 1904. Serial No. 234,436.



Claim.—1. A hitching device comprising a pair of members pivoted for relative swinging movement, one of the members being provided with an open recess for the reception of a bit-ring, and the other with a portion for normally closing said opening.

2. A hitching device comprising a pair of members pivotally connected for relative movement, one of the members being provided with an outwardly-opening recess designed for the reception of a bit-ring and the other with a portion for normally closing said recess, and means for maintaining the members in closed position.

3. A hitching device comprising a pair of members pivotally connected for relative swinging movement, one of the members being provided with an outwardly-opening recess for the reception of a bit-ring and the other with a portion for normally closing said recess, and a spring-engaging member carried by one of the members and adapted for engagement with the other to maintain the members in normally closed position, the engaging member being designed for engagement by a rein to permit movement of the members to releasing position.

4. In a device of the class described, a hitching-strap, a hitching device carried thereby and adapted for engagement with a bit-ring, and a movable member operable by a rein for releasing the device from the bit-ring.

813,046. **WHARF OR LANDING-STAGE.** ANTOINE JANSSENS, St. Nicolas, Belgium. Filed Oct. 26, 1905. Serial No. 284,458.

Claim.—1. In a wharf the combination of a float or pontoon,

means for permitting said float to be automatically displaced in a horizontal and vertical direction by the action of the variations of the water-level, and means for giving access to the float in its differ-

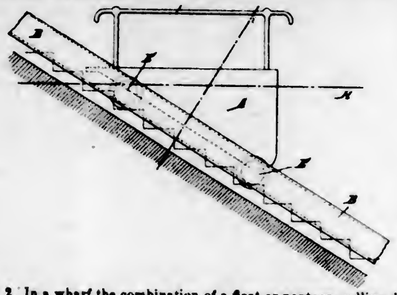
Claim.—1. In a device of the class described, the combination with a core, of a removable metal portion constructed to fit onto and surround said core and means for retaining said metal portion there-

Claim.—1. In a machine of the character set forth, the combination with an advance-feed mechanism, and a transverse-feed mechanism, of means for operating the said feed mechanisms periodically

periodically and alternately of each other, and means for operating the advance feed independently.

14. In a machine of the character set forth, the combination

means for permitting said float to be automatically displaced in a horizontal and vertical direction by the action of the variations of the water-level, and means for giving access to the float in its different positions substantially as described.



2. In a wharf the combination of a float or pontoon, rolling devices carried by said float, inclined paths for said rolling devices between which the float is automatically displaced in a horizontal and vertical direction and means between the roller-paths for giving access to the float, substantially as described.

813,047. **HOLDER.** LOUIS A. KING and CLARENCE PLOSS, Salem, Mass. Filed Feb. 7, 1905. Serial No. 244,563.

Claim.—1. A holder comprising a spring-wire clamp consisting of convolutions of the wire, the central portion of said wire bent forming a closed handle fulcrum-loop overhanging the convoluted clamp.

2. A holder comprising a single piece of spring-wire bent centrally between its ends forming a closed loop, the ends of said loop extended and forming depending arms, and the ends of the wire beyond said arms bent forming convolute clamping-jaws under the closed loop.

3. A holder comprising a piece of wire having its end portions bent forming convolute clamping-jaws, and having its central portion bent forming a closed fulcrum-loop over the clamping-jaws, said loop inclined upwardly at an obtuse angle to the horizontal plane of the clamping-jaws.

4. A holder, comprising a single spring-wire, bent between its ends forming a handle fulcrum-loop, and the ends bent forming angular clamping convolutions with bowed clamping members and flared entrance-guiding tongues at their outer ends.

5. A holder, comprising a block, a single spring-wire bent forming a spring-clamp secured to said block, and a fulcrum-loop above the clamp and secured to the block.

6. A holder, comprising a handle fulcrum-loop, and a spring-clamp below the same, each member of said clamp consisting of a plurality of convolutions and arms integral with said loop and clamp and connecting them.

7. In a holder, the combination with a block or support, of a wire bent centrally between its ends forming an outwardly-projecting loop, the wire below the loop projected downwardly and forming an eye under the loop, a fastening device passing through said eye and into the block or support, said wires depending from said eye and having their end portions bent forming convolute clamping-jaws, and fastening devices securing the extremities of the wire to the block or support.

813,048. **ANODE.** LOUIS LEVERT, New York, N. Y. Filed May 9, 1905. Serial No. 259,821.

Claim.—1. In a device of the class described, the combination with a core, of a removable metal portion constructed to fit onto and surround said core and means for retaining said metal portion thereon, substantially as described.

2. In a device of the class described, the combination with a core, of a metal portion constructed to fit onto and surround said core, means for retaining said metal portion thereon and insulating material covering the exposed portions of said core, substantially as described.

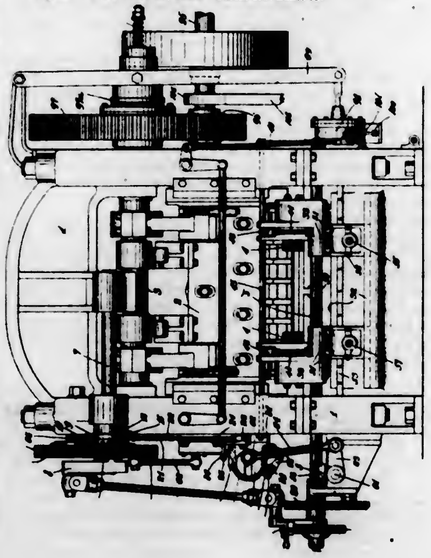
3. In a device of the class described, the combination with a core provided at its lower end with an enlarged portion, of a metal portion constructed to fit onto and surround said core, said metal portion being supported by said enlarged portion of said core, substantially as described.

4. In a device of the class described, the combination with a core provided at its lower end with an enlarged portion, of a metal portion constructed to fit onto and surround said core, said metal portion being supported by said enlarged portion of said core and insulating material covering the exposed portions of said core, substantially as described

5. In a device of the class described, the combination with a core provided at its lower end with an enlarged portion, of a metal portion constructed to fit onto and surround said core, said metal portion being tapered upwardly, the thickened end thereof resting upon the enlarged portion of said core, substantially as described.

6. In a device of the class described, the combination with a carbon plate provided at one end with ears and at its other end with an enlarged portion, of a metal portion constructed to fit onto and surround said carbon plate, said metal portion being tapered upwardly, the thickened end thereof resting upon the enlarged portion of said core, and insulating material covering the exposed portions of said carbon plate, substantially as described.

813,049. **PERFORATING-MACHINE.** BROR J. LINDGREN, New York, N. Y., assignor to B. W. Bliss Company, a Corporation of West Virginia. Filed June 17, 1904. Serial No. 213,948.



Claim.—1. In a machine of the character set forth, the combination with an advance-feed mechanism, and a transverse-feed mechanism, of means for operating the said feed mechanisms periodically or semiperiodically at will.

2. In a machine of the character set forth, the combination with an advance-feed mechanism, and a transverse-feed mechanism, of means for operating each of the said feed mechanisms periodically or semiperiodically at will independently one of the other.

3. In a machine of the character set forth, the combination with an advance-feed mechanism, and a transverse-feed mechanism, of means for operating the said feed mechanisms semiperiodically and alternately of each other.

4. In a machine of the character set forth, the combination with a pair of feed-rollers, of an advance-feed mechanism for rotating the rollers periodically or semiperiodically at will, and a transverse-feed mechanism for moving the feed-rollers transversely periodically or semiperiodically at will.

5. In a machine of the character set forth, the combination with a pair of feed-rollers, of an advance-feed mechanism adjustable to rotate the rollers periodically or semiperiodically at will, and a transverse-feed mechanism adjustable to move the feed-rollers transversely periodically or semiperiodically at will, each feed mechanism being adjustable one independently of the other.

6. In a machine of the character set forth, the combination with a pair of feed-rollers, of an advance-feed mechanism for rotating the rollers semiperiodically, and a transverse-feed mechanism for moving the rollers transversely semiperiodically, the said feed mechanisms acting alternately.

7. In a machine of the character set forth, the combination with a transversely-movable feed-roller frame, of a pair of feed-rollers carried by the same, an advance-feed shaft, means for rotating the said shaft intermittently, a train of gears, for imparting the motion of the advance-feed shaft to the feed-rollers, transversely movable with the feed-roller frame, a transverse-feed shaft attached to the feed-roller frame, and means for reciprocating the said transverse-feed shaft intermittently.

8. In a machine of the character set forth, the combination with a transversely-movable feed-roller frame, of a pair of feed-rollers carried by the same, an advance-feed shaft, means for rotating the said shaft intermittently and periodically or semiperiodically at will, a train of gears for imparting the motion of the advance-feed shaft to the feed-rollers, transversely movable with the feed-roller frame, a transverse-feed shaft attached to the feed-roller frame, and means for reciprocating the said transverse-feed shaft intermittently and periodically or semiperiodically at will.

9. In a machine of the character set forth, the combination with a transversely-movable feed-roller frame, of a pair of feed-rollers carried by the same, an advance-feed shaft, means for rotating the said shaft intermittently and adjustable to operate periodically or semiperiodically at will, a train of gears, for imparting the motion of the advance-feed shaft to the feed-rollers, transversely movable with the feed-roller frame, a transverse-feed shaft attached to the feed-roller frame, and means for reciprocating the said transverse-feed shaft intermittently and adjustable to operate periodically or semiperiodically at will, each means for operating the two feed-shafts being adjustable one independently of the other.

10. In a machine of the character set forth, the combination with a transversely-movable feed-roller frame, of a pair of feed-rollers carried by the same, an advance-feed shaft, means for rotating the said shaft intermittently and semiperiodically, a train of gears, for imparting the motion of the advance-feed shaft to the feed-rollers, transversely movable with the feed-roller frame, a transverse-feed shaft attached to the feed-roller frame, means for reciprocating the transverse-feed shaft semiperiodically, the means for operating the advance and transverse feed shafts acting alternately.

11. In a machine of the character set forth, the combination with an advance-feed mechanism, and a transverse-feed mechanism, of means for operating the said feed mechanisms in unison periodically or semiperiodically at will, and means for operating the advance feed independently.

12. In a machine of the character set forth, the combination with an advance-feed mechanism, and a transverse-feed mechanism, of means for operating the said feed mechanisms in unison each one independently adjustable of the other to operate periodically or semiperiodically at will, and means for operating the advance feed independently.

13. In a machine of the character set forth, the combination with an advance-feed mechanism, and a transverse-feed mechanism, of means for operating the said feed mechanisms in unison semiperiodically and alternately of each other, and means for operating the advance feed independently.

14. In a machine of the character set forth, the combination with a pair of feed-rollers, of an advance-feed mechanism for rotating the rollers periodically or semiperiodically at will, and a transverse-feed mechanism for moving the feed-rollers transversely periodically or semiperiodically at will in unison with the advance-feed mechanism, and means for operating the advance-feed mechanism independently.

15. In a machine of the character set forth, the combination with a pair of feed-rollers, of an advance-feed mechanism for rotating the rollers, a transverse-feed mechanism for moving the feed-rollers transversely in unison with the advance-feed mechanism, independently-adjustable means on the advance-feed mechanism and transverse-feed mechanism for causing each feed mechanism to operate periodically or semiperiodically at will, and means for operating the advance-feed mechanism independently.

16. In a machine of the character set forth, the combination with a pair of feed-rollers, of an advance-feed mechanism for rotating the rollers semiperiodically, and a transverse-feed mechanism for moving the rollers transversely semiperiodically, the said feed mechanisms acting in unison and alternately, and means for operating the advance-feed mechanism independently.

17. In a machine of the character set forth, the combination with a transversely-movable feed-roller frame, of a pair of feed-rollers carried by the same, an advance-feed shaft, a train of gears, for imparting the motion of the advance-feed shaft to the feed-rollers, transversely movable with the feed-roller frame, a transverse-feed shaft attached to the feed-roller frame, and means for rotating the advance-feed shaft and for reciprocating the said transverse-feed shaft intermittently and in unison, and means for operating the advance-feed shaft independently.

18. In a machine of the character set forth, the combination with a transversely-movable feed-roller frame, a pair of feed-rollers carried by the same, an advance-feed shaft, a train of gears for imparting the motion of the advance-feed shaft to the feed-rollers, transversely movable with the feed-roller frame, a transverse-feed shaft attached to the feed-roller frame, and means for rotating the advance-feed shaft and reciprocating the said transverse-feed shaft intermittently in unison and periodically or semiperiodically at will, and means for operating the advance-feed shaft independently.

19. In a machine of the character set forth, the combination with a transversely-movable feed-roller frame, of a pair of feed-rollers carried by the same, an advance-feed shaft, a train of gears, for imparting the motion of the advance-feed shaft to the feed-rollers, transversely movable with the feed-roller frame, a transverse-feed shaft attached to the feed-roller frame, and means for rotating the advance-feed shaft and reciprocating the said transverse-feed shaft intermittently and in unison, independently adjustable to operate periodically or semiperiodically at will, and means for operating the advance-feed shaft independently.

20. In a machine of the character set forth, the combination with a transversely-movable feed-roller frame, of a pair of feed-rollers carried by the same, an advance-feed shaft, a train of gears, for imparting the motion of the advance-feed shaft to the feed-rollers, transversely movable with the feed-roller frame, a transverse-feed shaft attached to the feed-roller frame, means for rotating the advance-feed shaft and reciprocating the transverse-feed shaft in unison semiperiodically and alternately.

21. In a machine of the character set forth, the combination with a transversely-movable feed-roller frame, of a pair of feed-rollers carried by the same, an advance-feed shaft, means for rotating the said shaft intermittently, a train of gears, for imparting the motion of the advance-feed shaft to the feed-rollers, transversely movable with the feed-roller frame, a transverse-feed shaft attached to the feed-roller frame, means for reciprocating the said transverse-feed shaft intermittently, and means for adjusting the feed-roller frame transversely.

22. In a machine of the character set forth, the combination with a transversely-movable feed-roller frame, of a pair of feed-rollers carried by the same, an advance-feed shaft, means for rotating the said shaft intermittently and periodically or semiperiodically at will, a train of gears for imparting the motion of the advance-feed shaft to the feed-rollers, transversely movable with the feed-roller frame, a transverse-feed shaft attached to the feed-roller frame, means for reciprocating the said transverse-feed shaft intermittently and periodically or semiperiodically at will, and means for adjusting the feed-roller frame transversely.

23. In a machine of the character set forth, the combination

with a transversely-movable feed-roller frame, of a pair of feed-rollers carried by the same, an advance-feed shaft, means for rotating the said shaft intermittently and adjustable to operate periodically or semiperiodically at will, a train of gears, for imparting the motion of the advance-feed shaft to the feed-rollers, transversely movable with the feed-roller frame, a transverse-feed shaft attached to the feed-roller frame, means for reciprocating the said transverse-feed shaft intermittently and adjustable to operate periodically or semiperiodically at will, each means for operating the two feed-shafts being adjustable one independently of the other, and means for adjusting the feed-roller frame transversely.

24. In a machine of the character set forth, the combination with a transversely-movable feed-roller frame, of a pair of feed-rollers carried by the same, an advance-feed shaft, means for rotating the said shaft intermittently and semiperiodically, a train of gears, for imparting the motion of the advance-feed shaft to the feed-rollers, transversely movable with the feed-roller frame, a transverse-feed shaft attached to the feed-roller frame, means for reciprocating the transverse-feed shaft semiperiodically, the means for operating the advance and transverse feed shafts acting alternately, and means for adjusting the feed-roller frame transversely.

25. In a machine of the character set forth, the combination with a transversely-movable feed-roller frame, of a pair of feed-rollers carried by the same, an advance-feed shaft, a train of gears, for imparting the motion of the advance-feed shaft to the feed-rollers, transversely movable with the feed-roller frame, a transverse-feed shaft attached to the feed-roller frame, means for rotating the advance-feed shaft and for reciprocating the said transverse-feed shaft intermittently and in unison, means for operating the advance-feed shaft independently, and means for adjusting the feed-roller frame transversely.

26. In a machine of the character set forth, the combination with a transversely-movable feed-roller frame, a pair of feed-rollers carried by the same, an advance-feed shaft, a train of gears for imparting the motion of the advance-feed shaft to the feed-rollers, transversely movable with the feed-roller frame, a tranverse-feed shaft attached to the feed-roller frame, means for rotating the advance-feed shaft and reciprocating the said transverse-feed shaft intermittently in unison and periodically or semiperiodically at will, means for operating the advance-feed shaft independently, and means for adjusting the feed-roller frame transversely.

27. In a machine of the character set forth, the combination with a transversely-movable feed-roller frame, of a pair of feed-rollers carried by the same, an advance-feed shaft, a train of gears for imparting the motion of the advance-feed shaft to the feed-rollers, transversely movable with the feed-roller frame, a transverse-feed shaft attached to the feed-roller frame, and means, independently adjustable to operate periodically or semiperiodically at will, for rotating the advance-feed shaft and reciprocating the said transverse-feed shaft intermittently and in unison, means for operating the advance-feed shaft independently, and means for adjusting the feed-roller frame transversely.

28. In a machine of the character set forth, the combination with a transversely-movable feed-roller frame, of a pair of feed-rollers carried by the same, an advance-feed shaft, a train of gears, for imparting the motion of the advance-feed shaft to the feed-rollers, transversely movable with the feed-roller frame, a transverse-feed shaft attached to the feed-roller frame, means for rotating the advance-feed shaft and reciprocating the transverse-feed shaft in unison semiperiodically, and means for adjusting the feed-roller frame transversely.

29. In a machine of the character set forth, the combination of two feed-roller frames spaced a distance apart, a pair of feed-rollers carried by each frame for seizing the side edges of the sheet, and means for adjusting the said feed-roller frames transversely to suit different widths of sheets.

30. In a machine of the character set forth, the combination of two feed-roller frames spaced a distance apart, a pair of feed-rollers carried by each frame for seizing the side edges of the sheet, means for adjusting the said feed-roller frames transversely to suit different widths of sheets, and means for lifting the upper roller of each pair out of contact with the lower roller.

31. In a machine of the character set forth, the combination of a transversely-movable feed-roller frame, two housings carried by the said feed-roller frame, two superposed feed-rollers mounted in said housings, an advance-feed shaft extending through the said feed-roller frame, a gear slidingly mounted on the said advance-feed shaft and located intermediate the said two housings, and a train of gears imparting motion from the said gear on the advance-feed shaft to the feed-rollers, all movable with the said feed-roller frame.

32. In a machine of the character set forth, the combination of a transversely-movable feed-roller frame, two housings carried by the said feed-roller frame, two superposed feed-rollers slidingly mounted in said housings, an advance-feed shaft extending through the said feed-roller frame, a gear slidingly mounted on the said advance-feed shaft and located intermediate the said two housings, a train of gears imparting motion from the said gear on the advance-feed shaft to the feed-rollers, all movable with the said feed-roller frame, and means for lifting the upper feed-roll out of contact with the lower one.

33. In a machine of the character set forth, the combination of a shaft, a crank and a collar mounted fast on the same, a pinion interposed between the two and turning loosely on the shaft, a pin for connecting the collar and pinion, a pivoted latch, for preventing the pin from uniting the pinion and collar, a cam for automatically moving the latch out of the pin semiperiodically, and means for moving the latch out of the pin whereby the collar and pinion are constantly connected, and the crank operates periodically.

34. In a machine of the character set forth, the combination of a reciprocating transverse-feed shaft, a rock-shaft for reciprocating the said transverse-feed shaft, an intermittently-rotatable shaft, connections between the latter and the rock-shaft, and means for operating the rotatable shaft periodically or semiperiodically at will.

35. In a machine of the character set forth, the combination of a reciprocating transverse-feed shaft, a rock-shaft for reciprocating the said transverse-feed shaft, an intermittently-rotatable shaft, connections between the latter and the rock-shaft, and means for operating the rotatable shaft periodically or semiperiodically at will, comprising: a ratchet having two teeth fast on the said shaft, a removable ratchet loose on the said shaft having two teeth, one of which is of a lesser depth than the teeth on the fast ratchet, and a pawl for engaging with the fast and loose ratchet or fast ratchet only.

36. In a machine of the character set forth, the combination of a shaft, a pinion mounted loosely on the said shaft, a ratchet fast on the said shaft, a pawl for imparting the motion of the pinion to the ratchet, a head on one end of the shaft, a cam moving with the pawl a stop-dog normally out of contact with the head, connections between the stop-dog and the cam moving with the pawl for causing the said stop-dog to engage with a notch in the said head after each feeding motion of the shaft.

37. In a machine of the character set forth, the combination of a shaft, a pinion mounted loosely on the said shaft, a ratchet fast on the said shaft, a pawl for imparting the motion of the pinion to the ratchet, a head on one end of the shaft, a cam moving with the pawl, a stop-dog normally in contact with the head, connections between the stop-dog and the cam moving with the pawl for causing the said stop-dog to move out of engagement with the notch in the said head at the beginning of the feeding motion of the shaft, and a check-dog for engaging with the head to prevent the shaft from returning with the ratchet when the latter is on the return stroke.

38. In a machine of the character set forth, the combination with a punching mechanism, an advance-feed mechanism, and a transverse-feed mechanism, of means for operating said feed mechanisms so that the punching mechanism will operate to cut blanks in the same longitudinal row twice in succession.

39. In a machine of the character set forth, the combination with a punching mechanism, an advance-feed mechanism, and a transverse-feed mechanism, of means for operating said feed mechanisms, and means for adjusting the same so that the punching mechanism will operate to cut blanks once or twice in succession in the same longitudinal row.

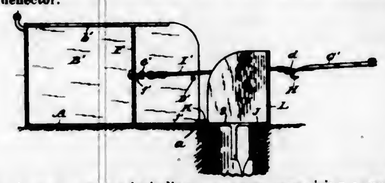
40. In a machine of the character set forth, the combination with a punching mechanism, an advance-feed mechanism, and a transverse-feed mechanism, of means for operating said feed mechanisms, and means for adjusting the same so that the punching mechanism will operate to cut blanks once or several times in succession in the same longitudinal row.

813,050. **SNOW-REMOVING APPARATUS.** HIRAM MAINE, Indianapolis, Ind. Filed Dec. 16, 1905. Serial No. 292,223.

Claim.—1. A snow-remover including a conveyer for gathering and hauling snow and provided with an unloader movable therein.

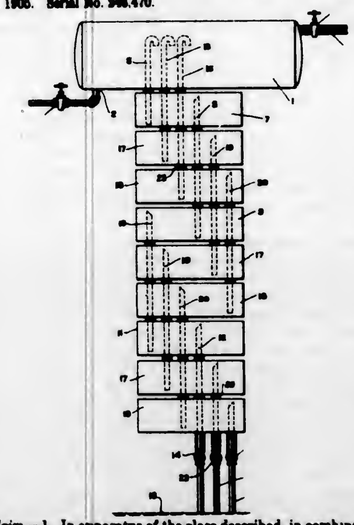
2. A snow-remover including a conveyer for gathering and hauling snow and provided with an unloader movable to draw the snow therefrom, and draft appliances attached to the conveyer-body and to the unloader part thereof.

3. A snow-remover including a sliding conveyer provided with draft appliances, and a guard for manholes of sewers provided with a plurality of guide-bars insertible into a manhole and having an upright deflector.



4. A snow-remover including a conveyer comprising a main part having a bottom, sides provided with guides, a tail end, a handle at the tail end, and draft-lugs at the forward ends of the sides; an unloader comprising a tail-board movable on the bottom of the main part in connection with the guides, and draft appliances having coupling-irons attachable to the draft-lugs and provided with links connected with the tail-board.

813,051. **PUMP.** PATRICK H. LYNCH, New York, N. Y. Filed Feb. 20, 1905. Serial No. 246,470.



Claim.—1. In apparatus of the class described, in combination, a series of receptacles, a connection between each of said receptacles and the receptacle above the same, said connections projecting within and above the lowermost portions of said receptacles, a connecting-pipe between the lowermost receptacle and a source of supply, and means adapted to conduct steam to the uppermost of said receptacles.

2. In apparatus of the class described, in combination, a series of receptacles, pipes connecting each of said receptacles with a lower receptacle and means adapted to produce a vacuum within said receptacles, said pipes projecting within the said receptacles and terminating intermediate the upper and lower walls thereof.

3. In apparatus of the class described, in combination, a series of receptacles, pipes connecting each of said receptacles with a receptacle below the same, each of said pipes projecting within one of said lower receptacles and terminating within the lower portion thereof, a source of supply, a pipe connecting the lowermost receptacle with the source of supply, and means for conducting steam to said receptacles.

4. In apparatus of the class described, in combination, a series of tanks, suction-pipes connecting each of said tanks with a tank below the same in said series and ending intermediate the upper and lower walls of said tanks, and means adapted to cause a substantially simultaneous pumping of said tanks from those next below in the series through said suction-pipes.

5. In apparatus of the class described, in combination, a source of supply, a reservoir, and two series of receptacles interposed between the same, each of said receptacles being connected with one below the same, connections between the uppermost receptacles and said reservoir and connections between the lowermost receptacles and said source of supply, the receptacles of one of said series alternating in position with the receptacles of the other thereof and being adjacent thereto.

6. In apparatus of the class described, in combination, a source of supply, a reservoir, a plurality of series of receptacles interposed between said source of supply and said reservoir, a connection between the uppermost receptacle of each series and said reservoir, a connection between the lowermost receptacle of each series and said source of supply, intermediate connections between said receptacles of each series, and means adapted to reduce the pressure in said receptacles, the receptacles of each series alternating in position with receptacles of all of the other series.

7. In apparatus of the class described, in combination, a source of supply, a reservoir, a plurality of series of receptacles interposed between said source of supply and said reservoir, a connection between the uppermost receptacle of each series and said reservoir, a connection between the lowermost receptacle of each series and said source of supply, intermediate connections between said receptacles of each series, and means adapted to reduce the pressure in said receptacles, the receptacles of each series alternating in position with receptacles of all of the other series and having their walls substantially in contact with the walls of the receptacles adjacent thereto.

8. In apparatus of the class described, in combination, a reservoir, a source of supply, a plurality of series of receptacles interposed between said reservoir and said source of supply, connections between the uppermost receptacle of each series and said reservoir, connections between the lowermost receptacle of each of said series and said source of supply, connections between said receptacles each receptacle of each of said series alternating in position with receptacles of all of the other series and having their walls substantially in contact with the walls of the contiguous receptacles and means adapted to cause each of said receptacles to draw water from that immediately below the same in said series.

9. In apparatus of the class described, in combination, a reservoir, a source of supply, a plurality of series of receptacles interposed between said reservoir and said source of supply, connections between the uppermost receptacles of each of said series and said reservoir, connections between the lowermost receptacles of each of said series and said source of supply, intermediate connections between the receptacles of each of said series, the connection from each of said receptacles to that next below terminating at the lower portion of the lower receptacle, and means for conducting steam to said reservoir, each of said receptacles alternating in position with receptacles of all of the other series and having its walls substantially in contact with the walls of the contiguous receptacles.

10. In apparatus of the class described, in combination, a series of receptacles, pipes connecting each of said receptacles with a receptacle below the same, said first-mentioned pipes projecting within said receptacles and terminating intermediate the upper and lower portions thereof, a source of supply, a pipe connecting the lowermost receptacle with the source of supply, and means for forcing air from said receptacles.

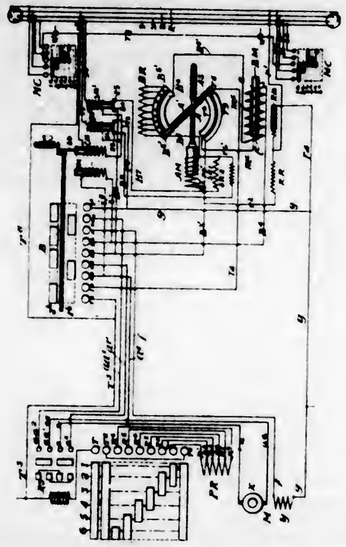
11. In apparatus of the class described, in combination, a series of receptacles, pipes connecting each of said receptacles with a receptacle below the same, said pipes projecting within and terminating intermediate the upper and lower portions thereof, a source of supply, a pipe connecting the lowermost receptacle with the source of supply and means for forcing air from one of said receptacles.

12. In apparatus of the class described, in combination, a reservoir, a source of supply, a plurality of series of receptacles interposed between said reservoir and said source of supply, connections between the uppermost receptacle of each series and said reservoir, connections between the lowermost receptacle of each of said series and said source of supply, and means adapted to force air from said reservoir, each receptacle of each of said series alternating in position with receptacles of all of the other series, and having their walls substantially in contact with the walls of the contiguous receptacles.

813,052. **ELECTRIC BRAKE FOR VEHICLES.** JOSEPH H. MAHONEY, Astoria, N. Y., assignor, by mesne assignments, to American Electric Brake Company, a Corporation of New Jersey. Filed Nov. 8, 1901. Serial No. 81,804.

Claim.—1. The combination with an electric braking system, of an automatically-acting controller mounted on the vehicle and operating to control or vary the braking-current within appropriate limits in relation to the speed of the vehicle to thereby vary the pres-

sure between the braking-surfaces and increase the efficiency of the braking operation.



2. The combination with an electric braking system comprising a brake-magnet having two windings acting to produce pressure between braking-surfaces, of an automatic controller acting to regulate or control the braking-current within appropriate limits relatively to the speed of the vehicle in one of said windings

3. The combination with an electric braking system comprising a brake-magnet having two windings acting to produce pressure between braking-surfaces, of an automatic controller acting to control the braking-current in one of said windings.

4. An electric braking system comprising a brake-magnet having two windings of different resistance both fed from the vehicle-motor running as a generator, an automatically-acting controller regulating the current within appropriate limits relative to the speed of the vehicle in the winding of lower resistance, the circuit of the other winding being of constant resistance and the current therein varying according to the speed of the vehicle.

5. An electric braking system comprising a brake-magnet having two windings of different resistance both fed from the vehicle-motor running as a generator, an automatically-acting controller for controlling the current in the winding of lower resistance, the circuit of the other winding being of constant resistance and the current therein varying according to the speed of the vehicle.

6. In an electric braking system, a brake-winding acting to produce pressure between braking-surfaces and fed through two circuits one of which is of constant resistance, and means for varying the resistance of the other relatively to the speed of the vehicle.

7. An electric braking system comprising opposed braking-surfaces and means for controlling the pressure between them by two currents one of which varies relatively to the speed of the car and the other of which is appropriately controlled, whereby the pressure between the braking-surfaces is varied in relation to the speed of the vehicle and the efficiency of the braking operation increased.

8. In an electric braking system, a brake-operating apparatus comprising two independent circuits of different resistance both fed by the vehicle-motor running as a generator, one of the circuits being of constant resistance and causing a braking action substantially proportional to the speed of the vehicle, and means for automatically varying the resistance of the other circuit within appropriate limits relative to the speed of the car.

9. In an electric braking system, a braking apparatus comprising two independent circuits one of constant resistance which is fed at one time from the main source for propelling the vehicle and at another time from the vehicle-motor running as a generator, and means for varying the current in the other circuit, which is fed from the vehicle-motor, within appropriate limits relatively to the speed of the vehicle.

10. In an electric braking system, a braking apparatus comprising two independent circuits one of constant resistance which is fed at one time from the main source for propelling the vehicle and at another time from the vehicle-motor running as a generator, and means for varying the resistance of the other circuit, which is fed from the vehicle-motor.

11. The combination with an electric braking system, of an electromagnetic automatic controller mounted on the vehicle and operating to control or vary the braking-current within appropriate limits in relation to the speed of the vehicle to thereby vary the pressure between the braking-surfaces whereby increased efficiency of the braking operation is attained and means under the control of the motorman for varying at will the effective current in the winding of the electromagnetic controller.

12. The combination with an electric braking system, of an automatic electromagnetic controller mounted on the vehicle and operating to control resistance in the braking-circuit to thereby vary the pressure between the braking-surfaces in relation to the speed of the vehicle whereby increased efficiency of the braking operation is attained, and means under the control of the motorman for varying the effective current in the winding of the electromagnetic controller.

13. The combination with an electric braking system comprising a brake-magnet having two windings acting to produce pressure between braking-surfaces, of an electromagnetic automatic controller acting to regulate or control the braking-current within appropriate limits relatively to the speed of the vehicle in one of said windings.

14. The combination with an electric braking system comprising a brake-magnet having two windings acting to produce pressure between braking-surfaces, of an electromagnetic automatic controller acting to regulate or control the braking-current within appropriate limits relatively to the speed of the vehicle in one of said windings, and means under the control of the moforman for varying at will the effective current in the winding of the electromagnetic controller.

15. The combination with an electric braking system comprising a brake-magnet having two windings acting to produce pressure between braking-surfaces, of an electromagnetic automatic controller acting to control the braking-current in one of said windings.

16. The combination with an electric braking system comprising a brake-magnet having two windings acting to produce pressure between braking-surfaces, of an electromagnetic automatic controller acting to control the braking-current in one of said windings, and means under the control of the motorman for varying at will the effective current in the winding of the electromagnetic controller.

17. An electric braking system comprising a brake-magnet having two windings of different resistance both fed from the vehicle-motor running as a generator, an electromagnetic automatically-acting controller regulating the current within appropriate limits relative to the speed of the vehicle in the winding of lower resistance, the circuit of the other winding being of constant resistance and the current therein varying according to the speed of the vehicle.

18. An electric braking system comprising a brake-magnet having two windings of different resistance both fed from the vehicle-motor running as a generator, an electromagnetic automatically-acting controller regulating the current within appropriate limits relative to the speed of the vehicle in the winding of lower resistance, the circuit of the other winding being of constant resistance and the current therein varying according to the speed of the vehicle and means under the control of the motorman for varying at will the effective current in the winding of the electromagnetic controller.

19. An electric braking system comprising a brake-magnet having two windings of different resistance both fed from the vehicle-motor running as a generator, an electromagnetic automatically-acting controller for controlling the current in the winding of lower resistance, the circuit of the other winding being of constant resistance and the current therein varying according to the speed of the vehicle and means under the control of the motorman for varying at will the effective current in the winding of the electromagnetic controller.

20. An electric braking system comprising a brake-magnet having two windings of different resistance both fed from the vehicle-motor running as a generator, an electromagnetic automatically-acting controller for controlling the current in the winding of lower resistance, the circuit of the other winding being of constant resistance and the current therein varying according to the speed of the vehicle.

21. The combination with an electric braking system comprising a brake-magnet having two windings acting to produce pressure between braking-surfaces, of an automatic controller acting to regulate or control the braking-current within appropriate limits relatively to the speed of the vehicle in one of said windings and means whereby the motorman may at will control within limits the action of the automatic controller.

22. The combination with an electric braking system comprising a brake-magnet having two windings acting to produce pressure between braking-surfaces, of an automatic controller acting to control the braking-current in one of said windings and means whereby the motorman may at will control within limits the action of the automatic controller.

23. An electric braking system comprising a brake-magnet having two windings of different resistance both fed from the vehicle-motor running as a generator, an automatically-acting controller regulating the current within appropriate limits relative to the speed of the vehicle in the winding of lower resistance, the circuit of the other winding being of constant resistance and the current therein varying according to the speed of the vehicle and means whereby the motorman may at will control within limits the action of the automatic controller.

24. An electric braking system comprising a brake-magnet having two windings of different resistance both fed from the vehicle-motor running as a generator, an automatically-acting controller for controlling the current in the winding of lower resistance, the circuit of the other winding being of constant resistance and the current therein varying according to the speed of the vehicle and means whereby the motorman may at will control within limits the action of the automatic controller.

25. In an electric braking system, a brake-winding acting to produce pressure between braking-surfaces and fed through two circuits one of which is of constant resistance, and means for varying the current in the other circuit, within appropriate limits, relatively to the speed of the vehicle.

26. In an electric braking system, a brake-winding acting to produce pressure between braking-surfaces and fed through two circuits one of which is of constant resistance and an automatic electromagnetic controller for varying the current in the other circuit, within appropriate limits, relatively to the speed of the vehicle.

27. The combination with an electric braking system comprising a brake-winding acting to produce pressure between braking-surfaces and fed through two circuits one of which in the initiation of the braking operation is included in the circuit of the line or main source, the other of which forms part of the motor-circuit running as a generator, and means whereby the first-named circuit may be connected to the motor running as a generator.

28. The combination with an electric braking system comprising a brake-winding acting to produce pressure between braking-surfaces and fed through two circuits one of which in the initiation of the braking operation is included in the circuit of the line or main source, the other of which forms part of the motor-circuit running as a generator and means whereby the first-named circuit may be connected to the motor, running as a generator, and parallel with the other circuit.

29. The combination with an electric braking system comprising a brake-winding acting to produce pressure between braking-surfaces and fed through two circuits of different resistance, means whereby, on the initiation of the braking operation, the circuit of higher resistance is connected with the line or main source, means whereby the circuit of lower resistance is connected with the motor running as a generator and means for connecting the circuit of higher resistance to the motor running as a generator.

30. The combination with an electric braking system comprising a brake-winding acting to produce pressure between braking-surfaces and fed through two circuits of different resistance, means whereby, on the initiation of the braking operation, the circuit of higher resistance is connected with the line or main source, means whereby the circuit of lower resistance is connected with the motor running as a generator, means for connecting the circuit of higher resistance to the motor running as a generator, and means for automatically controlling or varying the current in said circuit of lower resistance within appropriate limits relatively to the speed of the vehicle.

31. The combination with an electric braking system comprising a brake-winding acting to produce pressure between braking-surfaces and fed through two circuits of different resistance, means whereby, on the initiation of the braking operation, the circuit of higher resistance is connected with the line or main source, means whereby the circuit of lower resistance is connected with the motor running as a generator, means for connecting the circuit of higher resistance to the motor running as a generator, and means for varying the resistance of said circuit of lower resistance within appropriate limits relatively to the speed of the vehicle.

32. In an electric braking system for electrically-propelled vehicles, a motor for propelling the vehicle, circuit connections for supplying it with current from a suitable source, an electromagnetic brake apparatus having two windings, one adapted to the line-current and the other to the current developed by the motor when run as a generator, means for cutting off current from said source to the motor and including one of said windings in the circuit of said source, a braking-circuit including the other of said windings and in which the motor, then running as a generator, may be included, and means for removing the first-named winding from the circuit of said source and including it in said braking-circuit.

33. In an electric braking system for electrically-propelled vehicles, a motor for propelling the vehicle, circuit connections for supplying it with current from a suitable source, an electromagnetic brake apparatus having two windings, means for cutting off current from said source to the motor, and including one of said windings in the circuit of said source, a braking-circuit including the other of said windings and in which the motor, then running as a generator, may be included, and means for removing the first-named winding from the circuit of said source, and including it in said braking-circuit in parallel with the other winding.

34. In an electric braking system for electrically-propelled vehicles, a motor for propelling the vehicle, circuit connections for supplying it with current from a suitable source, an electromagnetic brake apparatus having two windings, means for cutting off current from said source to the motor, and including one of said windings in the circuit of said source, a braking-circuit including the other of said windings and in which the motor, then running as a generator, may be included, and an electromagnetic controller included in the braking-circuit and actuated by the current therein to transfer said first-named winding to the braking-circuit and to regulate the braking effect relatively to the speed of the vehicle.

35. In an electric braking system for electrically-propelled vehicles, a motor for propelling the vehicle, circuit connections for supplying it with current from a suitable source, an electromagnetic brake apparatus having two windings, means for cutting off current from said source from the motor, and including one of said windings in the circuit of said source, a braking-circuit including the other of said windings and in which the motor, then running as a generator, may be included, and an electromagnetic controller included in the braking-circuit and actuated by the current therein to transfer said first-named winding to the braking-circuit and to regulate the braking effect relatively to the speed of the vehicle.

36. In an electric braking system for electrically-propelled vehicles, a motor for propelling the vehicle, circuit connections for supplying it with current from a suitable source, an electromagnetic brake apparatus having two windings, means for cutting off current from said source from the motor, and including one of said windings in the circuit of said source, a braking-circuit including the other of said windings and in which the motor, then running as a generator, may be included, and an electromagnetic controller included in the braking-circuit and actuated by the current therein to transfer said first-named winding to the braking-circuit in parallel with the other winding and to regulate the braking effect relatively to the speed of the vehicle.

37. In an electric braking system for electrically-propelled vehicles, a motor for propelling the vehicle, circuit connections for supplying it with current from a suitable source, an electromagnetic brake apparatus having two windings, means for cutting off current from said source from the motor, and including one of said windings in the circuit of said source, a braking-circuit including the other of said windings and in which the motor, then running as a generator, may be included, and an electromagnetic controller included in the braking-circuit and actuated by the current therein to transfer said first-named winding to the braking-circuit in parallel with its own winding and to regulate the braking action relatively to the speed of the vehicle.

38. In an electric braking system, an electromagnetic controller placed in the braking-circuit and actuated by the current therein to automatically control the braking effect relatively to the speed of the vehicle and means for at will regulating the amount of current of the braking-circuit effective in the winding of the electromagnetic controller to thereby regulate the action of the electromagnetic controller.

39. In an electric braking system for electrically-propelled vehicles, the combination of the vehicle-propelling motor, a braking-circuit in which the motor may be connected to run as a generator, and in said circuit an electromagnetic brake-winding, an electromagnetic controller actuated by current in said circuit to automat-

ically regulate the braking action of said winding relatively to the

brake apparatus having two windings, means for cutting off current

ically regulate the braking action of said winding relatively to the speed of the vehicle, and means for at will regulating the amount of current of the braking-circuit effective in the winding of the electromagnetic controller to thereby regulate the action of the electromagnetic controller.

40. In an electric braking system for electrically-propelled vehicles, the combination of the vehicle-propelling motor, a braking-circuit in which the motor may be connected to run as a generator and in said circuit an electromagnetic brake-winding, an electromagnetic controller comprising a variable resistance, a means for including more or less of said resistance in the circuit, and, acting on said means, an electromagnet and a reactionary device acting in opposition to the magnet, whereby the current in the brake-winding is controlled relatively to the speed of the car, and means for at will regulating the amount of current of the braking-circuit effective in the winding of the electromagnetic controller to thereby regulate the action of the electromagnetic controller.

41. In an electric braking system for electrically-propelled vehicles, a motor for propelling the vehicle, circuit connections for supplying it with current from a suitable source, an electromagnetic brake apparatus having two windings, means for cutting off current from said source from the motor, and including one of said windings in the circuit of said source, a braking-circuit including the other of said windings and in which the motor, then running as a generator, may be included, an electromagnetic controller included in the braking-circuit and actuated by the current therein to transfer said first-named winding to the braking-circuit and to regulate the braking action relatively to the speed of the vehicle, and means for at will regulating the amount of current of the braking-circuit effective in the winding of the electromagnetic controller to thereby regulate the action of the electromagnetic controller.

42. In an electric braking system for electrically-propelled vehicles, a motor for propelling the vehicle, circuit connections for supplying it with current from a suitable source, an electromagnetic brake apparatus having two windings, means for cutting off current from said source to the motor, and including one of said windings in the circuit of said source, a braking-circuit including the other of said windings and in which the motor, then running as a generator, may be included, an electromagnetic controller included in the braking-circuit and actuated by the current therein to transfer said first-named winding to the braking-circuit in parallel with the other winding and to regulate the braking action relatively to the speed of the vehicle, and means for at will regulating the amount of current of the braking-circuit effective in the winding of the electromagnetic controller to thereby regulate the action of the electromagnetic controller.

43. In an electric braking system for electrically-propelled vehicles, the combination of the vehicle-propelling motor, means for supplying it with current from a suitable source, a braking-circuit in which the motor may be connected to run as a generator, means for cutting off current to the motor from said source, passing current therefrom through the field of the motor to excite it, an electromagnetic brake apparatus having a winding included in said braking-circuit, and an electromagnetic controller also in said circuit and actuated by the current therein to automatically regulate the braking action of said winding relatively to the speed of the vehicle.

44. In an electric braking system for electrically-propelled vehicles, a motor for propelling the vehicle, circuit connections for supplying it with current from a suitable source, an electromagnetic brake apparatus having two windings, means for cutting off current from said source to the motor, directing current therefrom through the field of the motor, and including one of said windings in the circuit of said source, a braking-circuit including the other of said windings and in which the motor then running as a generator may be included, and means for removing the first-named winding from the circuit of said source and including it in the said braking-circuit.

45. In an electric braking system for electrically-propelled vehicles, a motor for propelling the vehicle, circuit connections for supplying it with current from a suitable source, an electromagnetic brake apparatus having two windings, means for cutting off current from said source to the motor, directing current therefrom through the field of the motor, and including one of said windings in the circuit of said source in series with the motor-field, a braking-circuit including the other of said windings and in which the motor then running as a generator may be included, and means for removing the first-named winding from the circuit of said source and including it in the said braking-circuit.

46. In an electric braking system for electrically-propelled vehicles, a motor for propelling the vehicle, circuit connections for supplying it with current from a suitable source, an electromagnetic brake apparatus having two windings, means for cutting off current from said source to the motor, directing current therefrom through the field of the motor, and including one of said windings in the circuit of said source, a braking-circuit including the other of said windings and in which the motor, then running as a generator, may be included, and means for removing the first-named winding from the circuit of said source and including it in said braking-circuit in parallel with the other winding.

47. In an electric braking system for electrically-propelled vehicles, a motor for propelling the vehicle, circuit connections for supplying it with current from a suitable source, an electromagnetic brake apparatus having two windings, means for cutting off current from said source to the motor, directing current therefrom through the field of the motor, and including one of said windings in the circuit of said source, a braking-circuit including the other of said windings and in which the motor, then running as a generator, may be included, and an electromagnetic controller included in the braking-circuit and actuated by the current therein to transfer said first-named winding to the braking-circuit and to regulate the braking action relatively to the speed of the vehicle.

48. In an electric braking system for electrically-propelled vehicles, a motor for propelling the vehicle, circuit connections for supplying it with current from a suitable source, an electromagnetic brake apparatus having two windings, means for cutting off current from said source to the motor, directing current therefrom through the field of the motor, and including one of said windings in the circuit of said source, a braking-circuit including the other of said windings and in which the motor, then running as a generator, may be included, and an electromagnetic controller included in the braking-circuit and actuated by the current therein to transfer said first-named winding to the braking-circuit in parallel with the other winding and to regulate the braking action relatively to the speed of the vehicle.

49. In an electric braking system for electrically-propelled vehicles, a motor for propelling the vehicle, circuit connections for supplying it with current from a suitable source, an electromagnetic brake apparatus having two windings, means for cutting off current from said source to the motor, directing current therefrom through the field of the motor, and including one of said windings in the circuit of said source, a braking-circuit including the other of said windings and in which the motor, then running as a generator, may be included, an electromagnetic controller included in the braking-circuit and actuated by the current therein to transfer said first-named winding to the braking-circuit and to regulate the braking action relatively to the speed of the vehicle, and means for at will regulating the amount of current of the braking-circuit effective in the winding of the electromagnetic controller to thereby regulate the action of the electromagnetic controller.

50. In an electric braking system for electrically-propelled vehicles, a motor for propelling the vehicle, circuit connections for supplying it with current from a suitable source, an electromagnetic brake apparatus having two windings, means for cutting off current from said source to the motor, directing current therefrom through the field of the motor, and including one of said windings in the circuit of said source, a braking-circuit including the other of said windings and in which the motor, then running as a generator, may be included, and an electromagnetic controller included in the braking-circuit and actuated by the current therein to transfer said first-named winding to the braking-circuit in parallel with the other winding, and to regulate the braking action relatively to the speed of the vehicle.

51. In an electric braking system for electrically-propelled vehicles, the combination of the motor, contacts and circuit connections for supplying it with variable current from a suitable source, a brake-controller on the actuation of which current is cut off from the motor, a master-controller and means interposed between it and the brake-controller for actuating the latter on the movement of the former, a braking-circuit including the motor established on the actuation of the brake-controller, and the winding of an electromagnetic brake apparatus included in the brake-circuit.

52. In an electric braking system for electrically-propelled vehicles, the combination of the motor, contacts and circuit connections for supplying it with variable current from a suitable source, a brake-controller on the actuation of which current is cut off from the motor and directed through its field, a master-controller, and means interposed between it and the brake-controller for actuating the latter on the movement of the former, a braking-circuit including the motor established on the actuation of the brake-controller, the winding of an electromagnetic brake apparatus included in the brake-circuit, and an electromagnetic controller also included in the braking-circuit and actuated by current therein to control the braking action relatively to the speed of the vehicle.

53. In an electric braking system for electrically-propelled vehicles, the combination of the motor, contacts and circuit connections for supplying it with variable current from a suitable source, a brake-controller on the actuation of which current is cut off from the motor and directed through its field, a master-controller, and means interposed between it and the brake-controller for actuating the latter on the movement of the former, a braking-circuit including the motor established on the actuation of the brake-controller, the winding of an electromagnetic brake apparatus included in the brake-circuit, and an electromagnetic controller also included in the braking-circuit and actuated by current therein to control the braking action relatively to the speed of the vehicle.

54. In an electric braking system for electrically-propelled vehicles, the combination of the motor, contacts and circuit connections for supplying it with variable current from a suitable source, a brake-controller on the actuation of which current is cut off from the motor, a master-controller and means interposed between it and the brake-controller for actuating the latter on the movement of the former, a braking-circuit including the motor established on the actuation of the brake-controller, the winding of an electromagnetic brake apparatus included in the brake-circuit, and an electromagnetic controller also included in the braking-circuit and actuated by current therein to control the braking action relatively to the speed of the vehicle.

55. In an electric braking system for electrically-propelled vehicles, the combination of the motor, contacts and circuit-connections for supplying it with variable current from a suitable source, a brake-controller on the actuation of which current is cut off from the motor, a master-controller and means interposed between it and the brake-controller for actuating the latter on the movement of the former, a braking-circuit including the motor established on the actuation of the brake-controller, an electromagnetic brake apparatus having two windings, one of which is then included in the circuit of said source and the other in said braking-circuit, and means for transferring the first-mentioned winding to the braking-circuit.

56. In an electric braking system for electrically-propelled vehicles, the combination of the motor, contacts and circuit connections for supplying it with variable current from a suitable source, a brake-controller on the actuation of which current is cut off from the motor, a master-controller and means interposed between it and the brake-controller for actuating the latter on the movement of the former, a braking-circuit including the motor established on the actuation of the brake-controller, an electromagnetic brake apparatus having two windings, one of which is then included in the circuit of said source and the other in the braking-circuit, and means for transferring the first-mentioned winding to the braking-circuit in parallel with the second-named winding.

57. In an electric braking system for electrically-propelled vehicles, the combination of the motor, contacts and circuit connections for supplying it with variable current from a suitable source, a brake-controller on the actuation of which current is cut off from the motor, a master-controller and means interposed between it and the brake-controller for actuating the latter on the movement of the former, a braking-circuit including the motor established on the actuation of the brake-controller, an electromagnetic brake apparatus having two windings, one of which is then included in the circuit of said source and the other in the braking-circuit, and an electromagnetic braking-current controller included in the braking-circuit and actuated by the current therein to transfer said first-named winding to the braking-circuit and to control the braking action relatively to the speed of the vehicle.

58. In an electric braking system for electrically-propelled vehicles, the combination of the motor, contacts and circuit connections for supplying it with variable current from a suitable source, a brake-controller on the actuation of which current is cut off from the motor, a master-controller and means interposed between it and the brake-controller for actuating the latter on the movement of the former, a braking-circuit including the motor established on the actuation of the brake-controller, an electromagnetic brake apparatus having two windings, one of which is then included in the circuit of said source and the other in the braking-circuit, and an electromagnetic braking-current controller also included in the braking-circuit and actuated by the current therein to transfer said first-named winding to the braking-circuit in parallel with the other winding, and to control the braking action relatively to the speed of the vehicle.

59. In an electric braking system for electrically-propelled vehicles, the combination of the motor, contacts and circuit connections for supplying it with variable current from a suitable source, a brake-controller on the actuation of which current is cut off from the motor, a master-controller and means interposed between it and the brake-controller for actuating the latter on the movement of the former, a braking-circuit including the motor established on the actuation of the brake-controller, the winding of an electromagnetic brake apparatus also included in the brake-circuit, and means for varying the amount of current in the braking-circuit effective in the coil of said electromagnetic controller to vary its control of the braking operation.

60. In an electric braking system for electrically-propelled vehicles, the combination of the motor, contacts and circuit connections for supplying it with variable current from a suitable source, a brake-controller on the actuation of which current is cut off from the motor and current from said source directed through the field of the motor, a master-controller and means interposed between it and the brake-controller for actuating the latter on the movement of the former, a braking-circuit including the motor established on the actuation of the brake-controller, the winding of an electromagnetic brake apparatus also included in the brake-circuit, an electromagnetic controller also included in the braking-circuit and actuated by current therein to control the braking action relatively to the speed of the vehicle, and means for varying the amount of current in the braking-circuit effective in the winding of said electromagnetic controller to vary its control of the braking operation.

61. In an electric braking system for electrically-propelled vehicles, the combination of the motor, contacts and circuit connections for supplying it with variable current from a suitable source, a brake-controller on the actuation of which current is cut off from the motor, a master-controller and means interposed between it and the brake-controller for actuating the latter on the movement of the former, a braking-circuit including the motor established on the actuation of the brake-controller, an electromagnetic brake apparatus having two windings, one of which is then included in the circuit of said source and the other in the braking-circuit, an electromagnetic braking-current controller also included in the braking-circuit and actuated by the current therein to transfer said first-named winding to the braking-circuit and to control the braking action relatively to the speed of the vehicle, and means for varying the amount of current in the braking-circuit effective in the coil of said electromagnetic controller to vary its control of the braking operation.

62. An electric braking system comprising an automatic controller included in a braking-circuit with a motor operating as a generator, a brake-winding m c included in the circuit with the automatic controller and another brake-winding also included in said circuit in shunt to the automatic controller and the coil m c.

63. An electric braking system comprising a braking-circuit, a motor running as a generator therein, an automatic controller in said circuit and two brake-windings one in series with the automatic controller and the other in shunt thereto.

64. An electric braking system comprising a braking-circuit, a motor running as a generator, an automatic controller connected in said circuit, a coarse-wire brake-winding connected in series with the automatic controller and a fine-wire brake-winding adapted to be connected either in the braking-circuit or in circuit with main source of energy.

65. In an electric braking system, the combination of two or more vehicles or units coupled to travel together, a train-cable on each unit for electrically connecting them, a braking-circuit on each unit comprising a source of energy, electromagnetic brake-winding and an automatic controller acting to control the braking action relatively to the speed of the vehicle, and contacts and circuit connections by which the braking operation on each unit may be controlled from a single point on either of them.

66. In an electric braking system, two or more vehicles or units connected to travel together, a train-cable on each unit for electrically controlling a braking system on each unit comprising a braking-circuit containing the vehicle-motor then adapted to run as a generator, a brake-winding and an automatic controller, and a second brake-winding adapted to be connected either in circuit with the line or main source of energy or in said braking-circuit, and contacts and circuit connections for controlling the braking operation on each unit from a single point on either of them.

67. In an electric braking system, the combination of two or more vehicles or units coupled to travel together, a train-cable on each unit for electrically connecting them, and an electromagnetic brake-winding on the several units adapted to be connected in cir-

cuit with the line or source of energy, devices for varying the braking action of said winding, and contacts and circuit connections for initiating the braking operation and varying the braking action from a single point on either unit.

68. In an electric braking system, the combination of two or more vehicles or units coupled to travel together, an electromagnetic braking system on each unit, electromagnetic devices on each unit for throwing its electromagnetic braking system into operation, a train-cable with which said electromagnetic devices are connected and a brake master-controller on each unit connected with the train-cable for operating said electromagnetic devices.

69. In an electric braking system, the combination of two or more vehicles or units coupled to travel together, an electromagnetic braking system on each unit comprising a winding adapted to receive current from the line or main source, electromagnetic devices on each unit for throwing its electromagnetic braking system into operation, a train-cable with which said electromagnetic devices are connected and a brake master-controller on each unit connected with the train-cable for operating said electromagnetic devices.

70. In an electric braking system, the combination of two or more vehicles or units coupled to travel together, an electromagnetic braking system on each unit comprising a winding adapted to the current generated by the motor when running as a generator in the brake-circuit, electromagnetic devices on each unit for throwing its braking system into operation, a train-cable with which said electromagnetic devices are connected and a brake master-controller on each unit connected with the train-cable for operating said electromagnetic devices.

71. In an electric braking system, the combination of two or more vehicles or units coupled to travel together, an electromagnetic braking system on each unit comprising a winding adapted to receive current from the line or main source and a winding adapted to the current generated by the motor when running as a generator in the brake-circuit, electromagnetic devices on each unit for throwing its braking system into operation, a train-cable with which said electromagnetic devices are connected and a brake master-controller on each unit connected with the train-cable for operating said electromagnetic devices.

72. In an electric braking system, the combination of two or more vehicles or units coupled to travel together, an electromagnetic braking system, a brake-controller therefor and a power-controller on each unit, a train-cable electrically connecting the units, a brake master-controller and a power master-controller on each unit connected with the train-cable and on each unit an interlock electromagnet that holds the brake-controller in braking position until the connection from the line or source through the power-controller to the motor is open.

73. In an electric braking system, the combination of two or more vehicles or units coupled to run together, a braking system on each unit comprising a winding adapted to currents from the line or source and a winding adapted to currents from the motor when run as a generator and means on each unit whereby the braking system may be controlled to first include the first-named winding in circuit with the line and then the second-named winding in circuit with the motor running as a generator.

74. In an electric braking system, the combination of two or more vehicles or units coupled to run together, a braking system on each unit comprising a winding adapted to currents from the line or source and a winding adapted to currents from the motor when run as a generator and means on each unit whereby the braking system may be controlled to first include the first-named winding in circuit with the line and then the second-named winding and the first-named winding in circuit with the motor running as a generator.

75. In an electric braking system, the combination of two or more vehicles or units coupled to travel together, an independent braking system on each unit comprising an automatic controller for regulating the braking action relatively to the speed of the unit and means for controlling the respective braking systems of the several units from a single point on either of them.

76. A car-brake having an actuating power-generator driven by momentum of the car and adapted to furnish power diminishing in intensity as the speed of the car diminishes and automatic means for controlling the brake-pressure throughout the period of a braking operation, in relation to the speed of the car, to thereby increase the efficiency of the braking operation.

77. A car-brake having an actuating power-generator driven by momentum of the car and adapted to furnish power diminishing in intensity as the speed of the car diminishes, automatic means for varying the braking-pressure throughout the period of a braking operation, in relation to the speed of the car to thereby increase the efficiency of the braking operation, and means, under the control of the motorman, by which he may, at will, maintain a maximum or some lesser rate of retardation.

78. The combination with a car-brake and a generator adapted to supply power for operating the brake, whose force is greatest when the speed of the car-wheels is greatest, of automatic means for retarding diminution of said power in intensity in relation to the speed of the car throughout the braking operation.

79. A car-brake-actuating mechanism arranged to apply brakes with a pressure which is greatest when the speed of the car-wheels is greatest, and is reduced when such speed is reduced, in combination with means for causing such pressure to decrease in relation to the reduction in speed, but at a less rate.

80. The combination with brake-actuating mechanism, of means for supplying power thereto arranged to supply the greatest pressure when the speed of the car-wheels is greatest, and to diminish the pressure when the speed of the wheels is reduced, and automatic means arranged to cause the brake-pressure to diminish in relation to the reduction in speed but at a less rate.

81. A car-brake, having an actuating power-generator driven by the movement of the car, and adapted thereby to furnish power diminishing in intensity as the speed of the car-wheel diminishes, and automatic means for, throughout the period of a braking operation, retarding the rate of diminution of the brake-pressure, whereby when the wheels cease to rotate some pressure will still be applied upon the brake.

82. An electric braking system comprising the combination of the propelling-motor driven as a generator by momentum of the vehicle, an electromagnetic brake apparatus in the circuit from the generator, and an automatic electromagnetic controller also in the circuit from the generator acting to control the current therein in relation to the speed of the vehicle and negative torque of the generator whereby the pressure of the braking surfaces is varied to thereby increase the efficiency of the braking operation.

83. In an electric braking system, a brake-operating apparatus comprising two independent circuits of different resistance both fed by the vehicle-motor running as a generator, one of the circuits being of constant resistance and causing a braking action substantially proportional to the speed of the vehicle, and means for automatically varying the resistance of the other circuit within appropriate limits relative to the speed of the car and negative torque of the generator.

84. A car-brake having an actuating power-generator driven by momentum of the car and adapted to furnish power diminishing in intensity as the speed of the car diminishes and automatic means for controlling the brake-pressure in relation to the speed of the car and the negative torque of the generator whereby the efficiency of the braking operation is increased.

85. An electric braking system comprising a motor driven as a generator by momentum of the vehicle, an electromagnetic brake apparatus having two circuits, an automatically-acting electromagnetic controller included in one of said circuits and acting to vary the current therein in relation to the speed of the vehicle and negative torque of the generator.

86. An electric braking system comprising a motor driven as a generator by momentum of the vehicle, an electromagnetic brake apparatus having two circuits one of which is of constant and the other of variable resistance and an automatically-acting electromagnetic controller in the latter circuit acting to vary the current therein in relation to the speed of the vehicle and negative torque of the generator.

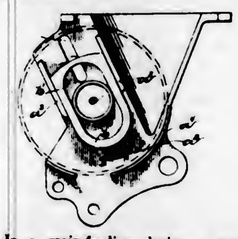
818,058. SHOE. JOHN G. MARCHAND, Buffalo, N. Y. Filed July 1, 1905. Serial No. 267,890.

Claim.—1. In a shoe, the combination of an insole, a cushion arranged on the insole, a metallic strip arranged lengthwise of the edges of the insole and cushion and across the joint between the same, and a covering extending over said insole, cushion and strip, substantially as set forth.

2. In a shoe, the combination of an insole, a cushion arranged on the insole, a metallic strip arranged lengthwise of the edges of the insole and cushion and across the joint between the same, and a covering extending over said insole, cushion and strip, and having perforations above said strip, substantially as set forth.

3. In a shoe, the combination of an insole, a cushion arranged on the insole, strips of copper and zinc arranged along opposite edges of the insole and cushion across the joint between the same and overlapping each other at two of their respective ends while their opposite ends are out of contact with each other, and a covering extending over said insole, cushion and strips and having perforations above the strips substantially as set forth.

818,054. ADJUSTABLE FEED FOR GRAIN-DRILLS. ADELBERT F. MILLS, Shortsville, N. Y., assignor to American Seeding Machine Company, Jersey City, N. J., a Corporation of New Jersey. Filed Aug. 19, 1905. Serial No. 274,230.



Claim.—1. In a grain-feeding device, a grain-cup having straight converging sides, a distributer-wheel, a cut-off device, the working edge of which is parallel with the inner face of the flange of the distributer-wheel, and the contour of which is such as to form in combination with said flange a gradually-contracting measuring-channel, and means connected to said cut-off device above the driving-shaft of the distributer-wheel for moving said device to vary the area of the measuring-channel, substantially as specified.

2. In a grain-feeding device, a distributer-wheel, a grain-cup having straight converging sides, a sliding member within the periphery of the distributer-wheel and operated from above the axis thereof, forming with the flange of said distributer-wheel a rhomboidal-shaped measuring-channel parallel guides for said sliding member arranged at an inclination to the vertical, and means for moving said sliding member to vary the size of said measuring-channel while maintaining the rhomboidal form of said channel, substantially as specified.

3. In a grain-feeding device, a grain-cup having straight converging sides, a recessed distributer-wheel, a discharge-conduit leading from said grain-cup, a sliding member forming an adjustable wall of said conduit, parallel guides for said sliding member arranged at an inclination to the vertical, a rock-shaft, a connection from said rock-shaft to said movable member at a point above the axis of the distributer-wheel, whereby the area of the discharge-conduit may be regulated by the oscillation of said rock-shaft, substantially as specified.

4. In a grain-feeding device, a grain-cup, a recessed distributer-wheel, an adjustable gate forming with the flange of said distributer-wheel a measuring-channel, means for moving said adjustable gate, and a connection between said actuating means and said gate at a point above the axis of the distributer-wheel, substantially as and for the purpose specified.

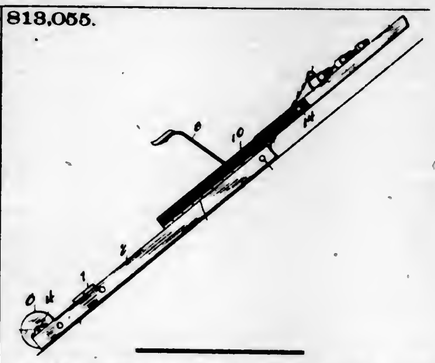
818,055. ROAD-GRADER. CHRISTIAN MORKING, Plummer, Minn. Filed May 13, 1905. Serial No. 260,260.

Claim.—1. A road-grader, including scraping members having shoes, and a roller secured at the rear ends of the scraping members.

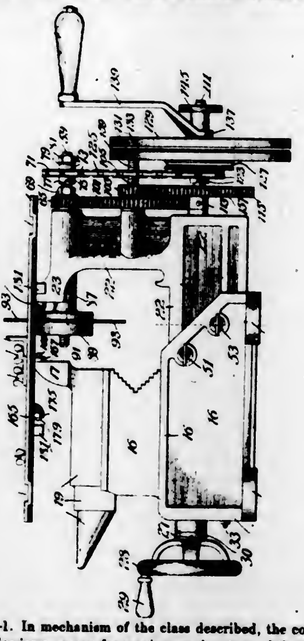
2. A road-grader comprising scraping members converging rearwardly, and a roller mounted between the convergent end thereof.

3. A road-grader, comprising scraping members converging rearwardly toward each other, a shaft mounted in the rear ends of the scraping members, a roller mounted upon the shaft, metallic rods crossing each other and connected at their opposite ends to the scraping members to brace the latter, other braces associated with the scraping members, a tongue pivoted to said other braces, a flexible connection between the tongue and scraping members, and a seat upon the body of the scraper.

818,055.



818,056. COMBINATION MACHINE-TOOL. JAMES W. MYERS, Chicago, Ill., assignor to The Myers Manufacturing Company, Chicago, Ill., a Corporation of Illinois. Filed Jan. 30, 1905. Serial No. 243,340.



Claim.—1. In mechanism of the class described, the combination of two vise-jaws, means for moving one jaw toward the other, a rotatable working spindle mounted adjacent to one of said jaws, a saw or other cutting disk mounted on said spindle between the jaws of the vise, means for rotating said spindle, and a table above the vise adapted to be supported thereby there being an opening in the table through which said cutting saw or disk passes to reach work upon the table.

2. In mechanism of the class described, the combination of two vise-jaws, means for moving one jaw toward the other, a rotatable shaft or spindle mounted in one of said jaws, a tool-arbor mounted upon said spindle between said open jaws, means for rotating said shaft or spindle and a reversible table detachably mounted between the jaws of the vise and above the vise, there being two slots in said table, one for a broad disk, the other for a narrow disk, and lugs upon the under side of the table adapted to be clamped between the jaws of the vise, said lugs being so located with reference to the slots in the table that by turning the table end for end in the vise it may be used in connection with either a broad disk or a narrow disk mounted in the said tool-arbor upon said spindle, substantially as described, for the purpose set forth.

3. In mechanism of the class described, the combination of two it with a loosely-running fly-wheel on the second shaft whereby

2. In a bin-bottom, the combination with the bin of flexible sup- *Claim.*—1. A lifter for hollow articles, comprising an elongated

3. In mechanism of the class described, the combination of two vise-jaws, one stationary and the other adapted to be moved horizontally with reference thereto, means for moving the second jaw with reference to the first, a working table having lugs thereon adapted to be clamped between the jaws of the vise, supplemental lugs adapted to accurately position said first lugs with reference to the vise-jaws and mechanism in the operating connection between said jaws for adjusting said movable jaw at right angles to its line of motion with reference to the fixed jaw, whereby said movable jaw is adjusted with reference to the fixed jaw and the table, substantially as described.

4. In mechanism of the class described, the combination of two vise-jaws, means for moving one jaw toward the other, a rotatable spindle mounted in one of said jaws having a portion projecting between said jaws, means for rotating said spindle, a table above the vise having lugs on the under side thereof adapted to be detachably clamped between the jaws of the vise, lugs 181 upon the under side of the table, and lugs 149 extending horizontally from the first-mentioned lugs adapted to engage corresponding openings in the faces of the vise-jaws for insuring the same positioning of the parts, there being an opening in said table through which the grinding-wheel or saw upon the spindle passes to reach work upon the table.

5. In mechanism of the class described, the combination of two vise-jaws, means for moving one jaw toward the other, a rotatable shaft or spindle mounted in one of said jaws, means for rotating said spindle, a tool-arbor on said spindle between the jaws of the vise, and a reversible table above the vise having lugs on the under side thereof adapted to be detachably clamped between the jaws of the vise, guiding means on the table, lugs and vise for insuring the same positioning of the parts, there being two openings in said table through which a narrow saw or a wide wheel mounted in the same position in the tool-arbor on the working spindle are respectively adapted to pass to reach work upon the table when the table is turned end for end and clamped in the jaws of the vise.

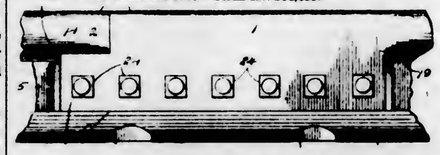
6. In mechanism of the class described, the combination of a stationary jaw-frame carrying a stationary vise-jaw and having a recess therein extending along the base in the direction of the jaw, a movable jaw having a frame on which there is a right-angled extension extending into said recess in the stationary jaw-frame, means for moving said movable jaw-frame extension backward and forward inside said recess in the stationary frame, set-screws on opposite sides of the stationary frame engaging the sides of the extension of the movable frame within the stationary frame, whereby by changing the positions of said set-screws the movable frame may be adjusted laterally within the stationary frame, thereby ultimately adjusting the movable jaw of the vise with reference to the stationary jaw, and a working table having lugs thereon adapted to be clamped between the jaws of the vise and supplemental lugs upon said first lugs adapted to accurately position them with reference to the vise-jaws when the movable jaw is adjusted laterally as described.

7. In mechanism of the class described, the combination of a stationary jaw-frame carrying a stationary vise-jaw and having a recess therein extending along the base in the direction of the jaw, a movable jaw having a frame on which there is a right-angled extension extending into said recess in the stationary jaw-frame, means for moving said movable jaw-frame extension backward and forward inside said recess in the stationary frame, set-screws on opposite sides of the stationary frame engaging the sides of the extension of the movable frame within the stationary frame, whereby, by changing the positions of said set-screws the movable frame may be adjusted laterally within the stationary frame, thereby ultimately adjusting the movable jaw of the vise with reference to the stationary jaw, horizontal ridges extending along the movable frame adjacent to said set-screws adapted to assist in causing the movable frame to move in a straight line with reference to the stationary frame, and a working table having lugs thereon adapted to be clamped between the jaws of the vise and supplemental lugs upon said first lugs adapted to accurately position them with reference to the vise-jaws when the movable jaw is adjusted laterally as described.

8. In mechanism of the class described, in combination with a suitable support and a work-table secured thereto, there being an opening in the table through which a rotating saw or other disk is adapted to pass to reach work from the table; a shaft journaled in said support, a saw or disk attached to said shaft in such a position that a portion of it passes through said opening in the table, another shaft mounted in the support below said first shaft and table gearing adapted to communicate power from said second shaft to said first shaft, other power-transmitting means on said first shaft connecting it with a loosely-running fly-wheel on the second shaft whereby power is communicated from said first shaft to the fly-wheel, and means for rotating said second shaft.

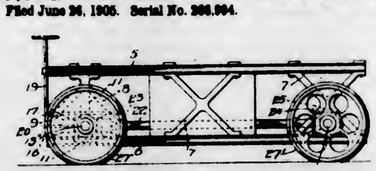
9. In mechanism of the class described, the combination with a suitable support, a working table above it, there being a slot in the table through which a saw or other cutting-disk is adapted to pass; a shaft journaled in the support adjacent to the table, a saw or cutting-disk secured to said shaft extending through said slot in the table, a pinion rigidly secured to the other end of said shaft, a sprocket-wheel also rigidly secured to the same end of said shaft, an intermediate shaft mounted in the support below said first shaft, a gear mounted on said intermediate shaft, said gear meshing with the pinion on the first shaft, a pinion on the intermediate shaft, a third or driving shaft journaled in the frame at a distance from said first two shafts, a gear rigidly secured to said driving-shaft meshing with the pinion on the intermediate shaft, a fly-wheel loosely journaled upon said driving-shaft, a sprocket-wheel secured to said fly-wheel, also loosely journaled upon said driving-shaft in line with the first sprocket-wheels above mentioned, a sprocket-chain over said sprocket-wheel and a crank-handle detachably secured to said driving-shaft outside the driving-wheel, whereby rotating the crank-handle communicates power to the driving-shaft, to the intermediate shaft, to the first-mentioned shaft and saw or operating-tool, thence back through said sprocket-wheel and chain to the idle running fly-wheel, substantially as described.

813,057. **RAILROAD-JOINT.** GEORGE M. MCCLURE, Sterling, Kans. Filed June 10, 1905. Serial No. 264,630.



Claim.—A rail-joint comprising abutting rail-sections each including a tread, a web and a flange, the sections being halved and having their halved portions lapping, the web of each halved portion being extended laterally to the width of the tread at its opposite side from the cut-away portion excepting at its extreme end where it is further cut away, said other cut-away portion having the tread omitted and being engaged beneath the tread of the opposite section, and securing means engaged through the overlapped portions of the rail-sections.

813,058. **AUTOMOBILE.** WILLIAM T. PENROSE, Spokane, Wash. Filed June 26, 1905. Serial No. 266,994.

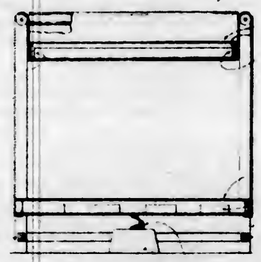


Claim.—In a vehicle, the combination with upper and lower horizontally-disposed frames, of depending brackets carried by the upper frame, longitudinally-extending arcuate plates carried by the brackets, longitudinally-extending arcuate plates carried by the lower frame in vertical alinement with the first-named plates and spaced therefrom, a plate carried by the lower frame, a vertical shaft pivotally mounted upon the plate and in the upper frame, a live axle journaled horizontally in the vertical shaft and extending between the spaced plates, rollers carried by the axle and engaging the plates, wheels carried by the axle, a bevel-gear journaled upon the vertical shaft, a bevel-gear carried by the axle and meshing with the first-named bevel-gear, and means for driving the first-named bevel-gear.

813,059. **BIN.** HUMPHREY M. PRAED, Riverside, Cal.; W. B. Pedley administrator of said Humphrey M. Praed, deceased. Filed Sept. 12, 1904. Serial No. 224,857.

Claim.—1. A bin having a yieldingly-supported bottom and counterbalancing means connected to said bottom to allow the same to yield in proportion to the weight resting thereon.

2. In a bin-bottom, the combination with the bin of flexible supports for said bottom and counterbalancing means connected to said flexible supports.



3. In a bin, the combination with the bin-bottom of flexible members forming the sides of the bin and supporting the bottom, and rollers supporting said flexible members.

4. In a bin, the combination of a frame carrying rollers, flexible strip members forming the sides of the bin, and passing over said rollers, a bin-bottom connected to the one end of said strips and counterbalancing means connected to the other end of said strips.

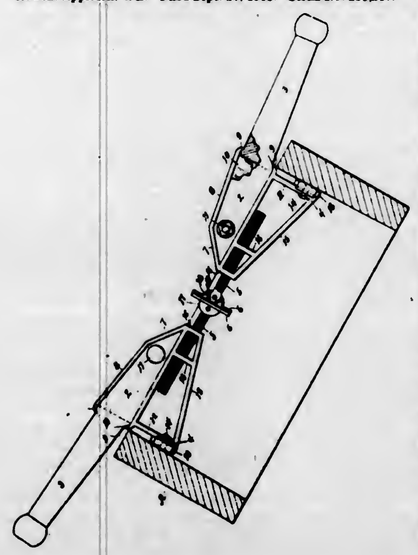
5. A bin having a yieldingly-supported bottom and a plurality of counterbalancing means brought successively in connection with the bottom to increase the supporting effect thereon as the bottom is lowered.

6. A frame, rollers journaled thereon, flexible strips passing over said rollers and forming the sides of said bin, a bin-bottom connected to one end of each strip and a counterbalancing-frame extending under the bin-bottom and connected to the other end of each strip.

7. A frame, rollers journaled thereon, flexible strips passing over said rollers and forming the sides of said bin, a bin-bottom connected to one end of each strip, a counterbalancing-frame extending under the bin-bottom and connected to the other end of each strip, and a supplementary weight suspended from the counterbalancing-frame.

8. A bin having flexible sides and bottom, and comprising a bottom frame over which the flexible bottom is stretched said bottom frame having chamfered upper edges.

813,060. **LIFTER FOR LIFTING HOLLOW BLOCKS.** GUILFORD D. ROWELL, Appleton, Wis., assignor of one-half to Dudley G. Rowell, Appleton, Wis. Filed Sept. 27, 1905. Serial No. 280,367.



Claim.—1. A lifter for hollow articles, comprising an elongated and laterally-expanded body with a handle extending therefrom in the direction of its length and with a shoulder at its rear end presenting a bearing rearwardly, and a head mounted on the body adjustable in the direction of its length toward and from the plane of bearing of the shoulder.

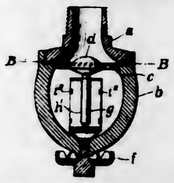
2. A lifter for hollow blocks, comprising a body, a handle projecting from the body at its rear end in the direction of its length, a laterally-extending shoulder on the body near its rear end, a head mounted on a screw-threaded neck adjustable by its thread in the body from and toward the shoulder.

3. In a lifter for hollow blocks, a wood handle, a metal-frame body fitted on and secured to the wood handle and having a laterally-projecting shoulder and screw-bearings for a neck, a screw-threaded neck turning into the bearings in the frame, and a head mounted tiltably on the front end of the screw.

4. In combination with the body of a lifter having a shoulder, a screw-threaded neck adjustable endwise in the front end of the body, a plate-head fitted on the front end of the neck rotatable with the neck, and means on the neck and head preventing more than limited oscillation of the head on the neck.

5. As a part of a lifter for hollow articles, a metal frame comprising a generally U-shaped marginal elongated bar, a medial and connecting web, a laterally-projecting shoulder, a leg connecting the outer end of the shoulder and the distant front end of the U-shaped bar, a screw-threaded neck turning into the frame, and a head on the front end of the neck.

813,061. **AUTOMATIC SPRINKLER.** ELVIDO V. SMITH, Philadelphia, Pa. Filed May 19, 1905. Serial No. 261,127.



Claim.—1. A fusible valve-supporting strut for automatic sprinklers, consisting of a vertically-slotted member the lower end of which constitutes one strut end, and a post supported at one of its ends only in the inner end of the slot of the other member and the upper free end forming the other strut end, said post being unsupported by the slotted member adjacent to its strut end, and said parts being fusibly united, whereby on the fusing of the connection the movement of said slotted member will lower the point of support between the inner end of its slot and the post, and result in allowing the post to drop.

2. A fusible valve-supporting strut for automatic sprinklers, consisting of a vertically-slotted member the lower end of which constitutes one strut end, and a post supported at one of its ends only in the inner end of the slot of the other member, and the other free end being unsupported and forming the other strut end of the device, and an outer shield-plate located over the face of said slotted member and the body of the post, said shield and slotted member being fusibly united together at their adjacent faces.

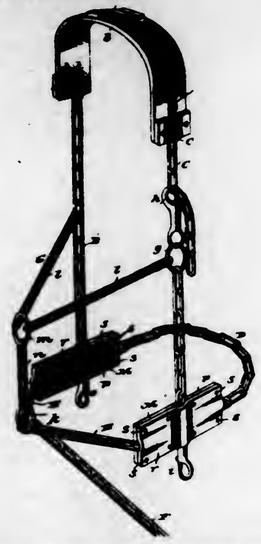
3. A fusible valve-supporting strut for automatic sprinklers, consisting of a vertically-slotted member the lower end of which constitutes one strut end, and a post supported at one of its ends only in the inner end of the slot of the other member, and the other free end being unsupported and forming the other strut end of the device, and outer shield-plates arranged over the faces of the slotted member and post and fusibly united to them.

4. A fusible valve-supporting strut for automatic sprinklers, consisting of the longitudinally-slotted plate *h*, the post *g* positively supported at one end only in the inner end of said slot the other end constituting one strut end and being unsupported, and the shield-plates *i* and *j* arranged one on each face of the plate *h* and covering the body of the post *g*, said plates *h*, *i*, *j* being fusibly united together and to the post *g* at their adjacent faces.

5. A fusible valve-supporting strut for automatic sprinklers, consisting of the longitudinally-slotted plate *h* having the hooked portion h^5 at the upper end of the slot, the post *g* positively supported at one end only at the inner end of said slot, the other end constituting one strut end and being unsupported by said slotted member, and the shield-plate *j* arranged over one face of the plate *h* and post

g and having its upper edge engaged by the hooked portion h^3, said plates being fixibly united together and to the post *g*.

813,062. HALTER. MILES M. STOKES, Nashville, Tenn. Filed Sept. 7, 1905. Serial No. 277,665.



Claim.—1. A halter comprising a headstall of chain, a cheek-piece of chain depending from the headstall and terminating at its lower end in a snap-hook permanently connected thereto, a second cheek-piece depending from the headstall and having a lower portion of chain terminating at its lower end in a snap-hook permanently connected thereto and also having an upper portion of chain and a snap-hook permanently connected to one of said portions and engaged with the other, jaw-pieces of chain permanently connected to the cheek-pieces, a throat-latch of chain permanently connected to the cheek-pieces and jaw-pieces, a nose-piece of chain permanently connected to the cheek-pieces, a pad of leather arranged at the inner side of the chain headstall, loops riveted to said pad and extending over the headstall, and pads having inner layers of leather arranged at the inner sides of the cheek, nose and jaw pieces at the points of intersection thereof and also having outer layers of leather arranged at the outer sides of said pieces and riveted to the inner layers.

2. In a halter, the combination of cheek-pieces, a nose-piece and jaw-pieces; said pieces being formed of chain and being permanently connected together, and pads having inner layers of leather arranged at the inner sides of the cheek, nose and jaw pieces at the points of intersection thereof and also having outer layers of leather arranged at the outer sides of said pieces and riveted to the inner layers.

813,068. PROCESS OF SEPARATING SUBSTANCES OF DIFFERENT DIELECTRIC CAPACITIES. HENRY M. SUTTON, WALTER L. STEELE, and ERWIN G. STEELE, Dallas, Tex. Filed Apr. 13, 1903. Serial No. 152,393.

Claim.—1. In a process of separating the particles of a mass or the components of a mixture, developing in said particles or components dielectric hysteretic impedance, and separately collecting the particles.

2. In a process of separation, subjecting a mass or mixture to the action of a varied static charge to establish dielectric hysteretic impedance, and separately collecting the components.

3. In a process of separation, subjecting material to be separated to the action of alternating and varied electrostatic charges to establish dielectric hysteretic impedance, and separately collecting the separated components of the material.

4. In a process of separation, subjecting material to alternating electrostatic charges of unequal periodicity to establish dielectric hysteretic impedance, and separately collecting the separated components.

5. In a process of separation, subjecting material to the action of electrostatic charges in periods adapted in rapidity to establish dielectric hysteretic impedance in any particular material being separated, and separately collecting the separated components.

6. In a process of separation, subjecting material to the action of electrostatic charges varied in periods, potential and in polarity in accordance with the preference of the material being separated to establish dielectric hysteretic impedance, and separately collecting the separated components.

7. In a process of separation, subjecting material to the action of alternating electrostatic charges varied in potential to establish dielectric hysteretic impedance, and separately collecting the separated components.

8. In a process of separation, subjecting material to the action of electrostatic charges varied in the potential of their opposite signs to establish dielectric hysteretic impedance, and separately collecting the separated components.

9. In a process of separation, subjecting material to the action of electrostatic charges varying in the duration of their opposite signs to establish dielectric hysteretic impedance, and separately collecting the separated components.

10. In a process of separation, subjecting material to the action of electrostatic charges varying in the duration and potential of their opposite signs to establish dielectric hysteretic impedance, and separately collecting the separated components.

11. In a process of separation, subjecting particles of a mass or components of a mixture to the action of an alternating electrostatic charge to establish dielectric hysteretic impedance, and separately collecting the separated components.

12. In a process of separating particles of a mass or components of a mixture, developing in said particles or components dielectric hysteretic impedance and simultaneously exposing them to the inductive action of a polarized terminal, and separately collecting the separated particles or components.

13. In a process of separation, passing material through a field having at one point an alternating static charge and at an opposite point a constant static charge to establish dielectric hysteretic impedance, and separately collecting the separated components.

14. The process of separation which consists in subjecting material to the action of an alternating varied electric field of force capable of maintaining a difference of potential between the particles of the mass and a supporting device for said material to establish dielectric hysteretic impedance, and separately collecting the separated components.

15. The process of separation which consists in subjecting material to an electrostatic field of alternating and of variable intensity to establish dielectric hysteretic impedance, removing from the said field by an auxiliary force such particles as are electrified, and separately collecting the separated components.

16. The process of separation which consists in constantly charging a mass or mixture to be separated with a varied and alternating potential to establish dielectric hysteretic impedance, feeding the mass into a dielectric medium and removing therefrom such particles as differ in their electrical relation thereto, and separately collecting the separated components.

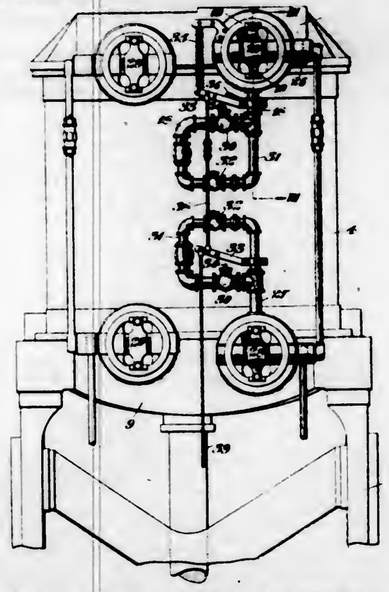
17. The process of separating particles of a mass or components of a mixture which consists in charging the same with an electrostatic current of varied potential to establish dielectric hysteretic impedance, simultaneously exposing the same to the inductive action of a polarized terminal, and collecting separately the particles which are sufficiently responsive.

18. In a process of separating the particles of a mass or the components of a mixture producing therein a lag of charge on said particles or components, and separately collecting the separated particles or components.

19. The process of subjecting the particles of a mass or the components of a mixture to the action of an electrostatic current of varying potential so as to cause and maintain a difference of potential between the particles, simultaneously exposing the same to the inductive action of a polarized terminal, and separately collecting the particles that are sufficiently responsive.

20. In a process of separation, subjecting a mass or mixture to the action of a varied static charge regulated to effect a separation by its action upon the dielectric capacity of the particles and separately collecting the components.

813,064. CONTROLLING MECHANISM FOR BLOWING-ENGINES. JOHNSON V. STEVENS, Johnstown, Pa. Filed May 16, 1905. Serial No. 260,996.



Claim.—1. A blowing-engine having an air-cylinder, a valve therefor, and means, actuated by the retrograde movement of the engine for preventing the opening of said valve.

2. In a blowing-engine, the combination with the air-cylinder, of an outlet-valve therefor, actuating means for said valve and means operated by the engine for rendering said actuating means inoperative upon the retrograde movement of the engine.

3. In a blowing-engine, the combination with the air-cylinder, of an outlet-valve therefor, actuating means for said valve adapted to be operated by air-pressure and means for cutting off the supply of air from said actuating means when the engine is driven in a reverse direction to that of its normal movement.

4. In a blowing-engine, the combination with the air-cylinder, of outlet-valves therefor, actuating means for said valves adapted to be operated by air-pressure from the cylinder, and means for cutting off the supply of air for said actuating means when the engine is driven in a reverse direction to that of its normal movement.

5. In a blowing-engine, the combination with the air-cylinder, of an outlet-valve therefor, an actuating-cylinder for said valve, a passage-way connecting said actuating-cylinder with the air-cylinder, a controlling-valve in said passage-way and means for closing said controlling-valve when the engine is driven backward.

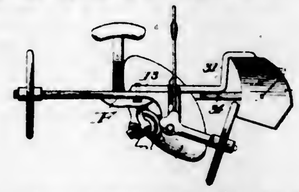
6. In a blowing-engine, the combination with the air-cylinder and the main shaft, of an outlet-valve for the air-cylinder, an actuating-cylinder for said valve, a controlling-valve for said actuating-cylinder and means connected with the main shaft adapted to close said controlling-valve when the engine is driven backward.

7. In a blowing-engine, the combination with the air-cylinder and the main shaft of an outlet-valve for the air-cylinder, an actuating-cylinder for said valve, a controlling-valve for said actuating-cylinder, a clutch on the main shaft and means connected with said clutch to close said controlling-valve when the engine is driven backward.

8. In a blowing-engine, the combination with the air-cylinder and the main shaft, of an outlet-valve for the air-cylinder, an actuating-cylinder for said valve, a controlling-valve for said actuating-cylinder, a ratchet-clutch on the main shaft operative only when the engine is run backward, a rocker-arm connected with said clutch and with said controlling-valve and a friction-clutch interposed between said rocker-arm and said ratchet-clutch.

9. In a blowing-engine, the combination with the air-cylinder and the main shaft, of an outlet-valve for the air-cylinder, an actuating-cylinder for said valve, a passage-way connecting said actuating-cylinder with the air-cylinder, a controlling-valve in said passage-way, a by-pass for said controlling-valve, a check-valve in said by-pass, a lever for closing said controlling-valve; a ratchet-clutch on the main shaft operative only when the engine is run backward, a rock-shaft connected with said clutch, a rocker-arm on said rock-shaft, a friction-clutch interposed between said rocker-arm and said rock-shaft, a connection between said rocker-arm and said lever and means for returning said lever and its operating mechanism to their normal position when inoperative.

813,065. SOD-TURNER FOR DISK PLOWS. JOHN J. TRAVIS, Cascade, Mont. Filed May 10, 1905. Serial No. 259,687.



Claim.—In a plow of the character described, the combination with the framework, the disk, and the bearing therefor; of a sod-turner consisting of a curved plate, and a plurality of brackets secured at one end to the outer side of said plate and at the other end to the framework to hold the plate in position, as and for the purpose set forth.

813,066. AIR AND LIQUID COOLING APPARATUS. GARDNER T. VOORHEES, Boston, Mass. Filed June 5, 1903. Serial No. 160,153.

Claim.—1. A tier of horizontal liquid-channels formed of boards, and angle-irons which support the boards; the angle-irons extending the entire length of the liquid-channels in two tiers, the vertical legs of the angle-irons forming sides for the liquid-channels, while the horizontal legs form supports for the ends of the boards; upright supports for the angle-irons; a liquid-inlet to the upper liquid-channel and a liquid-outlet from the lower liquid-channel; liquid-outlets for the intermediate liquid-channels; a casing inclosing the liquid-channels, the two sides of the said casing being at a distance from the liquid-channels; an air-inlet to, and an air-outlet from, the casing; air-channels being thus formed by the liquid-channels and these two sides of the casing; all being so combined that liquid flowing through the liquid-channels will exchange heat with the air flowing through the air-channels.

2. A tier of horizontal liquid-channels formed of boards, whose edges abut, and angle-irons which support the boards; the angle-irons extending the entire length of the liquid-channels in two tiers, the vertical legs of the angle-irons forming sides for the liquid-channels, while the horizontal legs form supports for the ends of the boards; upright supports for the angle-irons; a liquid-inlet to the upper liquid-channel, and a liquid-outlet from the lower liquid-channel; dams at the ends of the liquid-channels; liquid-outlets for the intermediate liquid-channels; a casing inclosing the liquid-channels, the two sides of said casing being at a distance from the liquid-channels; an air-inlet to, and an air-outlet from, the casing;

air-channels being thus formed by the liquid-channels and these two sides of the casing; all being so combined that the liquid flowing

carried by the door members and in engagement therewith and serving to prevent the passage of air-currents.

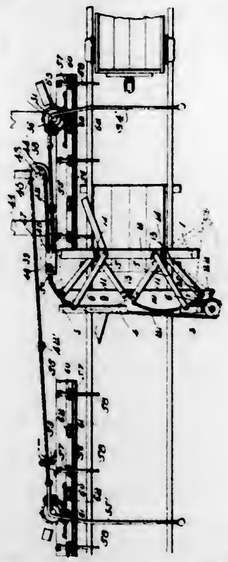
Claim.—1. The combination with the jaw-clamping sleeve of a

3. A machine for cutting or shearing metal sheets or plates,

air-channels being thus formed by the liquid-channels and these two sides of the casing; all being so combined that the liquid flowing through the liquid-channels will exchange heat with the air flowing through the air-channels.

3. A tier of horizontal liquid-channels formed of boards, whose edges abut, and angle-irons which support the boards; the angle-irons extending the entire length of the liquid-channels in two tiers, the vertical legs of the angle-irons forming sides for the liquid-channels, while the horizontal legs form supports for the ends of the boards; upright supports for the angle-irons; a liquid-inlet to the upper liquid-channel, and a liquid-outlet from the lower liquid-channel; dams at the ends of the liquid-channels; liquid-outlets for the intermediate liquid-channels; a casing inclosing the liquid-channels, the two sides of said casing being at a distance from the liquid-channels; an air-inlet to, and an air-outlet from, the casing; air-channels being thus formed by the liquid-channels, and these two sides of the casing; dampers in the air-channels so arranged that air may be caused to flow through the air-channels either in series or in parallel; all being so combined that the liquid flowing through the liquid-channels will exchange heat with the air flowing through the air-channels.

813,067. **MINE-SHAFT DOOR.** ISAAC WHITNEY, Oskaloosa, Iowa; Henry D. Lane administrator of said Isaac Whitney, deceased. Filed June 30, 1904. Serial No. 214,527.



Claim.—1. The combination with a door, of a plurality of door-operating devices extending across a pathway or road leading to the door, and in a position to be successively engaged by an animal or object traveling over the track, each of said door-operating devices serving when operated to effect the complete opening movement of the door, and all acting as they are successively engaged to retain the door in full-open position.

2. The combination with a door, of a door-operating lever extending across a pathway or road leading to the door and being in a position to be engaged by an animal, and a plurality of levers also connected to the door and projecting partly across the roadway in position to be successively engaged by a car or other object following the animal.

3. In mine-doors, a pair of pivotally-mounted door members having upper and lower pivotal supports, the lower pivot being in the form of a bracket having portions extending both above and below the track, the lower portion being pivoted to a support below the track, and the upper portion being connected to the bottom of the door.

4. In mine-shaft doors, a pair of pivotally-mounted door members having arcuate faces and arranged to swing into recesses in the entry, a door-frame having battens, and projecting battens or ribs carried by the door members and in engagement therewith and serving to prevent the passage of air-currents.

5. In mine-doors, a pair of pivotally-mounted door members each including upper and lower segments, radiating braces connecting the upper segments to the pivot-point, and door supporting and bracing members arranged at the lower ends of the doors and each provided with an arm extending downward and inward under the track or road-bed.

6. In mine-doors, a pair of pivotally-mounted door members having arcuate faces arranged to swing into recesses in the entry, a door-frame having battens, springs projecting from the said battens and projecting battens carried by the doors and adapted to engage the springs to thereby lessen the shock of closing movement of the doors.

7. In mine-shaft doors, a pair of pivotally-mounted door members having arcuate faces, a door-frame having battens lined with a flexible material, and battens or bars carried by the doors and also faced with flexible material.

8. The combination with a pivotally-mounted entry-door, of a pivoted door-operating lever, a flexible connection between the free end of the lever and door, a pair of levers extending across the entry, a flexible connecting means between one of the levers and the door-operating lever, a flexible connection between the second lever and the door-operating lever, and a guiding means for the second of such flexible connection.

9. The combination with a pivotally-mounted door, of a pair of shafts, bell-crank levers vertically adjustable on said shafts, a pivoted door-operating lever having flexible connection with the door, and flexible connections between such levers and the adjustable bell-crank lever.

813,068. **EXPLOSIVE-ENGINE-STARTING MECHANISM.** HENRY J. WIEGAND, Milwaukee, Wis. Filed May 21, 1904. Serial No. 209,018.

Claim.—The combination with an explosive-engine shaft, a starting-crank therefor, a catch for locking the crank to the shaft, a cam-lever for controlling the catch, a pawl for controlling the movement of the lever and a stationary part arranged to move the pawl to disengage the catch when the shaft is moved in a reverse direction.

813,069. **LEVEE.** FRANK V. WRIGHT, San Francisco, Cal. Filed Sept. 12, 1905. Serial No. 278,140.

Claim.—1. A levee comprising a previously-established bank, side barriers extending along the top edges of said bank and consisting of horizontally-laid willow bundles, and earthy material on the bank between said barriers and permeating their interstices.

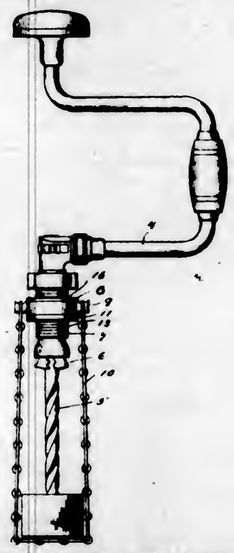
2. A levee comprising a previously-established bank, side barriers extending along the top edges of said bank and consisting of horizontally-laid willow bundles, together with their growing roots and branches, and earthy material on the bank between said barriers and permeating their interstices.

3. A levee comprising a previously-established bank, side barriers extending along the top edges of said bank, and consisting of horizontally-laid willow bundles, willow stakes holding said bundles in position, and earthy material on the bank between said barriers and permeating their interstices.

4. A levee comprising a previously-established bank, side barriers extending along the top edges of said bank and consisting of horizontally-laid willow bundles, together with their growing roots and branches, willow stakes holding said bundles in position, and earthy material on the bank between said barriers and permeating their interstices.

813,070. **ATTACHMENT FOR WOOD-BORING BRACES.** DAVID B. YOUNG, Guthrie, Okla. Filed July 18, 1905. Serial No. 270,174.

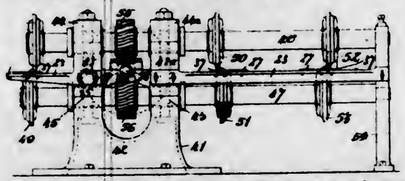
Claim.—1. The combination with the jaw-clamping sleeve of a boring-brace, said sleeve being threaded externally and driven by the ordinary rotation of the brace, of an internally-threaded member working on said sleeve, and a clamping-chain, the ends of which are carried by the aforesaid member.



2. The combination with the jaw-clamping sleeve of a boring-brace, said sleeve being threaded externally and rotated by the ordinary rotation of the brace, of an internally-threaded member working on said sleeve, a rotatable ring carried by the aforesaid member, and a clamping-chain, the ends of which are secured to the ring.

3. The combination with a boring-brace having a jaw-clamping sleeve rotatable with the spindle of the brace, said sleeve being threaded exteriorly, of an internally-threaded inner ring on said sleeve, the threads being arranged to cause the ring to travel inwardly when the brace is turned to drive the bit or drill, an outer ring rotatably mounted on said ring and having a clamping-chain attached thereto, and antifriction-bearings between the rings constructed to give less friction therebetween than between the sleeve and the inner ring, so that normally the sleeve and the inner ring turn together.

813,071. **METAL-CUTTING MACHINE.** JAMES ABBOTT, Newport, England. Filed Oct. 11, 1904. Serial No. 228,068.



Claim.—1. A machine for cutting or shearing metal sheets or plates comprising a standard, a pair of shafts borne thereby, said shafts projecting on either side of said standard and on one side each shaft carrying a single circular knife or cutter and on the other side a plurality of circular knives or cutters with means for rotating said shafts substantially as described.

2. A machine for cutting or shearing metal sheets or plates, comprising fixed and loose standards, a pair of shafts borne thereby and projecting unequal distances on either side of said fixed standard, the shorter projecting portions of said shafts respectively carrying a single circular knife or cutter and the longer portions of said shafts respectively carrying a plurality of circular knives or cutters, with suitable gearing in connection with said shaft substantially as described.

3. A machine for cutting or shearing metal sheets or plates, comprising fixed and loose standards, a pair of shafts borne thereby and projecting unequal distances on either side of said fixed standard, the shorter projecting portions of said shafts respectively carrying a single circular knife or cutter and the longer portions of said shafts respectively carrying a plurality of circular knives or cutters, with suitable gearing in connection with said shafts and means for supporting and guiding the sheets or plates and regulating the amount of scrap to be cut off substantially as described.

4. A machine for cutting or shearing metal sheets or plates comprising a standard, a pair of shafts borne thereby said shafts projecting on either side of said standard, and on both sides each shaft carrying a single circular knife or cutter, with suitable gearing in connection with said shafts, and means for supporting and guiding the sheets or plates, and regulating the amount of scrap to be cut off substantially as described.

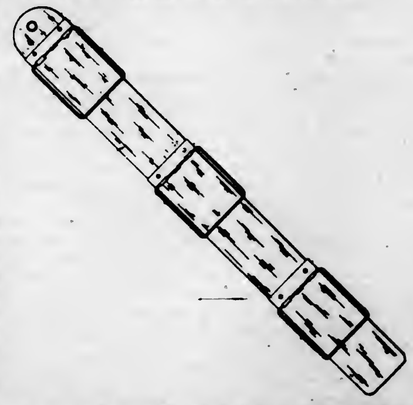
5. A machine for cutting or shearing metal sheets or plates comprising fixed and loose standards, a pair of shafts borne thereby, said shafts projecting on either side of said fixed standard, and on both sides each shaft carrying a plurality of circular knives or cutters, with suitable gearing in connection with said shafts, and means for supporting and guiding the sheets or plates and regulating the amount of scrap to be cut off substantially as described.

6. In means for cutting or shearing metal sheets or plates, the combination therewith of supporting guiding and regulating mechanism for the sheets or plates consisting of brackets adapted to be adjustably connected to the standards and support adjacent to each pair of cutters, a platform and guide, each of said platforms having adjustably fixed thereto at its forward end a slotted arm carrying a marking-disk, substantially as described.

7. In means for cutting or shearing metal sheets or plates the combination therewith of supporting guiding and regulating mechanism for the sheets or plates consisting of brackets adapted to be adjustably connected to the standards and support adjacent to each pair of cutters, a platform, angle-iron guide, and a spring-controlled arm carrying a guide-roller, each of said platforms having adjustably fixed at its forward end a slotted arm carrying a marking-disk, substantially as described.

8. In means for cutting or shearing metal sheets or plates, the combination therewith of supporting, guiding and regulating mechanism for the sheets or plates consisting of brackets adapted to be adjustably connected to the standards and support adjacent to each pair of cutters, a platform, angle-iron guide and a spring-controlled arm carrying a guide-roller each of said platforms having adjustably fixed at its forward end a slotted arm carrying a marking-disk, said forward end of each platform (for adjusting this to the condition of the plates) also having pivoted thereto a link provided with a series of holes adapted for adjustable connection by a pin or bolt to a member having a like series of holes, said member being connected to the foundation or other support of the machine substantially as described.

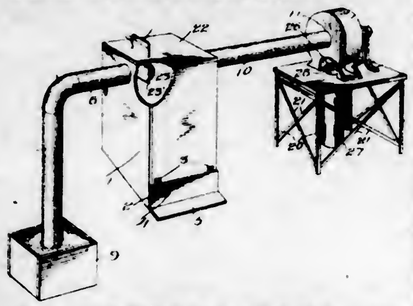
813,072. **SHOE AND SLIPPER HANGER.** CHARLES ACKROYD, Paterson, N. J. Filed July 21, 1904. Serial No. 217,547.



Claim.—A display-rack consisting of a support, a base-plate secured to said support, a retaining-frame hinged on said plate and a

hook projecting at right angles from said frame, said hook and frame formed from a single piece of wire.

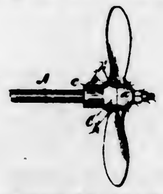
813,073. PNEUMATIC GRAIN-ELEVATOR. WILLIAM C. ALLEN, Gurley, Ala. Filed May 10, 1905. Serial No. 259,744.



Claim.—1. In an apparatus of the class described, a vacuum-chamber, a feed-tubing connected therewith, a rotary fan, connections between the fan and the vacuum-chamber, means for rotating the fan, a discharge-tube arranged beneath the fan, and a flexible baffle-plate adjustably mounted in the upper end of the vacuum-chamber.

2. In an apparatus of the class described, a vacuum-chamber, a rotary fan, connections between the fan and the vacuum-chamber, means for rotating the fan, a discharge-tube arranged beneath the fan, a baffle-plate composed of spring metal and secured to the top of the vacuum-chamber, and spaced arms connected at the top by a cross-piece and at the bottom to the lower edge of baffle-plate to adjust the said baffle-plate.

813,074. BOAT-PROPELLER. CHARLES B. BARBER, Syracuse, N. Y. Filed Apr. 13, 1905. Serial No. 255,366.



Claim.—1. In a boat-propeller of the class described, the combination of a rotary shaft, a wheel mounted on said shaft and comprising a set of radially-disposed pivoted blades, a member operative for axially turning said blades to regulate the pitch thereof, and a manually-operated revoluble sleeve mounted on the shaft and actuating said member as set forth.

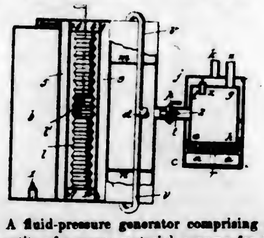
2. In a boat-propeller of the class described, the combination of a rotary shaft, a wheel mounted on said shaft and comprising a hollow hub and a set of radially-disposed blades pivoted to the hub, a member disposed within the hub operative for axially turning the blades to regulate the pitch thereof, a manually-operated sleeve movable on the shaft and extending into the hub for actuating said member, and clamping means engaging the sleeve for retaining the blades in their adjusted positions as set forth.

3. In a boat-propeller of the class described, the combination of a rotary shaft, a wheel mounted on said shaft and comprising a hub having a hollow portion and a set of radially-disposed blades pivoted thereto, an exteriorly-screw-threaded sleeve revolubly embracing the shaft and extending into the hub, means for sustaining the sleeve against endwise movement, and a nut mounted on the sleeve within the hub and engaging the blades and operative for turning the latter axially to regulate the pitch thereof.

4. In a boat-propeller of the class described, the combination of a rotary shaft provided with a screw-thread at its rear end portion, a wheel comprising a hub having a hollow transversely-divided spherical portion, the inner section being rigidly secured to the shaft, and the outer section removable, and provided with an axial opening through which the shaft protrudes, the said hub formed with radially-disposed openings at the line of division, blades pivoted in said openings and provided with slotted portions at their pivoted ends within the hub, an exteriorly-screw-threaded sleeve mounted revolubly on the shaft and extending through the aforesaid axial opening and provided with a head abutting against the exterior of the hub to prevent inward movement of the sleeve, and by which the sleeve turned, a nut mounted on the sleeve within the hub and provided with studs engaging the slotted portions of the blades, whereby the rotation of the sleeve shifts the nut longitudinally to turn the blades axially to regulate the pitch of the latter, and a jam-nut mounted on the shaft serving to sustain the sleeve against outward movement and to lock the blades in their adjusted positions as set forth.

5. In a boat-propeller of the class described, the combination of a rotary shaft, a wheel mounted thereon and comprising a hollow hub and radially-disposed blades pivoted thereto and provided with transversely-slotted collars within the hub, an exteriorly-screw-threaded sleeve mounted revolubly on the shaft and extending into the hub, means for sustaining the sleeve against endwise movement, means for revolving the sleeve, a nut mounted on the sleeve within the hub and provided with studs on its edges engaging the slotted collars, whereby the blades are turned axially to regulate the pitch of said blades, and means for locking the blades in their adjusted positions as set forth.

813,075. GENERATOR OF FLUID-PRESSURE. ADRIEN BAUDIN, Paris, France. Filed Aug. 5, 1905. Serial No. 268,325.



Claim.—1. A fluid-pressure generator comprising a chamber containing a quantity of aqueous material, a pump for drawing air through said material, a chamber into which the cooled and moistened air is delivered, and means for heating said last-named chamber.

2. A fluid-pressure generator, comprising a chamber containing means for cooling and moistening air, a pump for drawing air through said chamber, a tank for receiving the cold damp air from said pump, and a heating-chamber communicating with said tank.

3. In a fluid-pressure generator, a chamber containing cold aqueous material, an inlet-pipe having a check-valve and opening near the bottom of said chamber, an air-pump taking air from said chamber, a pressure-tank receiving air from said pump, and a heating-chamber connected with said tank.

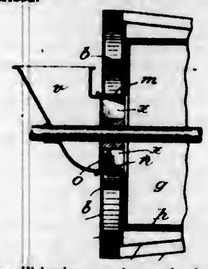
4. A fluid-pressure generator, comprising a chamber containing cold water, an inlet-pipe for said chamber having an inwardly-opening check-valve, a compartment communicating with said chamber, an air-pump connected with said compartment, a tank receiving the cold damp air drawn by said pump from the chamber, means for keeping the air in said tank under pressure, a heating-chamber, a pipe connecting said chamber with the tank, and a stop-cock in said pipe.

5. A fluid-pressure generator, comprising a chamber for cold water, an air-pump connected with said chamber and drawing air through the water, a tank into which said pump delivers the cold damp air, floating pistons in the ends of said tank, means for maintaining fluid-pressure behind said pistons, a furnace, a heating-chamber in said furnace, and a pipe connecting said heating-chamber with the tank and provided with a stop-cock and a check-valve.

813,076. DRUM-MILL. RICHARD BEHRER, Bromberg, Germany. Filed Jan. 18, 1905. Serial No. 241,607.

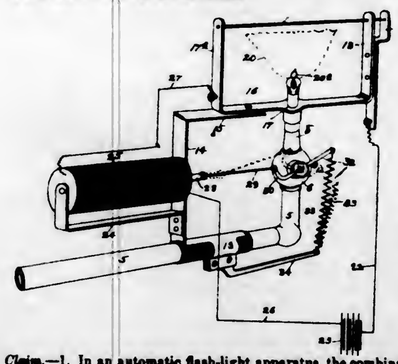
Claim.—1. In a drum-mill having a casing at the drum end, communicating with the outer shell of the drum, and presenting blades running from the periphery toward the center; in combination, a central boss for the drum-shaft, having a perforated rim, communicating peripherally with the casing and laterally with the grinding-drum; spirally-curved vanes in the interior of the boss, rotating against the direction of fall of material through the perforated rim, located one below each aperture in the latter; a perforated partition dividing the hopper from the boss; and means for preventing the

hopper charge from passing through the perforated boss-rim, substantially as described.



2. In a drum-mill having a casing at the drum end, communicating with the outer shell of the drum, and presenting blades running from the periphery toward the center; in combination, a central boss for the drum-shaft, having a perforated rim, communicating peripherally with the casing and laterally with the grinding-drum; spirally-curved vanes in the interior of the boss, rotating against the direction of fall of material through the perforated rim, located one below each aperture in the latter; a perforated partition dividing the hopper from the boss; and scoop-shaped members located between the said vanes, for preventing the hopper charge from passing through the perforated boss-rim, substantially as described.

813,077. AUTOMATIC FLASH-LIGHT APPARATUS. STANISLAUS BERENS, La Grange, and ABRAHAM N. GATHERT, Chicago, Ill. Filed June 23, 1905. Serial No. 266,405.

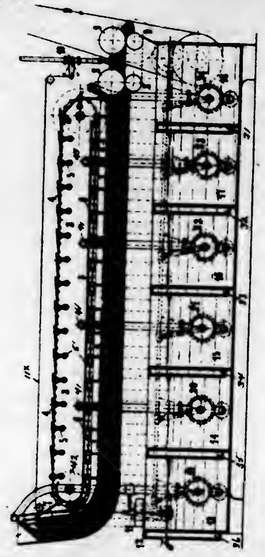


Claim.—1. In an automatic flash-light apparatus, the combination with a gas-fixture, of a gas-regulating valve mounted thereon, an expansible piece mounted above the fixture in the path of the heat of the flame therefrom, an electromagnet in circuit with the expansible piece, means connecting the valve and said magnet whereby the valve will be turned when the circuit is completed so as to decrease the flow of gas, and a spring connected to the valve to turn the same when the circuit is broken so as to increase the flow of gas, substantially as described.

2. In an automatic flash-light apparatus, the combination with a gas-fixture, of a regulating-valve for controlling the flow of gas mounted thereon and having a projecting stem, oppositely-extending levers or arms on said stem, a yoke mounted on the burner of the fixture, an expansible piece carried by the yoke, a contact-strip secured to the yoke but insulated therefrom, a battery and a hollow electromagnet electrically connected together, a conductor connecting the magnet and yoke and a conductor connecting the contact-strip and battery, a plunger movably located in the hollow of the magnet and loosely connected to one of the arms on the valve-stem, and a spring connected at one of its ends to the other of said arms and suitably secured at its other end, substantially as described.

813,078. POTASH LEACHING APPARATUS. ERNST F. BERNHARDT, Leipsig, Germany. Filed June 4, 1904. Serial No. 211,866.

Claim.—1. A potash leaching apparatus for raw wool consisting of a reservoir, a channel having a perforated bottom located over said reservoir, rakes for feeding the wool in said channel, pressing-rollers placed at the end of the channel and means for sprinkling the wool as it passes along the channel, said means taking its supply from the reservoir.



2. A potash leaching apparatus consisting of a channel having a perforated bottom, reservoirs placed under the channel, sprinkler-pipes arranged over the channel, means for raising the liquid from the reservoirs to said pipes said reservoirs having communicating openings through which the liquid flows from one to the other, said flow being controlled by the inflow of water to the last compartment, and a float regulating the height of liquid in said last compartment.

3. A potash leaching apparatus comprising a series of reservoirs having communicating openings, a perforated channel placed above the same, a series of sprinkler-tubes placed over the channel and pumps for raising the water from the reservoirs to the sprinkler-tubes, said tubes being so placed that the water raised from each reservoir will be returned to the same.

4. A potash leaching apparatus consisting of a series of reservoirs having communicating openings, a perforated channel placed above the reservoirs, rakes for feeding the wool through the channel, sprinkler-tubes placed over the channel, pumps for raising the liquid from the reservoirs to the tubes, said tubes being so placed that the liquid will be returned to the reservoir from which it was raised and pressing-rollers placed at the end of the channel and adapted to receive the wool therefrom.

813,079. SEAL-PRESS. EDWARD J. BROOKS, East Orange, N. J. Filed Dec. 26, 1902. Serial No. 136,731.

Claim.—1. A seal-press having a movable die, means for reciprocating the same, and a ratchet device, for insuring complete movements of said die, comprising a pawl carried by said die and a ratchet-bar fixedly held in the body of the press and arranged to intermesh with said pawl during each pressing movement.

2. A seal-press having a movable die, means for reciprocating the same, and a ratchet device, for insuring complete movements of said die, comprising a spring-pressed pawl and a pivotal support

therefor carried by said die and a ratchet-bar fixedly held in the body of the press and arranged to intermesh with said pawl during each pressing movement.

tween said sides and partitions, and a blade pivoted between said partitions, and means for clamping said sides and partitions on said blades.

said magnetized shaft, a permanent magnet or magnets supported by

which is declined inwardly throughout the thickness thereof, and a

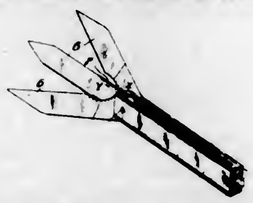
therefor carried by said die and a ratchet-bar fixedly held in the body of the press and arranged to intermesh with said pawl during each pressing movement.

3. A seal-press having a movable die, means for reciprocating the same, and a ratchet device, for insuring complete movements of said die, comprising a spring-pressed pawl and a pivotal support therefor carried by said die and a ratchet-bar constructed with a pair of reversing-notches and with ratchet-teeth between said notches arranged to intermesh with said pawl during each pressing movement.

4. A seal-press comprising a recessed body part, a spring-retracted movable die within said body part, a handle part pivoted to said body part and adapted to impart the pressing movements to said die, a spring-pressed pawl and a pivot therefor carried by said die, and a ratchet-bar fixedly held within said body part and arranged to intermesh with said pawl throughout each pressing movement.

5. A seal-press comprising a body part having a cylindrical recess parallel with and in communication with the customary die-guiding recess, a spring-retracted movable die within the recess last named, a handle part pivoted to said body part and adapted to impart the pressing movements to said die, a spring-pressed pawl and a pivot therefor carried by said die, and a cylindrical ratchet-bar fastened within said cylindrical recess and arranged to intermesh with said pawl throughout each pressing movement, substantially as hereinbefore specified.

813,080. **VETERINARY SURGICAL INSTRUMENT.** WELDON B. COMPTON, Limmas, Mont. Filed Mar. 8, 1905. Serial No. 249,053.



Claim.—1. A knife-blade having a dull serrated portion and a sharpened edge merging directly into and forming an uninterrupted and even continuation of said serrated edge, said serrated portion and sharpened edge extending in the same general direction.

2. A knife-blade having a concaved or depressed dull serrated portion and a sharpened edge merging directly into and forming an uninterrupted and even continuation of said serrated edge, said serrated portion and sharpened edge extending in the same general direction.

3. A knife-blade having both edges sharpened and a dull toothed portion forming a continuation of each edge.

4. In a device of the class described, the combination with a sheath having an aperture, of a knife-body adapted to be contained in said sheath, and means integral with said body adapted to engage the edge on the sheath formed by the aperture whereby the body is locked in the sheath.

5. In a device of the class described, the combination with a sheath having an aperture, of a knife-body adapted to be contained therein, and a catch integral with one end of the body but centrally out of line with the said aperture, said catch adapted to engage the edge on the sheath formed by the aperture whereby the body is locked in the sheath.

6. In a device of the class described, the combination with a sheath having an aperture, of a knife-body, and a catch carried by said knife-body adapted to spring into said aperture and engage the edge formed thereby.

7. In a device of the class described, the combination with a sheath having a central aperture, of a knife-body adapted to loosely fit said sheath at one end, and means eccentrically mounted on the one end of the knife-body adapted to engage the edge formed by the aperture when the body is forced in the sheath.

8. In a device of the class described, the combination with a sheath, of a knife-body adapted to fit the sheath closely at one end and loosely at the opposite end, and means carried by the body at the loose end adapted to lock with the sheath.

9. In a device of the class described, the combination with a knife-body comprising sides, of blades pivoted between said sides, and means for compressing said sides.

10. In a device of the class described, the combination with a knife-body comprising sides and partitions, of blades pivoted between said sides and partitions, and a blade pivoted between said partitions, and means for clamping said sides and partitions on said blades.

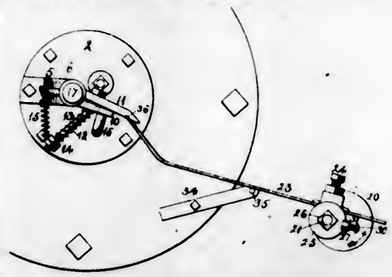
11. In a device of the class described, the combination with a knife-body comprising sides, of blades loosely pivoted between said sides, and a sheath adapted to fit over said body and clamp said sides on said blades.

12. In a device of the class described, the combination with a knife-body comprising sides and partitions, of blades loosely mounted between said sides and partitions, a blade loosely mounted between said partitions, and a sheath adapted to fit over said body and clamp said sides and partitions on the said blades.

13. In a device of the class described, the combination with a knife-body comprising sides, of blades loosely pivoted between said sides, means for clamping said sides on said blades, and means for locking said body to said clamping means.

14. In a device of the class described, the combination with a knife-body comprising sides, of blades loosely pivoted between said sides, a sheath adapted to fit over said body and clamp said sides to the blades, and means carried by the body adapted to engage said sheath to lock the body and sheath together, said means facilitating the removal of the body from the sheath.

813,081. **SPARKING IGNITER FOR EXPLOSIVE-ENGINES.** GEORGE CORMACK, Jr., and FREDERICK C. SUNDAHL, Rockford, Ill. Filed Feb. 5, 1904. Serial No. 192,105.



Claim.—1. An igniter for gasolene-engines, comprising two points, one being movable, an arm having a connection with the movable point, and an operating-bar having one end provided with a notch forming two sections, said bar being movable transverse to its length to bring either section of the end under the arm, in order that the time of ignition may be changed.

2. An igniter for gasolene-engines, comprising two points, one being movable, an arm having a connection with the movable point, a rotary crank-pin, a collar supported by the crank-pin and having a movement in the lengthwise direction of the crank-pin, means for holding the collar in its adjusted positions, and an operating-bar supported by the collar having a notch in one end capable of engaging the arm, in order that the time of ignition may be changed.

3. An igniter for gasolene-engines, comprising two points, one being movable, an arm having a connection with the movable point, a rotating crank-pin, a collar supported by the pin and having a movement in the lengthwise direction of the crank-pin, a disk supported by the crank-pin, a spring-actuated latch provided with a series of notches capable of receiving the edge of the disk and a bar supported by a collar having a notch in one end capable of engagement with the arm.

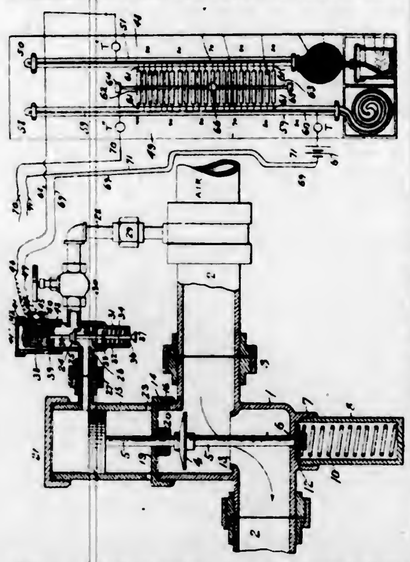
813,082. **MECHANICAL AND MAGNETIC TOY.** HERBERT CORTRELL, Newark, N. J. Filed Feb. 27, 1903. Serial No. 6,709.

Claim.—1. A mechanical and magnetic toy, comprising a frame, a central spindle having bearings in said frame, and carrying a non-magnetic table-plate having an iron rim upon its periphery, a magnetic shaft having a balance-wheel fixed thereon, and having its upper end in contact with the iron rim, bearings in the frame for the said magnetized shaft, a permanent magnet or magnets supported by the frame beneath the table-plate, and magnetized objects on top of said table-plate, substantially as shown and described.

2. A mechanical and magnetic toy, comprising a main frame having bearings to support a shaft carrying a balance-wheel, a table-plate fixed upon a spindle held in bearings in said frame, adapted to be rotated by motion imparted by said balance-wheel; in combination with a magnet or magnets so disposed and held, that movable permanently-magnetized objects placed upon the said table-plate may be alternately attracted and repelled by the said magnet or magnets, substantially as described.

3. A mechanical and magnetic toy, comprising a rotatable non-magnetic table or carrier, having an iron peripheral rim; a rotatable magnetized shaft held in a frame in bearings, and having a balance-wheel fixed thereon; the said iron peripheral rim arranged in contact with the said magnetized shaft to adapt it to be rotated by magnetic attraction, substantially as described.

813,083. **ELECTRICALLY-CONTROLLED REGULATING-VALVE FOR HUMIDIFYING AND HEATING SYSTEMS.** STUART W. CRAMER, Charlotte, N. C. Filed Dec. 29, 1904. Serial No. 238,818.



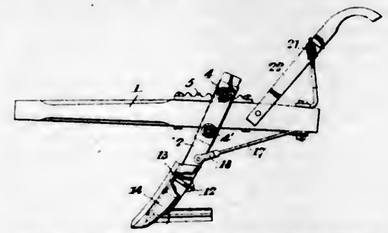
Claim.—1. A fluid-service pipe, a main valve to control the fluid therein, and a supplemental valve controlling the fluid to operate the main valve; in combination with a source of electrical energy, means for indicating temperature and means for indicating humidity, each of said means being adapted to close an electric circuit, separate electrical conductors connecting said source of electrical energy with each of said means, one of said conductors including an electromagnetic device, a plurality of electrical conductors connecting said means, and each of said latter conductors uniting selected points on the indicating means.

2. A fluid-service pipe, a main valve to control the liquid therein, and a supplemental valve controlling the fluid to operate the main valve; in combination with a source of electrical energy, a dry-bulb thermometer and a wet-bulb thermometer, each of said thermometers being adapted to close an electric circuit, separate electrical conductors connecting said source of electrical energy with each of said thermometers, one of the said conductors including an electromagnetic device, a plurality of electrical conductors connecting said thermometers, each of said latter conductors uniting selected points on the dry-bulb thermometer with selected points on the wet-bulb thermometer.

813,084. **SETTING.** GEORGE W. DOVER, Cranston, R. I. Filed Aug. 26, 1905. Serial No. 275,780.

Claim.—A gem-setting comprising a bushing the upper edge of which is declined inwardly throughout the thickness thereof, and a shell surrounding and extending above the bushing and having an interned flange at its lower end disposed immediately below the lower edge of the bushing and also having a margin a' extending upwardly from the inner edge of the said flange and arranged against the inner side of the lower portion of the bushing.

813,085. **COTTON-SCRAPER.** JAMES D. FAIRLESS, Iuka, Miss. Filed Sept. 25, 1905. Serial No. 280,011.



Claim.—1. In a cotton-scraper, a beam, a pair of standards connected with and spaced from the sides of the beam, downwardly and outwardly inclined foot-pieces at the lower ends of the standards, and blades supported adjustably upon the latter.

2. In a cotton-scraper, a beam, a pair of standards spaced from and connected with opposite sides of the beam, flanged foot-pieces forming runners at the lower ends of the standards, and flanged blades supported adjustably upon the standards.

3. A beam, standards disposed at opposite sides of the beam, clamping-bolts connecting said standards, bifurcated braces connected with the standards and extending rearwardly and abutting upon the under side of the beam, an upright brace supported upon the beam and having a screw-threaded upper end, a bolt extending through the upright brace, the beam, and the bifurcated braces, handles connected pivotally with the beam, a rung connecting the handles and apertured for the passage of the screw-threaded brace, and clamping-nuts upon the latter.

813,086. **PASTE-POT.** ROBERT P. FRIST, Bridgeton, N. J., assignor to S. S. Stafford, Incorporated, New York, N. Y., a Corporation of New York. Filed Nov. 17, 1905. Serial No. 287,768.

Claim.—1. In a paste-pot, the combination of an outer well having a recess in its bottom, and an inner well having an extended base fitting into said recess, the upper surface of the extended base being flush with the bottom of the outer well.

2. In a paste-pot, an inner well having a foot enlargement cut away in part to prevent rotation and an outer well having a recess shaped to receive said foot enlargement.

3. An outer and an inner well, the outer well having a recess and the inner well having an extended base fitting the recess in the outer, and a holding device therefor, for substantially the purposes set forth.

4. An outer and an inner well, the outer well having a recess and the inner well having an extended base fitting the recess in the outer, and a disk or washer overlying the extended base of the inner well.

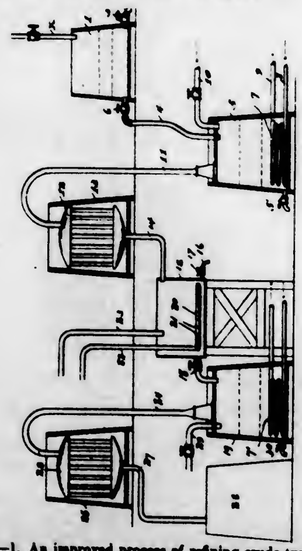
813,087. ILLUMINATING-SIGN. ABRAHAM H. GATHERT, Chicago, and STANISLAUS BIENIEK, La Grange, Ill. Filed Apr. 26, 1905. Serial No. 257,282.

Claim.—1. The combination with a casing having an opening in one of its walls, of a sign-plate located in said opening, a rotary drum mounted in the casing and having a transparent portion, a wing hinged to the front portion of the casing at each side of the opening therein, and projecting inwardly to near the drum, and means to rotate said drum by the heat from the light-producing flame, substantially as described.

2. The combination with a casing having an opening in one of its walls, of a sign-plate located in said opening, a rotary drum mounted in the casing and having a transparent portion, a wing pivotally secured on each side of the opening in the casing and extending inwardly toward the drum, a propeller mounted on the upper end of the drum and comprising a series of radially arranged and deflected blades, a vertical shaft supporting said propeller and a vertical wing secured to said shaft, substantially as described.

3. The combination with a casing having an opening in its front wall and an opening in its rear wall, of a sign-plate located in the front opening, a shaft vertically journaled in the casing, a rotary drum mounted in the casing and having a transparent portion, a vertical wing on said shaft, and means to rotate said drum by the heat from the light-producing flame, substantially as described.

813,088. PROCESS OF REFINING TURPENTINE. GEORGE C. GILMER, New Orleans, La., assignor, by mesne assignments, to American Turpentine and Tar Company, Limited, New Orleans, La., a Corporation. Filed Jan. 24, 1903. Serial No. 140,336.

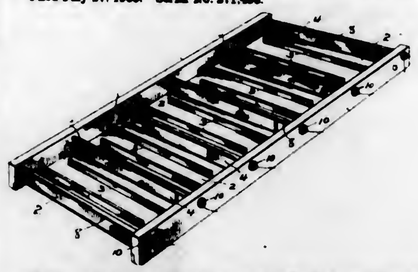


Claim.—1. An improved process of refining crude turpentine, produced by dry distillation of turpentine-bearing wood which consists in first allowing the crude distillate to settle and then separating the turpentine-oil from the liquids of greater specific gravity by decanting, next adding to the turpentine-oil a large proportion of pure water, and distilling the mixture at a temperature sufficient to vaporize both water and turpentine, condensing the vapors of distillation, and again separating the turpentine-oil from the liquids of greater specific gravity by settling and decanting, next neutralizing the acid impurities of the turpentine-oil by introducing gradually a liquid alkali and maintaining an agitation during such addition of the alkali, arresting the introduction of alkali and the agitation of the mixture when the neutralization has been completed, allowing the mixture to settle and separating again by decantation, and finally redistilling the turpentine-oil in the presence of water and condensing and separating the turpentine and water vapors.

2. The process of refining crude turpentine produced by the destructive distillation of pine which consists in first separating the turpentine from the pyroligneous acid by settling, next adding approximately fifty per cent. of pure water and distilling the mixture at a temperature above that at which the water is vaporized, condensing the vapors of distillation, and allowing the liquids to settle and separate, next decanting off the water and adding to the remaining turpentine lime-water, then subjecting the mixture of turpentine and lime-water to air and an agitating process, next decanting off the lime-water and subjecting the turpentine to a second distillation, and finally condensing the turpentine-vapor.

3. An improved process of refining turpentine, which consists in first separating the turpentine from the pyroligneous acid contained therein, next adding approximately fifty per cent. of pure water and distilling the mixture at a temperature above that at which the water is vaporized, condensing the vapors of distillation, and allowing the liquids to settle and separate, next decanting off the water and adding to the remaining turpentine lime-water, then subjecting the mixture of turpentine and lime-water to an aerating and agitating process, next decanting off the lime-water, and then distilling the turpentine at a temperature of approximately 335° Fahrenheit, by means of heat transmitted to the turpentine from a body of water upon which the turpentine is supernatent and finally condensing the turpentine-vapor.

813,089. EVAPORATING-PAN. JOHN P. GOLDEN, Columbus, Ga. Filed July 27, 1905. Serial No. 271,486.



Claim.—In a device of the character described, the combination of side timbers, pan-sections, flanged edges on the pan-sections of semicylindrical form at their upper edges and having tongues at their ends located in recesses in the timbers, open coupling-cylinders on the curved adjacent flanges and brace-rods passed through all of said cylinders thus formed and through the timbers, and nuts on said rods.

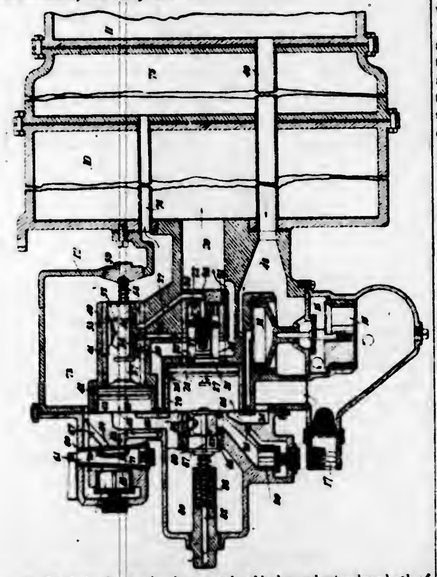
813,090. AIR-BRAKE MECHANISM. ALVA L. GOODENIGHT, Council Bluffs, Iowa. Filed Sept. 6, 1905. Serial No. 277,238.

Claim.—1. In air-brake mechanism, a pair of independent valves arranged between and controlling the flow of air from the auxiliary reservoir to the brake-cylinder, and independent pistons connected to the valves, one of said valves serving also as a brake-release valve.

2. In air-brake mechanism, a pair of independent piston-connected valves both operable by variations of train-pipe pressure and both of which are movable on reduction of such pressure to permit the flow of air from the auxiliary reservoir to the brake-cylinder, one of the valves serving also to control the exhaust of air from the brake-cylinder.

3. In air-brake mechanism, a pair of independent piston-operated valves arranged in separate cylinders, both of which are exposed to train-pipe pressure, both valves being movable to control the flow of air from the auxiliary reservoir to the brake-cylinder, one of the valves serving as a brake-release and the piston of the other valve controlling the recharging of the auxiliary reservoir.

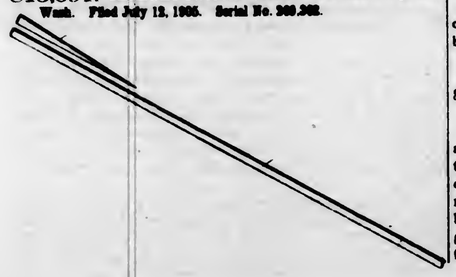
4. In air-brake mechanism, a pair of independent valves for controlling the flow of air from the auxiliary reservoir to the brake-cylinder, independent pistons connected to the valves, both of said pistons being exposed on one side to train-pipe pressure, primary and secondary auxiliary reservoirs, the pressure of the primary reservoir tending to oppose movement of one of said pistons under train-pipe pressure, the second piston being exposed to pressure from the secondary auxiliary reservoir, and means for varying the pressure in said secondary auxiliary reservoir.



5. In air-brake mechanism, a pair of independent valves both of which are movable to control the flow of air from the auxiliary reservoir to the brake-cylinder, one of said valves constituting also a brake-release valve, independent pistons connected to said valves and exposed on one side to train-pipe pressure, primary and secondary auxiliary reservoirs, the main piston being exposed on one side to pressure from the primary auxiliary reservoir and the piston of the second or brake-release valve being exposed to pressure from the secondary auxiliary reservoir, and means for varying the pressure in said secondary auxiliary reservoir.

6. In air-brake mechanism, a pair of cylinders, service and release pistons arranged in said cylinders, independent valves connected to said pistons, primary and secondary auxiliary reservoirs, the pressure of the primary auxiliary reservoir tending to oppose movement of the service-piston under train-pipe pressure, and the pressure of the secondary auxiliary reservoir tending to oppose movement of the release-piston under train-pipe pressure, a feed-groove under the control of the service-piston and through which air passes from the train-pipe to both reservoirs, and means for controlling communication between the two reservoirs.

813,091. TRAMWAY-SWITCH. OTTO C. H. GUNDERSEN, Spokane, Wash. Filed July 12, 1905. Serial No. 269,262.



Claim.—1. In a tramway-switch, the combination of a switch-tongue, a shaft, a driving connection intermediate the shaft and the tongue for moving the latter by the former, pinions fast on the shaft, a vertically-swinging sector-gear fulcrumed in rear of the shaft and having an arc-like opening receiving one of the pinions, and also having teeth on the forward wall of said opening intermeshed with said pinion, and a vertically-swinging sector-gear fulcrumed in rear of the shaft and having an arc-like opening receiving the other pinion, and also having teeth on the rear wall of the opening intermeshed with the latter pinion.

2. In a tramway-switch, the combination of a switch-tongue, a shaft, a driving connection intermediate the shaft and the switch-tongue for moving the latter by the former, pinions fast on the shaft, a vertically-swinging gear fulcrumed in rear of the shaft and having teeth disposed in rear of and intermeshed with one pinion, and a vertically-swinging gear fulcrumed in rear of the shaft and having teeth disposed in front of and intermeshed with the other pinion.

3. In a tramway-switch, the combination of main-track rails, turnout-rails, a horizontally-swinging switch-tongue abutting at its heel against one of the main-track rails, a pit disposed between the main-track rails, a pit-cover having longitudinally-extending parallel slots, a transverse shaft journaled in suitable bearings in the pit and bearing fast pinions and a fast miter-gear, a longitudinal rock-shaft having an upwardly-extending arm for moving the switch-tongue and also having a miter-gear intermeshed with that on the first-mentioned shaft, a vertically-swinging sector-gear fulcrumed in rear of the first-mentioned shaft and having an arc-like opening receiving one of the pinions and teeth on the forward wall of said opening intermeshed with said pinion, and also having its upper portion disposed in one of the slots of the pit-cover, and a sector-gear fulcrumed in rear of the first-mentioned shaft and having an arc-like opening receiving the other pinion, and teeth on the rear wall of the opening intermeshed with the latter pinion, and also having its upper portion disposed in the other slot of the pit-cover.

4. In a tramway-switch, a car equipped with a vertically-swinging arm, parallel wheels carried by said arm, means for returning the arm to and normally retaining the same in a raised position, and means for depressing the arm; in combination with a switch-tongue, a shaft, a driving connection intermediate the shaft and the switch-tongue for moving the latter by the former, pinions fast on the shaft, a vertically-swinging gear disposed in alinement with one of the mentioned wheels of the car and fulcrumed in rear of the shaft and having teeth disposed in front of and intermeshed with one pinion, and a vertically-swinging gear disposed in alinement with the other mentioned wheel of the car and fulcrumed in rear of the shaft and having teeth disposed in rear of and intermeshed with the other pinion.

813,092. THERAPEUTIC PAD. PERIAN B. HARDY, Tecumseh, Mich. Filed Oct. 13, 1904. Serial No. 228,315.

Claim.—A pad having a filling of asbestos fiber and a covering of asbestos cloth, and sheets of asbestos paper in the body of the pad, between the face and back thereof.

813,093. BINDING-POST. EDWIN C. HERR, Cleveland, Ohio. Filed May 9, 1905. Serial No. 259,895.

Claim.—1. An element for an electric battery-cell consisting of a rod of non-metallic substance having a bore in its outer end portion, a binding-post comprising conductor-attaching means at one end, and having at its other end portion longitudinally-extending ribs, said ribbed portion of the binding-post being inserted in said bore in the rod, the bore being of a diameter less than that of the engaging portion of the binding-post, whereby the ribs will have a retaining engagement with the wall of the bore.

2. An element for an electric battery-cell consisting of a rod of non-metallic substance having a bore in its outer end portion, a binding-post having a shank provided with a collar at an intermediate portion, the post being screw-threaded from said collar to one extremity, and the other extremity of the post being of a diameter greater than that of the bore in the rod, whereby the post will have a retaining engagement with the wall of the bore.

2. The combination of a silk backing-sheet, a stencil-sheet and a narrow strip of silk adapted to be carried by the ribbon-spools, the stencil-sheet being interposed between the backing and the strip,

mal-point having a head passing through said slot into the chamber and provided therein with side bars rendering the head cylindrical, ears extending from the lower bearing-plate over the ends of said

valves located above the bellows regulating the gas-supply thereto, openings for the discharge of water of condensation formed in the bottom of the bellows-chambers, valves at said openings and means

2. An element for an electric battery-cell consisting of a rod of non-metallic substance having a bore in its outer end portion, a binding-post having a shank provided with a collar at an intermediate portion, the post being screw-threaded from said collar to one extremity of the post, a nut engaging said threaded portion, the binding-post at the other side of said collar being provided with adjacent longitudinal extending ribs, said latter portion of the binding-post being inserted into said bore with the collar engaging the rod adjacent the bore, the said bore being of a diameter less than that of its engaging portion of the post, whereby said ribs will have a retaining engagement with the walls of the bore.

3. An element for an electric battery-cell consisting of a rod of non-metallic substance having a bore in its outer end portion, a binding-post having at one end portion longitudinally-extending ribs, said ribbed portion of the binding-post being inserted in said bore in the rod, the bore being of a diameter less than that of the engaging portion of the binding-post, whereby the ribs will have a retaining engagement with the wall of the bore.

4. The combination of a rigid non-metallic body having a bore therein, a binding-post comprising conductor-attaching means at one end and having at its other end portion longitudinally-extending ribs, said ribbed portion of the post being inserted in said bore in the body, the bore being of less diameter than that of the engaging portion of the post whereby the ribs will have a retaining engagement with the wall of the bore.

5. The combination of a rigid non-metallic body having a bore therein, a binding-post having a shank provided with a collar, the post being screw-threaded from the collar to one extremity, and nut on said threaded portion, the post at the other side of the collar being provided with longitudinally-extending ribs, said ribbed portion of the post being inserted in said bore with the collar engaging the body adjacent the bore, said bore being of a diameter less than that of the engaging portion of the post whereby the ribs will have a retaining engagement with the wall of the bore.

6. A binding-post provided with conductor-attaching means, at one end, and having a cylindrical shank at the other end portion provided with a circular series of longitudinally-extending ribs, disposed parallel with the axis of the shank.

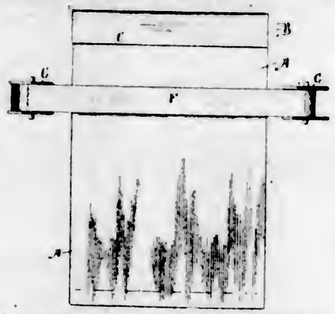
7. A binding-post provided with conductor-attaching means at one end, and having a cylindrical shank at the other end portion provided with a circular series of longitudinally-extending ribs, disposed parallel with the axis of the shank, the end portion of the shank being made tapering.

8. A binding-post comprising a shank having a flange at an intermediate portion, the post from said portion to one end being screw-threaded, a nut engaging such threaded portion, the shank of the post at the other side of the flange being substantially cylindrical and provided with a circular series of adjacent ribs extending substantially parallel with the axis of the shank.

813,094. **ATTACHMENT FOR CUTTING STENCILS.** GEORGE L. HELLEIS, Chicago, Ill., assignor to Airbo Duplicating Supply Company, Chicago, Ill., a Corporation of Illinois. Filed May 6, 1905. Serial No. 259,146.

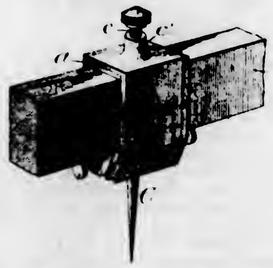
Claim.—1. The combination of a backing-sheet, a stencil-sheet and a strip adapted to be carried by the type-writer spools against which the type strikes to make an impression on the stencil-sheet, substantially as described.

2. The combination of a silk backing-sheet, a stencil-sheet and a narrow strip of silk adapted to be carried by the ribbon-spools, the stencil-sheet being interposed between the backing and the strip, and the backing and strip being adapted to receive and remove the particles of wax on opposite sides of the stencil-sheet when the strip is struck by the type, substantially as described.



3. The combination of a stencil-sheet, a flap-mounting at the head of the sheet secured thereto, a backing-sheet loosely inserted between the flaps of the mounting, and a silk strip adapted to be secured to a type-writer ribbon and carried by the ribbon-spools, and superimposed upon the stencil-sheet and adapted in combination with the backing to receive and remove the particles of wax on opposite sides of the stencil-sheet when the silk strip is struck by the type, substantially as described.

813,095. **TRAMMEL.** JOHN F. HOFFMAN, Dubuque, Iowa. Filed Apr. 7, 1905. Serial No. 254,363.



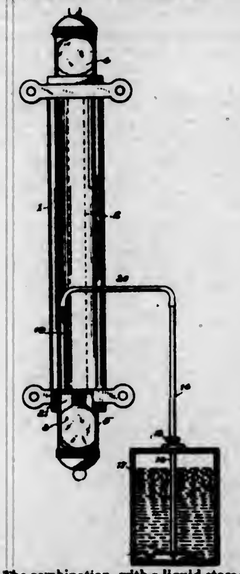
Claim.—1. In a trammel, the combination of the body, adapted to be adjustably supported on the beam, provided with a chamber and a slot communicating therewith, a trammel-point having a head passing through said slot into said chamber and snugly fitting in the latter, set-screw bearings at opposite ends of said chamber, and set-screws in said bearings between which said head is adjustably confined.

2. In a trammel, the combination of the body, adapted to be adjustably supported on the beam, having a cylindrical chamber and a rectangular slot communicating therewith, a trammel-point having a head passing through said slot into said chamber and provided therein with side bars rendering the head of cylindrical shape, and set-screws working in bearings on said body and between which said bead is adjustably confined.

3. In a trammel, the combination of a socket through which the beam passes, provided with means for fastening it in adjusted position on the beam, and having a cylindrical chamber in its base with a rectangular slot extending through said base into the chamber, a trammel-point having a head passing through said slot into said chamber and of cylindrical shape in the latter, and set-screws entering said chamber and between which said head is adjustably confined.

4. A trammel comprising, in combination, a socket containing upper and lower bearing-plates and through which the beam passes between said plates, a set-screw on the socket working against the upper plate, a cylindrical chamber in the base of the socket and a rectangular slot extending through said base into the chamber, a trammel-point having a head passing through said slot into the chamber and provided therein with side bars rendering the head cylindrical, ears extending from the lower bearing-plate over the ends of said chamber, and set-screws, between which said head is adjustably confined, working in said ears.

813,096. **LIQUID-INDICATOR.** HENRY A. HOUSE, Bridgeport, Conn. Filed May 23, 1905. Serial No. 261,573.



Claim.—1. The combination, with a liquid-storage tank and an indicating-gage, of a flexible air-compressor having an air-chamber, said compressor located at the bottom of the tank, a tube connecting said chamber with the gage so that, the pressure of the fluid on the compressor will force the air therefrom to the gage and give a reading thereon of the depth of liquid in the tank, for the purpose set forth.

2. The combination, with a liquid-storage tank, and an indicating-gage having an indicating glass tube, a flexible recording-liquid-holding reservoir communicating with the interior of said glass tube at the bottom, and a flexible air-reservoir at the top of said glass, said reservoirs inclosed by air-chambers, of a flexible air-compressor located at the bottom of said tank, said compressor having an air-chamber, a tube connecting said air-chamber with the air-chamber inclosing the liquid-holding reservoir of the indicator, for the purpose set forth.

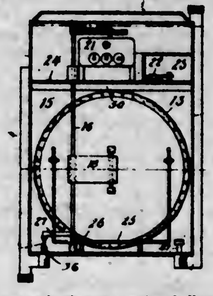
3. The combination, with a liquid-storage tank, and an indicating-gage, of a flexible air-compressor having an air-chamber, said compressor located at the bottom of said tank, protective covers for said compressor, a tube connecting the air-chamber of said compressor with the indicating-gage so that, the pressure of liquid on the compressor will force the air from its chamber to said gage and cause the depth of fluid in the tank to be noted thereon, for the purpose set forth.

813,097. **GAS-METER.** KIRK B. HOWARD, Chicago, Ill. Filed June 21, 1905. Serial No. 266,514.

Claim.—1. The dry gas-meter having its valve-chamber and slide-valves located above the measuring-bellows, and also having openings in the bottom of the bellows-chambers for drawing off the water of condensation, valves controlling such openings, and means for operating said valves.

2. In a gas-meter having its valve-chamber and slide-valves located above the measuring-bellows, and also having openings in the bottom of the bellows-chambers for drawing off the water of condensation, chambers under such openings discharging into the gas-supply pipe, valves controlling such openings, and means for operating said valves.

3. The dry meter having measuring-bellows and chambers, valves located above the bellows regulating the gas-supply thereto, openings for the discharge of water of condensation formed in the bottom of the bellows-chambers, valves at said openings and means whereby the last-mentioned valves may be operated at intervals by the bellows.



4. The dry meter having measuring-bellows and chambers, valves located above the bellows regulating the gas-supply thereto, openings for the discharge of water of condensation formed in the bottom of the bellows-chambers, valves at said openings, means whereby the last-mentioned valves may be operated at intervals by the bellows and chambers under said openings for trapping the water temporarily.

5. The dry meter having measuring-bellows and chambers, valves located above the bellows regulating the gas-supply thereto, openings for the discharge of water of condensation formed in the bottom of the bellows-chambers, valves at said openings, means whereby the last-mentioned valves may be operated at intervals by the bellows, chambers under said openings for trapping the water temporarily, and valves operated from the bellows and serving to discharge the water from said trapping-chambers.

6. The combination with a gas-meter of openings for draining off the water of condensation, valves controlling such openings, means for operating said valves and chambers under the openings for trapping the water temporarily, the discharge from such chambers being also controlled by automatic valves.

7. The combination with a gas-meter of openings for draining off the water of condensation, chambers under such openings adapted to trap the water temporarily, valves controlling said openings valves controlling the discharge from the trapping-chambers and means for operating said valves, said valves being open alternately.

8. In a gas-meter, the bellows-chamber whereof has a bottom opening for discharging water of condensation, a trapping-chamber receiving the water from said opening, a spring-operated valve at said opening, a spring operating-valve at the discharge from said trapping-chamber, and means whereby said valves are caused to open alternately.

9. In a gas-meter, the bellows-chamber whereof has a bottom opening for discharging water of condensation, a trapping-chamber receiving the water from said opening, valves controlling the entrance of the water in and its discharge from said trapping-chamber, and means whereby the valves are made to open alternately and to close alternately.

10. The combination with a dry meter and the house-supply pipe leading therefrom, of a water-passage conducting the water of condensation from said pipe to the diaphragm-chamber of the meter, and a check-valve in said passage whereby the condensation water in said pipe flows into the meter whenever an excessive amount accumulates in the former.

11. The combination with a dry meter and the house-supply pipe leading therefrom, of means for drawing off water of condensation from the diaphragm-chamber of the meter, a water-passage leading from said pipe to the diaphragm-chamber, and a check-valve in said passage adapted to yield whenever the water-pressure in the pipe becomes excessive.

813,098. **STEAM-GENERATOR.** WARREN S. JOHNSON, Milwaukee, Wis. Filed July 24, 1905. Serial No. 271,093.

Claim.—1. A vapor-generator, comprising a series of horizontally-disposed coils the convolutions of each coil extending in a direction reverse to that of the next adjacent coil, with the convolutions of one coil passing into spaces between the convolutions of the adjacent coil, the coils being connected in series.

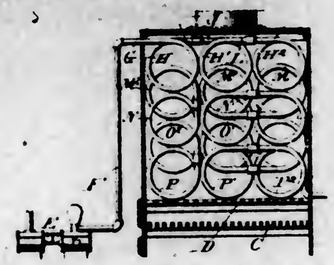
2. A vapor-generator, comprising a series of horizontally-disposed, serially-connected coils arranged one above another, the con-

linear numerator having an operating-shaft, a vertically-self-adjusting linear disk engaging the log or like material to be sawed, a

ratchet-wheel for said shaft, a ratchet-lever having a pawl adapted

disposed slot, a rack-bar for said cubic disk, a pinion meshing with

2. A vapor-generator, comprising a series of horizontally-disposed, serially-connected coils arranged one above another, the convolutions of each coil extending in a direction reverse to those of the next adjacent coil or coils, the proximate sections of the convolutions of each of the adjacent coils being nested.



3. A vapor-generator, comprising a series of horizontally-disposed, serially-connected coils, arranged in tiers, the convolutions of the adjacent coils in each tier extending in a direction reverse to those of the next adjacent coil or coils of such tier and in a reverse direction to the convolutions of the coil immediately below or above it in the next tier, the convolutions of the coils of each tier passing in between the proximate convolutions of the coils of the next adjacent tier.

4. A vapor-generator, comprising, in combination, a series of horizontally-disposed, serially-connected coils, the convolutions of each coil extending in a direction reverse to those of the next adjacent coil or coils, the proximate sections of the convolutions of each of the adjacent coils being nested; means for forcing liquid into the uppermost coil; and a source of heat located beneath the lowermost coil.

5. A vapor-generator, comprising, in combination, a series of serially-connected coils, said coils being arranged in horizontal tiers, the convolutions of each coil in each tier extending in a direction reverse to that of the next coil in such tier, with the convolutions of the coils in the next adjacent tier arranged in a reverse direction, whereby the proximate convolutions of the coils of the adjacent tiers may nest; a pump for forcing water into the first coil of the uppermost tier; and a source of heat located below the lowermost tier of coils.

6. A vapor-generator, comprising a series of coils, the convolutions of each coil extending in a direction reverse to that of the next adjacent coil, with the convolutions of one coil passing into spaces between the convolutions of the adjacent coil, the coils being connected in series.

7. A vapor-generator, comprising a series of horizontally-disposed, serially-connected coils arranged one above another, the convolutions of each coil extending in a direction reverse to those of the next adjacent coil or coils, the proximate vertically-disposed sections of the convolutions of each of the adjacent coils being nested.

813,099. NUMERATOR FOR SAWING-MACHINES. FRANZ L. KAHN, Glauchau, Germany. Filed Mar. 9, 1904. Serial No. 197,333.

Claim.—1. A measuring device for lumber-sawing machines including a linear numerator having an operating-shaft, a vertically-self-adjusting linear disk engaging the log or like material to be sawed, a ratchet-shaft, gears connecting the operating-shaft of said numerator with said ratchet-shaft, a ratchet-wheel for said ratchet-shaft, a pivotally-mounted ratchet-lever having a pawl adapted to engage said ratchet-wheel, a pin-wheel having projecting pins engaging said ratchet-lever and imparting thereto a rocking movement, a flexible belting whereby rotative movement is transmitted from said linear disk to said pin-wheel, and a gravity-acting weighted lever engaging said ratchet-lever and normally holding the same in engagement with said pins.

2. A measuring device for lumber-sawing machines including a linear numerator having an operating-shaft, a linear disk engaging the log or like material to be sawed, a ratchet-shaft, gears connecting the operating-shaft of said numerator with said ratchet-shaft, a ratchet-wheel for said shaft, a pivotally-mounted ratchet-lever having a pawl adapted to engage said ratchet-wheel, a pin-wheel having projecting pins engaging said ratchet-lever and imparting thereto a rocking movement, means whereby rotative motion is transmitted from said linear disk to said pin-wheel, and a source of heat located beneath the lowermost coil.

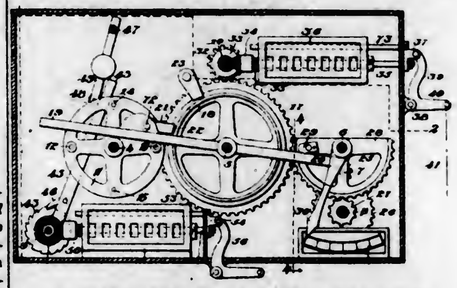
5. A vapor-generator, comprising, in combination, a series of serially-connected coils, said coils being arranged in horizontal tiers, the convolutions of each coil in each tier extending in a direction reverse to that of the next coil in such tier, with the convolutions of the coils in the next adjacent tier arranged in a reverse direction, whereby the proximate convolutions of the coils of the adjacent tiers may nest; a pump for forcing water into the first coil of the uppermost tier; and a source of heat located below the lowermost tier of coils.

6. A vapor-generator, comprising a series of coils, the convolutions of each coil extending in a direction reverse to that of the next adjacent coil, with the convolutions of one coil passing into spaces between the convolutions of the adjacent coil, the coils being connected in series.

7. A vapor-generator, comprising a series of horizontally-disposed, serially-connected coils arranged one above another, the convolutions of each coil extending in a direction reverse to those of the next adjacent coil or coils, the proximate vertically-disposed sections of the convolutions of each of the adjacent coils being nested.

813,099. NUMERATOR FOR SAWING-MACHINES. FRANZ L. KAHN, Glauchau, Germany. Filed Mar. 9, 1904. Serial No. 197,333.

Claim.—1. A measuring device for lumber-sawing machines including a linear numerator having an operating-shaft, a vertically-self-adjusting linear disk engaging the log or like material to be sawed, a ratchet-shaft, gears connecting the operating-shaft of said numerator with said ratchet-shaft, a ratchet-wheel for said shaft, a pivotally-mounted ratchet-lever having a pawl adapted to engage said ratchet-wheel, a pin-wheel having projecting pins engaging said ratchet-lever and imparting thereto a rocking movement, means whereby rotative motion is transmitted from said linear disk to said pin-wheel, and gravity-acting means engaging the log or like material to be sawed and serving to throw the linear numerator into and out of operation.



4. A measuring device for lumber-sawing machines including a linear numerator having an operating-shaft, a linear disk engaging the log or like material to be sawed, a ratchet-shaft, gears connecting the operating-shaft of said numerator with said ratchet-shaft, a ratchet-wheel for said shaft, a ratchet-lever having a pawl adapted to engage said ratchet-wheel, a pin-wheel having projecting pins engaging said ratchet-lever and imparting thereto a rocking movement, and means whereby rotative motion is transmitted from said linear disk to said pin-wheel.

5. A measuring device for lumber-sawing machines including a linear numerator having an endwise-movable operating-shaft, a vertically-self-adjusting linear disk engaging the log or like material to be sawed, a ratchet-shaft, gears connecting the operating-shaft of said numerator with said ratchet-shaft, a ratchet-wheel for said shaft, a pivotally-mounted ratchet-lever having a pawl adapted to engage said ratchet-wheel, a pin-wheel having projecting pins engaging said ratchet-lever and imparting thereto a rocking movement, a flexible belting whereby rotative movement is transmitted from said linear disk to said pin-wheel, a gravity-acting weighted lever engaging said ratchet-lever and normally holding same in engagement with said pins, a bell-crank lever connected with said operating-shaft, a weighted roller normally engaging the log or like material to be sawed, and means connected with said roller and bell-crank whereby said numerator may be automatically thrown into and out of operation.

6. A measuring device for lumber-sawing machines including a linear numerator having an operating-shaft, a linear disk engaging the log or like material to be sawed, a ratchet-shaft, gears connecting the operating-shaft of said numerator with said ratchet-shaft, a ratchet-wheel for said shaft, a pivotally-mounted ratchet-lever having a pawl adapted to engage said ratchet-wheel, a pin-wheel having projecting pins engaging said ratchet-lever and imparting thereto a rocking movement, means whereby rotative motion is transmitted from said linear disk to said pin-wheel, and gravity-acting means engaging the log or like material to be sawed and serving to throw the linear numerator into and out of operation.

7. A measuring device for lumber-sawing machines including a linear numerator having an operating-shaft, a vertically-self-adjusting linear disk engaging the log or like material to be sawed, a ratchet-shaft, gears connecting the operating-shaft of said numerator with said ratchet-shaft, a ratchet-wheel for said shaft, a pivotally-mounted ratchet-lever having a pawl adapted to engage said ratchet-wheel, a pin-wheel having projecting pins engaging said ratchet-lever and imparting thereto a rocking movement, a flexible belting whereby rotative movement is transmitted from said linear disk to said pin-wheel, means whereby said ratchet-lever is held in engagement with said pins, and gravity-acting means engaging the log or like material to be sawed and serving to throw the linear numerator into and out of operation.

8. A measuring device for lumber-sawing machines including a linear numerator having an operating-shaft, a linear disk engaging the log or like material to be sawed, a ratchet-shaft, gears connecting the operating-shaft of said numerator with said ratchet-shaft, a

ratchet-wheel for said shaft, a ratchet-lever having a pawl adapted to engage said ratchet-wheel, a pin-wheel having projecting pins engaging said ratchet-lever and imparting thereto a rocking movement, means whereby rotative motion is transmitted from said linear disk to said pin-wheel, and gravity-acting means engaging the log or like material to be sawed and serving to throw the linear numerator into and out of operation.

9. A measuring device for lumber-sawing machines including a linear numerator, a linear disk engaging the log or like material to be sawed, a rotating element operated by said linear disk, means whereby said rotating element intermittently operates said numerator, and gravity-acting means engaging the log or like material to be sawed and serving to throw the linear numerator into and out of operation.

10. A measuring device for lumber-sawing machines including a linear numerator, a linear disk engaging the log or like material to be sawed, a rotating element operated by said linear disk, means whereby motion is imparted to said numerator by said rotating element, and gravity-acting means engaging the log or like material to be sawed and serving to throw the linear numerator into and out of operation.

11. A measuring device for lumber-sawing machines including a linear numerator, means mechanically connected with said numerator and frictionally engaging the log or like material to be sawed whereby the linear contents of the same may be indicated by said numerator, and gravity-acting means engaging the log or like material to be sawed and serving to throw the linear numerator into and out of operation.

12. A measuring device for lumber-sawing machines including a linear numerator, a linear disk engaging the log or material to be sawed, a pin-wheel operated by said linear disk, said pin-wheel having projecting pins, a rocking member having oppositely-extending arms one of said arms engaging said pins, an adjustable stop engaged by the other of said arms, a frictional dog carried by the pin-engaging arm, a transmitting-wheel intermittently engaged with and rotated by said dog, a cubic numerator having an operating-shaft, gears whereby rotary motion is transmitted by said transmitting-wheel to said numerator, braking means serving to prevent movement of said numerator-shaft when engagement of the dog and transmitting-wheel is released, a cubic disk normally engaging the log or material to be sawed and adjustably mounted in a vertically-disposed slot, a rack-bar for said cubic disk, a pinion meshing with said rack-bar, a segment carrying said adjustable stop, an indicating-pointer carried by said segment, a graduated scale for said pointer, and means whereby rotary motion is transmitted from said bar-engaging pinion to said segment thereby serving to vary the movement of said rocking member.

13. A measuring device for lumber-sawing machines including a linear numerator, a linear disk engaging the log or material to be sawed, a pin-wheel rotated by said linear disk, said pin-wheel having projecting pins, a rocking member having oppositely-extending arms one of said arms engaging said pins, an adjustable stop engaged by the other of said arms, a frictional dog carried by the pin-engaging arm, a transmitting-wheel intermittently engaged with and rotated by said dog, a cubic numerator having an operating-shaft, gears whereby rotary motion is transmitted by said transmitting-wheel to said numerator, braking means serving to prevent movement of said numerator-shaft when engagement of the dog and transmitting-wheel is released, a cubic disk normally engaging the log or material to be sawed and adjustably mounted in a vertically-disposed slot, a rack-bar for said cubic disk, a pinion meshing with said rack-bar, a segment carrying said adjustable stop, an indicating-pointer carried by said segment, a graduated scale for said pointer, means whereby rotary motion is transmitted from said bar-engaging pinion to said segment thereby serving to vary the movement of said rocking member, a bell-crank connected with the operating-shaft of said cubic numerator, and a weighted roller engaging the log or like material to be sawed and connected with said bell-crank whereby the numerator may be thrown into and out of operation.

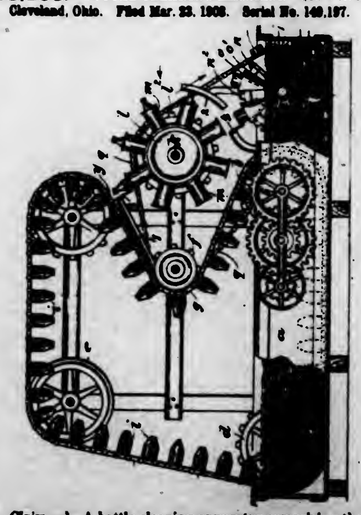
14. A measuring device for lumber-sawing machines including a rocking member, means for operating said rocking member, an adjustable stop adapted to engage said rocking member, a frictional dog carried by said member, a transmitting-wheel intermittently engaged with and rotated by said dog, a cubic numerator having an operating-shaft, gears whereby rotary motion is transmitted by said transmitting-wheel to said numerator, braking means serving to prevent movement of said numerator when engagement of the dog and transmitting-wheel is released, a cubic disk normally engaging the log or material to be sawed and adjustably mounted in a vertically-disposed slot, a rack-bar for said cubic disk, a pinion meshing with said rack-bar, a segment carrying said adjustable stop, an indicating-pointer carried by said segment, a graduated scale for said pointer, and means whereby rotary motion is transmitted from said bar-engaging pinion to said segment thereby serving to vary the movement of said rocking member.

15. A measuring device for lumber-sawing machines including a rocking member, means for operating said rocking member, an adjustable stop adapted to engage said rocking member, a frictional dog carried by said member, a transmitting-wheel intermittently engaged with and rotated by said dog, a cubic numerator having an operating-shaft, gears whereby rotary motion is transmitted by said transmitting-wheel to said numerator, braking means serving to prevent movement of said numerator when engagement of the dog and transmitting-wheel is released, a cubic disk normally engaging the log or material to be sawed, a segment carrying said adjustable stop, an indicating-pointer carried by said segment, a graduated scale for said pointer, and means whereby said cubic disk serves to operate said segment thereby serving to vary the movement of said rocking member.

16. A measuring device for lumber-sawing machines including a rocking member, means for operating said rocking member, a stop adapted to engage said rocking member, a frictional dog carried by said member, a transmitting-wheel intermittently engaged with and rotated by said dog, a cubic numerator having an operating-shaft, gears whereby rotary motion is transmitted by said transmitting-wheel to said numerator, braking means serving to prevent movement of said numerator when engagement of the dog and transmitting-wheel is released, a vertically-movable cubic disk normally engaging the log or material to be sawed, a segment carrying an adjustable stop, means whereby vertical movement of said cubic disk is transmitted to said segment, serving to vary movement of said rocking member, an indicating-pointer carried by said segment, and a graduated scale for said pointer.

17. In combination a linear numerator for sawing-machines, driving means engaging the material sawed for operating said numerator, a cubic numerator, intermediate mechanism operatively connecting said cubic numerator and driving means, and devices engaging the material sawed and said intermediate mechanism for varying the operation of said cubic numerator with respect to said linear numerator.

813,100. BOTTLE-CLEANING MACHINE. CHARLES H. LOEW, Cleveland, Ohio. Filed Mar. 23, 1903. Serial No. 149,197.



Claim.—1. A bottle-cleaning apparatus comprising the following instrumentalities: a bottle-soaking means having a conveyer which carries the bottles being soaked; a bottle-rinsing means comprising a series of bottle-receptacles and means for admitting the rinsing liquid to the interior of the bottles in said receptacles; and a series of moving receptacles arranged intermediate of the discharge-piece of said conveyer and the first-mentioned receptacles and adapt-

ed to receive the bottles from said conveyer and deliver the same to the receptacles of the rinsing means.

the soaked bottles to said receptacles, and a bottle-rinsing means comprising a revolvable series of receptacles for receiving the bottles

21. A bottle-rinsing means, comprising a rotatable bottle-carrier, a rinsing-stem partaking of the rotating movement of said carrier and means for advancing and retracting said rinsing-stem to-

by the rotation of said hub on the latter, means for carrying the bottles through said tank and conducting the same to said cups and

ed to receive the bottles from said conveyor and deliver the same to the receptacles of the rinsing means.

2. A bottle-cleansing apparatus comprising the following instrumentalities: a bottle-soaking mechanism provided with bottle-conveying means; a movable rinsing mechanism having bottle-carriers; and a movable reversing means having bottle-receptacles which in one position of the movement of said means receive the bottles from said conveying means and in another position thereof deliver the same to said rinsing mechanism.

3. A bottle-cleansing apparatus comprising the following instrumentalities: a bottle-soaking mechanism provided with an endless carrier having open pockets which receive the bottles in one place in the travel thereof and automatically discharge the same at another place in said travel; a movable reversing means having bottle-pockets which at one place in its travel receive the bottles discharged from said carrier and automatically discharge the same at another place in its travel; and a movable rinsing mechanism having bottle-carriers which receive the bottles discharged from said reversing means.

4. A bottle-cleansing apparatus comprising the following instrumentalities: a bottle-soaking mechanism provided with bottle-conveying means; a rotative bottle-rinsing mechanism having a series of bottle-receptacles and means controlled by the rotation of said mechanism for supplying water to the interior of the bottles in said receptacles; and means for delivering the bottles from the bottle-conveying means to the receptacles of the bottle-rinsing means.

5. A bottle-cleaning apparatus comprising the following instrumentalities: a bottle-soaking mechanism provided with bottle-conveying means; a rinsing mechanism, comprising a traveling bottle-carrier, fluid-discharge stems partaking of the movement of said carrier and also movable toward and from the bottles in said carrier, said stems having means subject to the pressure of the rinsing liquid, whereby they are moved relatively to said bottles, means by which the supply of said rinsing liquid is controlled by the movement of said carrier, and means for operating said stems in a direction opposite that in which they are adjusted by said liquid; and means for delivering the bottles to the rinsing means from the soaking means.

6. A bottle-cleaning apparatus, comprising the following instrumentalities: a bottle-soaking mechanism provided with bottle conveying and discharging means; a rotative rinsing mechanism comprising a bottle-carrier provided with fluid-discharge stems which are moved toward and from the bottles in said carrier automatically under the control of the pressure of the rinsing fluid, said carrier also having means by which said pressure is controlled by the rotation of the carrier; and bottle-reversing means arranged intermediate of said conveyor and carrier for delivering to the latter the bottles discharged from the former.

7. A bottle-cleaning apparatus, comprising the following instrumentalities: a bottle-soaking mechanism provided with bottle conveying and discharging means; a rotative rinsing mechanism comprising a bottle-carrier provided with fluid-discharge stems having means subject to the pressure of the rinsing liquid whereby they are moved relatively to the bottles, means by which the supply of said rinsing liquid is controlled by the rotation of said carrier and means for moving said stems in a direction opposite that in which they are moved by said liquid-pressure; and bottle-reversing means arranged intermediate of said carrier and conveyor for delivering to said carrier the bottles discharged from said conveyor.

8. A bottle soaking and rinsing machine comprising a tank for a soaking solution, means for carrying the bottles therethrough and for discharging the bottles when the same have been soaked, a traveling rinsing means comprising bottle-carriers and means for automatically controlling the supply of rinsing fluid, and means for automatically delivering the soaked bottles from the first-mentioned bottle-carrying means to the carrier of the rinsing means.

9. A bottle-cleaning machine comprising a series of bottle-receptacles adapted automatically to discharge the bottles at a predetermined place, a bottle-soaking means having devices for conveying the soaked bottles to said receptacles, and a bottle-rinsing means, comprising a revoluble series of receptacles for receiving the bottles from the first-mentioned receptacles, a stationary liquid-supply pipe having a horizontal slot for the escape of its liquid, a series of tubes movable with said receptacles and into which the liquid from said supply-pipe enters as they successively pass over said slot; pistons in said tubes having openings and provided with hollow fluid-discharge stems, and retracting means for said pistons and stems.

10. A bottle-cleaning machine comprising a series of bottle-receptacles adapted automatically to discharge the bottles at a predetermined place, a bottle-soaking means having devices for conveying the soaked bottles to said receptacles, and a bottle-rinsing means comprising a revoluble series of receptacles for receiving the bottles from the first-mentioned receptacles, a stationary liquid-supply pipe having a horizontal slot for the escape of the liquid, a series of tubes carrying said receptacles and provided with vent-openings, and having open inner ends bearing upon said supply-pipe, a plug at the opposite end of each tube, pistons in said tubes having openings and provided with hollow fluid-discharge stems which extend through said plugs, and retracting-springs for said pistons and stems.

11. A machine of the class described, comprising a bottle-carrier, a wheel having means for receiving the bottles and means through which liquid under pressure is ejected against the bottles, and a bottle transferring and reversing wheel arranged intermediate of said carrier and wheel and adapted to transfer the bottles from the carrier to said wheel.

12. A machine of the class described, comprising a bottle-carrying mechanism, a wheel having means for engaging the bottles and means through which liquid under pressure is ejected against the bottles, said carrying mechanism being adapted to discharge the bottles at a place which is higher than said wheel, a bottle transferring and reversing mechanism arranged between said discharge-place and wheel and adapted to receive the bottles from said carrying mechanism and to discharge them at a place which is higher than said wheel, and guards controlling the discharge of said bottles from said carrying and transferring and reversing mechanisms.

13. A machine of the class described, comprising a flexible bottle-carrier having pockets which open downward at one place in the travel thereof and are adapted to discharge the bottles at said place, a bottle reversing and transferring wheel which receives the bottles at said place, a wheel having means to engage the bottles and means through which fluid under pressure is ejected against the bottles, and a guard arranged between said wheels and controlling the passage of the bottles from the former and guiding them to the latter.

14. A machine of the class described comprising a bottle-soaking means having a conveyor which travels a path whereby the bottles are inverted and emptied and means whereby the bottles are retained in said conveyor until after they have been emptied, a rinsing-wheel having bottle-engaging devices, and a bottle transferring and reversing wheel arranged between said conveyor and rinsing-wheel and adapted to receive the soaked bottles from the former, reverse them and deliver them to the rinsing-wheel.

15. A bottle soaking and rinsing apparatus, comprising, in combination, bottle-soaking means, a bottle-rinsing means which comprises a series of traveling receptacles for the soaked bottles and means for ejecting rinsing fluid under pressure against the bottles in said receptacles, and means by which the soaked bottles are conducted automatically from the soaking means to the rinsing means.

16. A bottle soaking and rinsing apparatus, comprising, in combination, bottle-soaking means, a bottle-rinsing means which comprises a series of traveling receptacles for the soaked bottles and is provided with reciprocatory discharge-stems and devices adapted to cause the reciprocations of said stems to occur automatically, and means by which the soaked bottles are conducted automatically from the soaking means to the rinsing means.

17. A bottle soaking and rinsing apparatus comprising, in combination, means for soaking the bottles; a bottle-rinsing means which comprises a series of traveling receptacles for the soaked bottles, fluid-discharge stems having heads subject to the pressure of the rinsing fluid whereby they are advanced into the bottles, means for supplying said heads and the interiors of the stems with rinsing fluid under pressure at a predetermined place in the travel of the parts, and means for retracting said stems and head when the supply of rinsing fluid is cut off; and means by which the soaked bottles are conducted automatically from the soaking means to the rinsing means.

18. A traveling bottle carrying and rinsing means having fluid-discharge devices which are advanced toward the bottles by the pressure of the rinsing fluid, means by which the supply of said fluid is automatically controlled by the movement of the bottle-carrying means, and means for retracting said discharge devices automatically when the supply of rinsing fluid is cut off.

19. A bottle-rinsing means comprising devices for holding the bottles, reciprocatory fluid-discharge stems and means whereby the reciprocations of said stems toward and from the bottles are controlled by the pressure of the rinsing fluid.

20. A bottle-rinsing means comprising traveling devices for holding the bottles, fluid-discharge stems, and means controlled by the pressure of the rinsing fluid for advancing and retracting said stems toward and from the bottles at predetermined places in the travel of the bottle-holding devices.

21. A bottle-rinsing means, comprising a rotatable bottle-carrier, a rinsing-stem partaking of the rotating movement of said carrier and means for advancing and retracting said rinsing-stem toward and from the bottle at predetermined places in the travel of said carrier.

22. A bottle-rinsing means, having a rotative wheel provided with reciprocatory fluid-discharge stems and devices by which the reciprocations of said stems are controlled by the pressure of the rinsing fluid, said rinsing means also having means by which said pressure is controlled automatically by the movement of said wheel.

23. A bottle-rinsing wheel comprising means for receiving the bottles and means for introducing into the interior of the bottles jets of water, comprising a hollow hub supplied with water under pressure, fluid-discharge means radiating therefrom and communicating therewith, said fluid-discharge means having reciprocatory discharge-stems and devices by which said stems are projected into and withdrawn from the bottles.

24. A bottle-rinsing wheel comprising means for receiving the bottles, and means for introducing into the interior of the bottles jets of water, comprising a hollow hub supplied with water under pressure, fluid-discharge stems radiating therefrom and communicating therewith, pistons adapted to be forced forward by the pressure of the water for projecting the stems into the bottles and means for pushing the stems and pistons into place after use.

25. A bottle-rinsing wheel having means for receiving the necks of the bottles, and also having reciprocatory fluid-discharge stems and devices whereby the reciprocations of said stems are controlled by the movement of the wheel.

26. A bottle-rinsing wheel comprising means for receiving the bottles, fluid-discharge stems movable with said wheel and provided with heads, means controlled by the movement of the wheel for supplying rinsing fluid under pressure to said heads and the interiors of said stems, to thereby advance the same and introduce jets of water into the bottles, and means by which the heads and stems are retracted.

27. A bottle-rinsing wheel comprising means for receiving the bottles, fluid-discharge stems movable with said wheel and provided with heads, means controlled by the movement of the wheel for supplying rinsing fluid under pressure to said heads and the interiors of said stems, to thereby advance the same and introduce jets of water into the bottles, and springs for retracting said pistons and stems when the supply of said water ceases.

28. A bottle-rinsing wheel comprising means for receiving the bottles, hollow carriers for said means, hollow fluid-discharge stems mounted to reciprocate in said carriers and provided with heads having an opening to adapt the interiors of the stems to receive rinsing fluid, a pipe around which said wheel rotates, said pipe having a discharge-aperture with which the interiors of the hollow carriers successively register, and means for supplying said pipe with rinsing fluid under pressure.

29. A bottle-rinsing wheel comprising open pockets for receiving the bottles neck downward, hollow carriers for said pockets, hollow fluid-discharge stems mounted to reciprocate in said carriers and provided with heads having openings to adapt the interiors of the stems to receive rinsing fluid, a supply-pipe around which said wheel rotates, said pipe having a discharge-aperture with which the interiors of the hollow carriers successively register, and means for supplying said pipe with rinsing fluid under pressure.

30. A bottle-rinsing wheel comprising means for receiving the bottles, hollow carriers for said means, spring-pressed hollow fluid-discharge stems mounted to reciprocate in said carriers and provided with heads having openings to adapt the interiors of the stems to receive rinsing fluid, a supply-pipe around which said wheel rotates, said pipe having a discharge-aperture with which the interiors of the hollow carriers successively register, and means for supplying said pipe with rinsing fluid under pressure.

31. A bottle-rinsing means comprising a fluid-discharge pipe having an exit-aperture, a hub mounted to rotate on said pipe, and hollow stems radiating from said hub and having bottle-engaging cups at their outer ends, said stems having inlet-apertures at their inner ends and being successively brought into and out of registration with said exit-aperture of the supply-pipe by the rotation of said hub on the latter.

32. A bottle-cleaning apparatus comprising a washing-tank, a rinsing means having a fluid-discharge pipe provided with an exit-aperture and a hub mounted to rotate on said pipe and provided with hollow stems having cups at their outer ends and inlet-apertures at their inner ends, which inlet-apertures are successively carried into and out of registration with said exit-aperture of the discharge-pipe by the rotation of said hub on the latter, means for carrying the bottles through said tank and conducting the same to said cups and means for moving the parts in unison with each other.

33. A bottle-cleaning apparatus, comprising a washing-tank, means for ejecting rinsing fluid against the washed bottles, means for conveying the bottles through said washing-tank, said means being adapted to discharge the bottles at a predetermined place, and bottle transferring and reversing means traveling with said conveyer and receiving the bottles discharged by the latter and conducting the same to the rinsing means and discharging them in reverse position.

34. A bottle-cleaning apparatus, comprising a washing-tank, means for ejecting rinsing fluid against the washed bottles, means for conveying the bottles through said washing-tank, said means being adapted to discharge the bottles at a predetermined place, a rotatable bottle transferring and reversing wheel mounted between said discharge-place and rinsing means and provided with pockets to receive the bottles discharged from said conveyer, and means for rotating said wheel in unison with the travel of said conveyer.

35. A bottle-cleaning apparatus, comprising a washing-tank, means for conveying the bottles through said washing-tank, a rinsing means having a fluid-discharge pipe provided with an exit-aperture, and a hub mounted to rotate on said pipe and provided with hollow stems having cups at their outer ends and inlet-apertures at their inner ends, which inlet-apertures are successively carried into and out of registration with said exit-aperture of the discharge-pipe by the rotation of said hub agound the latter, means for conveying the bottles through said tank, adapted to discharge the same at a predetermined place, and bottle transferring and reversing means traveling with said conveyer and rinsing means for receiving the bottles discharged by the conveyer and delivering the same to the rinsing means.

36. A bottle-cleaning apparatus having a tank and means for subjecting the bottles successively to a plurality of cleaning operations, the first of said means comprising an endless flexible conveyer which travels within said tank and also outside of the same and through a path which causes the bottles to be emptied before they reach the second cleaning means, and a rotatable bottle-transferring device which is arranged entirely outside of said tank and between said conveyer and second cleaning means and is adapted to receive the bottles from the former, invert them and deliver them to said second cleaning means.

37. A bottle-cleaning apparatus having a tank and means therein for subjecting the bottles successively to a plurality of cleaning operations, the first of said means comprising an endless flexible conveyer which travels within said tank and also outside of the same and through a path which causes the bottles to be emptied before they reach the second cleaning means, and the second of said means comprising a rotatable rinsing-wheel, and a rotatable bottle-transferring device which is arranged entirely outside of said tank and between said conveyer and rinsing-wheel and is adapted to receive the bottles from the conveyer, invert them and deliver them to said rinsing-wheel.

813,101. CLOSED CONDUIT FOR ELECTRIC RAILWAYS.

AUGUSTUS W. LOHMANN, Sr., Chattanooga, Tenn., and JOHAN PEUS, Chicago, Ill. Filed Mar. 23, 1905. Serial No. 251,265.

Claim.—1. The combination with the conduit opening or slot of shutters, each thereof having sides forming an angle, the sides of which extend from one side of said slot and meet at the opposite side thereof.

2. The combination with the slot-opening to a conduit, of oppositely-disposed shutters, each said shutter having edges which form the sides of an obtuse triangle, the base of which obtuse angle rests at one edge of said opening while the apex of said angle touches the opposite side of said opening.

3. The combination with a conduit opening or slot, of pivotally-mounted shutters the edges of which meet diagonally across said slot

in zigzag order and provide inclines along which the trolley-arm is adapted to move and thereby impart a gradual opening-and-closing movement to said shutters.

4. The combination with a conduit opening or slot, of shutters having inclined meeting edges which cross the slot or opening from side to side in two intersecting vertical planes, the edges of each shutter meeting the intersecting edges of two oppositely-disposed shutters, for the purpose set forth.

5. The combination with a conduit slot or opening, of oppositely-disposed shutters, each shutter extending across the full width of said slot or opening and having oppositely-inclined edges which meet parallel edges of abutting shutters.

6. The combination with a conduit slot or opening, of oppositely-disposed shutters which meet on angular lines crossing said opening, said shutters having pivotal supports within said conduit, means tending to hold said shutters in their closed positions and means for varying the force exerted upon said shutters to hold the same in said closed positions.

7. The combination with an electric conduit, of centrally-arranged supports, curved shutter-arms E, E' mounted to swing in opposite directions upon a common axis of rotation, a feed-wire, a trolley-wire and means for making and breaking electrical connection between said feed-wire and trolley-wire by, respectively, the opening-and-closing movements of said shutter-arms.

8. The combination with a conduit having a slot or opening, of shutters arranged to swing in the arc of a circle toward and from each other, all of said shutters having substantially a common axis of rotation and having only their side edges projecting into said opening, the abutting ends of said shutters meeting diagonally across said opening when closed.

9. The combination with a conduit having an opening for the trolley pole or arm, of shutters arranged to swing in arcs of circles toward and from each other, said circles having their centers on a single axial line the abutting ends of said shutters meeting at the sides of said opening, a feed-wire, a trolley-wire mounted to swing with said shutters, and contacts electrically connected with, respectively, said feed-wire and trolley-wire, the trolley-wire contact being movable with said wire and shutters.

10. The combination with a conduit having an opening or slot for the trolley-arm, of concentrically-pivoted shutters arranged to swing toward and from each other in the arcs of circles, said shutters mounted on curved levers pivoted within said conduit, each said lever having a counterweight-arm and a counterweight slidably adjustable thereon, a feed-wire, contact-arms upon said levers, and means for making and breaking the circuit through said contact arms and feed-wire by the movements of said levers.

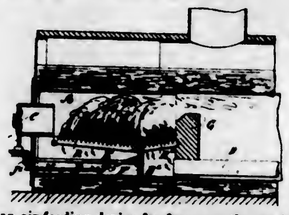
11. The combination with an electric conduit, of centrally-arranged supports D having openings 6 therethrough for the feed-wire, the feed-wire, counterweighted and concentrically pivoted shutter-levers E, E' and I, I', the shutters F, F', having inclined edges *f*, *f'*, mounted on said levers, the insulating-arms 28 secured to levers comprising members E' and I, the bars K also secured to said levers and supporting the trolley-wire 16, the insulating-arms 20 secured to said supports and the contacts 21 and 29 operable by the movements of said levers.

12. The combination with the concentrically-pivoted arms E, E' and shutters F, F' of the radial arms K supporting pivotally the trolley-wire sections 16, the radial arms I, I' adjustably weighted to swing arms E, E' and the shutters thereon, the oscillating contacts which move with said shutters and the stationary contacts connected to the feed-wire, and the trolley-arms H and H' and trolleys arranged as shown and described.

13. The combination with a conduit having the slot G, of the concentrically-pivoted shutters F and F', the curved arms carrying said shutters, the trolley-wire section carried by one series of said arms and movable therewith to place the trolley-wire in line with the trolley when the arm of the latter opens said slot, the weighted arms and the adjustable weights thereupon, the feed-wire, and the connections between said feed-wire and trolley-wire arranged to break the circuit therebetween when said slot is closed.

813,102. AIR-FEEDING DEVICE FOR FURNACES. MAXIMILIAN A. LUTHMER, Berlin, Germany, assignor to Firm of Gesellschaft für Industrielle Feuerungsanlagen M. B. H., Berlin, Germany. Filed Apr. 15, 1903. Serial No. 152,868.

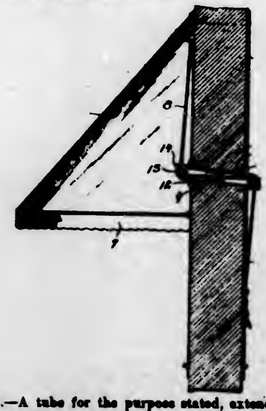
Claim.—1. In an air-feeding device for furnaces, the combination of a wall dividing the ash-box into two compartments and provided with an opening, a tube for leading heated and compressed air into the rear one of said compartments, the area of said tube being larger than the area of the opening in the wall, and means for moistening the air, introduced through the opening of the wall, in the forward compartment, substantially as described.



2. In an air-feeding device for furnaces, the combination of a wall dividing the ash-box into two compartments and provided with an opening, a tube for leading heated and compressed air into the rear one of the said compartments, the area of said tube being larger than the area of the opening in the wall, means for opening or closing the opening in the wall, and means for moistening the air, introduced through the opening of the wall, in the forward compartment, substantially as described.

3. In an air-feeding device for furnaces, the combination of a wall dividing the ash-box into two compartments and provided with an opening, a tube for leading heated and compressed air into the rear one of the said compartments, the area of said tube being larger than the area of the opening in the wall, means for opening or closing the opening in the wall, means for connecting the means for opening or closing the opening in the wall with the fire-door, and means for moistening the air, introduced through the opening of the wall, in the forward compartment, substantially as described.

813,103. AWNING. JOHN MALINOSKEY, Cleveland, Ohio. Filed Nov. 14, 1905. Serial No. 287,361.



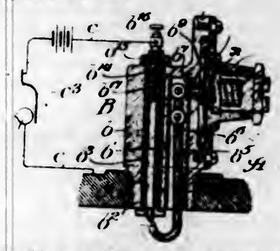
Claim.—A tube for the purpose stated, extending through a wall or window-casing and comprising two telescoping sections which fit together at their inner ends and having ring flanges thereon adapted to be secured to the sides of the wall or casing, and pulleys at their outer ends.

813,104. SPARKING DEVICE. HARRY A. MILLER, Los Angeles, Cal. Filed Jan. 14, 1905. Serial No. 241,894.

Claim.—1. An ignition device, comprising a plug, a spring-held reciprocable contact member, an oscillating contact member, a chamber communicating with the inner end of the plug, and a member contained in said chamber and exposed to the cylinder-pressure and serving to actuate said second-named contact member, for the purpose set forth.

2. An ignition device comprising a plug, an insulating-sleeve extending therethrough, a contact member extending longitudinally through said sleeve, an oscillating lever-form contact member, and a diaphragm located so as to be exposed to cylinder-pressure when in use and serving to actuate said second-named contact member, for the purpose set forth.

3. An ignition device comprising a plug, a contact member having insulated connection with said plug, an oscillating contact member, a diaphragm connected therewith and normally in position to hold said contact members out of engagement, a spring bearing against said diaphragm, and means for adjusting the tension of said spring, for the purpose set forth.

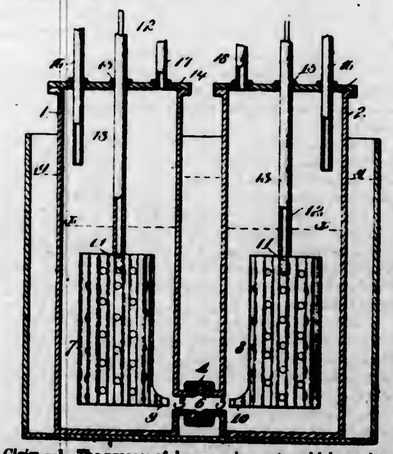


4. The combination with an engine-cylinder, of an ignition device comprising two internal relatively movable contact members, a diaphragm connected with one of said contact members, said contact members being normally separated, an electric circuit which may be completed through said contact members, and a normally open external make-and-break device interposed in said circuit, for the purpose set forth.

5. An ignition device, comprising a plug, an internal contact member connected therewith, a pivoted contact member, a diaphragm disposed at one side of said second-named contact member and connected with the same and exposed to pressure from the cylinder of the engine, and an adjustable spring bearing against said diaphragm, for the purpose set forth.

6. An ignition device, comprising a plug having a bore, an insulating-tube extending therethrough, a tube within said insulating-tube, a reciprocable contact member within said last-named tube, a chamber in said plug, a contact member pivoted in said chamber, a diaphragm disposed at one side of said last-named contact member and connected with said last-named contact member, a spring bearing on said diaphragm, means for adjusting said spring, and means for connecting the conductor of an electric circuit with said second-named tube, for the purpose set forth.

813,105. PROCESS FOR DECOMPOSING WATER BY ELECTROLYSIS. WILLIAM F. M. MCCARTY, Rocky Ridge, Md., assignor to Thomas A. Darby, trustee, New York, N. Y. Filed Nov. 3, 1904. Serial No. 231,940.



Claim.—1. The process of decomposing water which consists in adding to the water an alkali metal and then subjecting the water to the action of an electric current.

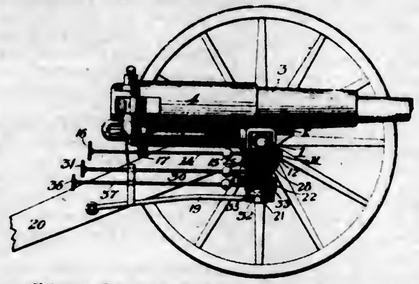
2. The process of decomposing water which consists in acidulating the water, adding thereto an alkali metal, and then subjecting the water to the action of an electric current.

3. The process of decomposing water which consists in adding to the water metallic sodium, and then subjecting the water to the action of an electric current.

4. The process of decomposing water which consists in acidulating the water, adding thereto metallic sodium, and then subjecting the water to the action of an electric current.

5. The process of decomposing water which consists in adding to the water metallic sodium, and at the moment of greatest ebullition subjecting the water to the action of a electric current.

813,106. GUN-CARRIAGE. SAMUEL N. MCCLEAN, Cleveland, Ohio. Filed Oct. 12, 1901. Serial No. 78,479.



Claim.—1. In a gun-carriage, a cradle jointed to the axle to turn in a plane within which the axle lies and in a plane transverse to the axle, and means imparting said movements to the cradle.

2. In a gun-carriage, a cradle connected to the axle by a universal joint around the axle, and means imparting movements to the cradle in a plane within which the axle lies and in a plane transverse to the axle.

3. In a gun-carriage, a cradle in which the gun recoils, a recoil-check on the cradle, a universal joint around the axle and connecting the cradle thereto, and means imparting movements to the cradle in a plane within which the axle lies and in a plane transverse to the axle.

4. In a gun-carriage, a cradle in which the gun recoils, a recoil-cylinder on the cradle, a piston in the cylinder connected to the gun, a universal joint around the axle and connecting the cradle thereto, and means imparting movements to the cradle in a plane within which the axle lies and in a plane transverse to the axle.

5. In a gun-carriage, a cradle jointed to the axle to move in a plane within which the axle lies and in a plane transverse thereto, means imparting said movements to the cradle, and a locking device securing the cradle in any adjusted position.

6. In a gun-carriage, a cradle connected to the axle by a universal joint around the axle, means imparting movements to the cradle in a plane within which the axle lies and in a plane transverse to the axle, and a device locking the cradle in any adjusted position.

7. In a gun-carriage, a cradle in which the gun recoils, a recoil-check on the cradle, a universal joint around the axle and connecting the cradle thereto, means imparting movements to the cradle in a plane within which the axle lies and in a plane transverse to the axle, and a device locking the cradle in any adjusted position.

8. In a gun-carriage, a cradle jointed to the axle to move in a plane within which the axle lies and in a plane transverse to the axle, and worm-gearing imparting said movements to the cradle.

9. In a gun-carriage, a cradle jointed to the axle to turn in a plane within which the axle lies, a segmental worm-rack on the cradle, and a worm turning in bearings attached to the axle and engaging said rack to impart said movement to the cradle.

10. In a gun-carriage a cradle jointed to the axle to turn in a plane within which the axle lies, a segmental worm-rack on the cradle, a worm turning in bearings attached to the axle and engaging said rack to impart said movement to the cradle, and a locking device securing the cradle in any adjusted position.

11. In a gun-carriage, a cradle hung to turn around the axle of the carriage as an axis, a segmental worm-rack depending from the cradle below the axle, a worm engaging said rack and turning in bearings attached to the axle and means turning the cradle, in a plane within which the axle lies.

13. In a gun-carriage, a cradle hung to turn around the axle of the carriage as an axle and also in a plane within which the axle of the carriage lies, a segmental worm-rack depending from the cradle

in a substantially vertical plane, a worm turning in bearings attached

in a substantially vertical plane, a worm turning in bearings attached to the axle and engaging said rack, a second segmental worm-rack on the cradle in a substantially horizontal plane, and a worm hung in bearings turning on the axle, and engaging the said horizontal rack.

13. In a gun-carriage, a cradle hung to the axle by a universal joint, two worm-racks attached to the cradle one of which is in a substantially horizontal plane and the other of which is in a substantially vertical plane, a worm engaging the horizontal rack and turning in bearings attached to the axle so as to move in a plane transverse thereto, and a second worm engaging the vertical rack and mounted in bearings turning on a vertical axis.

14. In a gun-carriage, a cradle hung to turn around the axle of the carriage as an axis and also in a plane within which the axle of the carriage lies; a segmental worm-rack depending from the cradle in a substantially vertical plane, a worm turning in bearings attached to the axle and engaging said rack, a second segmental worm-rack on the cradle in a substantially horizontal plane, a worm hung in bearings turning on the axle, and engaging the said horizontal rack and a locking device securing the cradle in any adjusted position.

15. In a gun-carriage, a cradle hung to the axle by a universal joint, two worm-racks attached to the cradle one of which is in a substantially horizontal plane and the other of which is in a substantially vertical plane, a worm engaging the horizontal rack and turning in bearings attached to the axle so as to move in a plane transverse thereto, a second worm engaging the vertical rack and mounted in bearings turning on a vertical axis, and a locking device securing the cradle in any adjusted position.

16. In a gun-carriage, a cradle hung to turn on the axle in a substantially vertical plane and to turn on the axle in a substantially horizontal plane, means imparting said movements to the cradle, and a locking-wedge adjustable into position to secure the cradle against movement on the axle.

17. In a gun-carriage, a cradle hung to turn on the axle in a substantially vertical plane and to turn on the axle in a substantially horizontal plane, means imparting said movements to the cradle, a locking-wedge supported by the axle and adjustable into and out of position to secure the cradle against movement on the axle.

18. In a gun-carriage, a cradle hung to turn on the axle in a substantially vertical plane, a depending segmental worm-rack on the cradle, a worm operatively engaging said rack, a bracket depending from the axle, bearings for said worm on said bracket, a wheel engaging the worm-bearings and having a cam or wedge surface engaging a corresponding cam or wedge surface on the bracket, and means for turning said wheel, whereby the cradle is locked in adjusted position.

818,107. CAR-COUPLING. WILLIAM MCCONWAY, Jr., Pittsburg, Pa., assignor to The McConway & Torley Company, Pittsburg, Pa., a Corporation of Pennsylvania. Filed Aug. 3, 1905. Serial No. 272,267.

Claim.—1. In a car-coupler, the combination with a coupler-head, of a plurality of relatively movable members pivotally mounted on said head, each of said members being integral and permanently mounted upon the head and being adapted to form a coupling with a complementary member, and means for locking said pivotally-mounted members in coupled position.

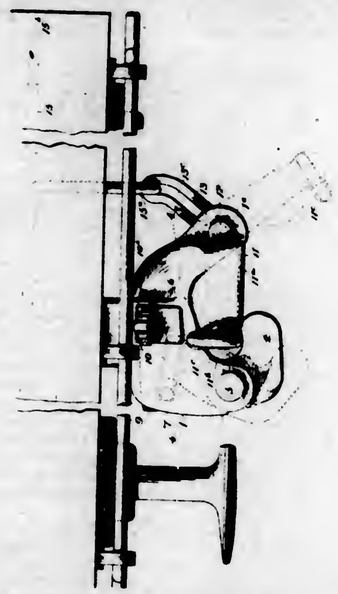
2. In a car-coupler, the combination with a coupler-head, of a plurality of horizontally-movable members pivotally mounted on said head, each of said members being integral and permanently mounted upon the head and being adapted to form a coupling with a complementary member, and means for locking said pivotally-mounted members in coupled position.

3. In a car-coupler, the combination with a coupler-head, of a knuckle pivotally mounted thereon, and horizontally-rotatable means pivotally mounted on said head adapted to engage a link, said means consisting of integral devices permanently mounted on said head.

4. In a car-coupler, the combination with a coupler-head, of a knuckle pivoted thereon, and integral devices pivotally mounted on the guard-arm side of said head adapted to engage a link, said integral devices being horizontally rotatable to coupled and uncoupled positions.

5. In a car-coupler, the combination with a coupler-head, of a knuckle pivoted thereon, a link-engaging member horizontally rotatable to coupled and uncoupled positions, means for locking said link-engaging member in coupled position, and means whereby said link-engaging member may be caused to actuate said knuckle.

6. In a car-coupler, the combination with a coupler-head, of a knuckle, means for locking said knuckle in coupled position, pivotally-mounted link-engaging means adapted to be locked in coupled position by said knuckle and said locking means, and means whereby said link-engaging member may be caused to actuate said knuckle.



7. In a car-coupler, the combination with a coupler-head, of a knuckle, and a link-engaging member adapted to actuate said knuckle.

8. In a car-coupler, the combination with a coupler-head, of a knuckle, and a link-engaging member adapted to open said knuckle.

9. In a car-coupler, the combination with a coupler-head, of a knuckle, and a link-engaging member adapted to close said knuckle.

10. In a car-coupler, the combination with a coupler-head, of a knuckle, and a link-engaging member adapted to both open and close said knuckle.

11. In a car-coupler, the combination with a coupler-head, of a knuckle, a lock for said knuckle, means operated by the lock for opening said knuckle, and a lever system independent of the lock-actuated opening means for opening said knuckle.

12. In a car-coupler, the combination with a coupler-head, of a knuckle, a lock for said knuckle, means independent of the operation of the lock for opening said knuckle, and means for closing said knuckle.

13. In a car-coupler, the combination with a coupler-head, of a pivoted knuckle, a horizontally-rotatable member pivoted on said head, said member being rotatable to coupled and uncoupled positions and being provided with a hook integral therewith, and means for locking said horizontally-rotatable member in coupled position.

14. In a car-coupler, the combination with a coupler-head, of a pivoted knuckle, a lock for said knuckle, a movable member provided with a hook, and means whereby said knuckle and said movable member may be rotated to uncoupled position through the operation of said lock.

15. In a car-coupler, the combination with a coupler-head, of a knuckle, a pivoted link-engaging member, means for locking said link-engaging member in coupled position, and means for causing said link-engaging member to assume both a coupled and an uncoupled position.

16. In a car-coupler, the combination with a coupler-head, of a knuckle, a link-engaging member pivotally mounted on said head, means for locking said knuckle and said link-engaging member in coupled position, means for simultaneously unlocking said knuckle and said link-engaging member, and means for simultaneously rotating said knuckle and said link-engaging member to uncoupled positions.

17. A link-engaging member for a car-coupler provided with a pivoted knuckle, said member having a hook portion and a knuckle-actuating portion adapted to be interposed between the inner face of the outer end of a knuckle and the coupler-head.

18. In a car-coupler, the combination with a coupler-head, of a knuckle, a link-engaging member horizontally rotatable to coupled and uncoupled positions and having a hook portion, and means for simultaneously locking said knuckle and said link-engaging member.

19. In a car-coupler, the combination with a coupler-head, of a knuckle, a link-engaging member pivotally mounted upon the guard-arm side of said head, a member pivotally mounted in the same axis with said link-engaging member, and means for causing a pivotal movement of said last-named member, whereby said link-engaging member is actuated.

20. In a car-coupler, the combination with a coupler-head, of a knuckle, a link-engaging member pivotally mounted upon the guard-arm side of the coupler-head, a member pivotally mounted in the same axis with said link-engaging member, and a hook-coupling-operating member having a pin-and-slot connection with said last-named member.

21. In a car-coupler, the combination with a coupler-head, of a knuckle, a lock for said knuckle, a link-engaging member pivotally mounted upon said coupler-head, a lever pivotally mounted upon the coupler-head and having one arm engaging said link-engaging member and another arm engaging a hook-coupling-operating member, and a hook-coupling-operating member.

22. In a car-coupler, the combination with a coupler-head, of a knuckle, a lock for said knuckle, a link-engaging member pivotally mounted upon said coupler-head, a pivotally-mounted lever having a cam-slot, and a hook-coupling-operating member engaging the cam-slot of said lever.

23. In a car-coupler, the combination with a coupler-head, of a knuckle, a lock for said knuckle, a link-engaging member, and a telescoping connection adapted to attach said lock to an uncoupling-lever.

24. In a car-coupler, the combination with a coupler-head, of a knuckle, a lock for said knuckle, a link-engaging member adapted to close said knuckle, and means independent of the said link-engaging member for opening said knuckle.

25. In a car-coupler, the combination with a coupler-head, of a knuckle, a lock for said knuckle, a link-engaging member adapted to both open and close said knuckle, and means independent of said link-engaging member for opening said knuckle.

26. In a car-coupler, the combination with a coupler-head, of a knuckle, a lock for said knuckle, and means for opening said knuckle, the said knuckle-opening means being unaffected by the closing of said knuckle.

27. In a car-coupler, the combination with a coupler-head, of a knuckle, a link-engaging member pivotally mounted on said head, means for locking said link-engaging member, and means for maintaining said locking means in unlocked position whereby said link-engaging member may be subsequently brought to uncoupled position.

28. In a car-coupler, the combination with a coupler-head, of a knuckle, a lock for said knuckle, a link-engaging member pivotally mounted on said head, and means whereby said link-engaging member may be actuated from both sides of the car.

29. In a car-coupler, the combination with a coupler-head, of a knuckle, a pivotally-mounted link-engaging member having a columnar portion and a hook extending vertically upward therefrom, means for simultaneously locking said knuckle and said link-engaging member in coupled positions, and means for simultaneously opening said knuckle and said link-engaging members.

30. In a car-coupler, the combination with a coupler-head, of a knuckle, an integral link-engaging member pivotally mounted on said head, and means whereby said link-engaging member may be locked in coupled position while said knuckle is in coupled position, said link-engaging member being rotatable horizontally to permit the knuckle to engage a corresponding knuckle.

31. In a car-coupler, the combination with a coupler-head, of a knuckle, a lock for said knuckle, and a member pivotally mounted independent of the knuckle and adapted to both open and close said knuckle.

32. In a car-coupler, the combination with a coupler-head, of a knuckle, and a pivotally-mounted link-engaging member adapted to actuate said knuckle.

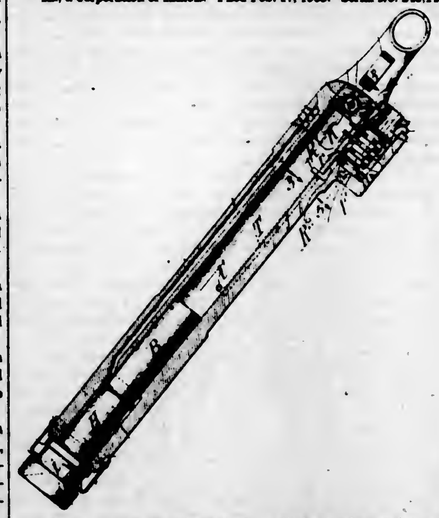
33. In a car-coupler, the combination with a coupler-head, of a knuckle, a lock for said knuckle, and a link-engaging member having a hook portion integral therewith, said link-engaging member being adapted to be engaged and locked in coupled position by the said knuckle and to be actuated by said knuckle.

818,108. PENCIL-TIP. FRANK MEISTER, New York, N. Y., assignor to Eagle Pencil Company, New York, N. Y. Filed Dec. 16, 1905. Serial No. 292,022.

Claim.—1. In a metallic tip for lead-pencils, a barrel provided with a circumferential knurl, a knurled retaining-ring fitting upon the barrel, and a band also fitting upon the barrel and held thereon between the knurl on the barrel and retaining-ring respectively, substantially as set forth.

2. A metallic tip for lead-pencils consisting of a barrel having at a point between its ends a circumferential knurl or shoulder, a knurled thimble fitted upon and secured to the forward portion of the barrel, and a ring or band also fitted upon the barrel, and held between the knurls on the barrel and thimble respectively.

818,109. PNEUMATIC HAMMER. REINHOLD A. NOELLING, Aurora, Ill., assignor to Aurora Automatic Machinery Company, Aurora, Ill., a Corporation of Illinois. Filed Feb. 17, 1905. Serial No. 246,146.



Claim.—1. The combination of a cylinder having an integral handle on its inner end and a bore which extends through its said inner end, a plunger in said cylinder, a controlling-valve casing integral with and extending laterally from the inner end of the cylinder and having a bore which is closed at one end by the integral, outer end wall of the casing and opens at its other end through the inner end of the casing, a valve-piston in the said valve-casing having its central axis parallel with the cylinder, and separate closures for the inner end of the bore of the cylinder and for the bore of the valve-casing.

2. The combination of a cylinder having an integral handle on its inner end, and a bore which extends through its said inner end, a plug inserted in the inner end of the bore of the cylinder for closing the same, a plunger in said cylinder, a controlling-valve casing integral with and extending laterally from the inner end of the cylinder, and having a bore which is closed at one end by the integral outer end wall of the casing and opens at its other end through the inner end of the casing, a valve-piston in said valve-casing having its central axis parallel with the cylinder, and a removable closure for the valve-casing inserted and secured in the inner end of the bore thereof.

3. The combination with a cylinder and a plunger therein, of a controlling-valve comprising a valve-casing formed by a lateral extension of the inner end of the cylinder, a bushing located within said casing, a valve-piston within said bushing, a disk bearing against one end of the said bushing forming the end wall of the valve-chamber, and means for holding the said disk in contact with the said bushing, embracing a split thimble having screw-threaded engagement with the valve-casing and bearing on the said disk, a sleeve

having a conical surface engaging the conical surface of said thimble and a nut having screw-threaded engagement with said sleeve.

4. The combination with a cylinder and a plunger therein, of a controlling-valve comprising a valve-chamber which is interiorly cylindric throughout the greater part of its length and provided at one end with a part of smaller diameter, and an endwise-reciprocating valve-piston provided at one end with a part of smaller diameter fitting the smaller end of said valve-chamber, said larger part of the valve-chamber being provided with an air-supply port and an admission-port for the inner end of the cylinder, laterally in line with each other, with an air-supply port and an admission-port connected with the outer end of the cylinder, also laterally in line with each other, with an exhaust-port for the inner end of the cylinder and a main exhaust-port also laterally in line with each other, and with an exhaust-port for the outer end of the cylinder and a main exhaust-port also laterally in line with each other, said valve-piston being provided with enlarged parts fitting the larger part of the valve-chamber and with intervening grooves, adapted to coöct with said several ports.

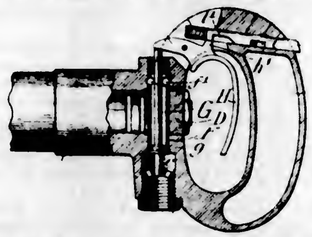
5. The combination with a cylinder and a plunger therein, of a controlling-valve chamber provided with two lateral air-supply ports and two lateral air-admission ports communicating with the inner end of the cylinder, the said air-supply and admission ports being located at corresponding distances from the end of the valve-chamber, and an endwise-sliding valve-piston provided with three enlarged parts and two intervening grooves, spaced to correspond with the distance apart of the air-supply and admission ports, and so arranged that in one position of the piston the two grooves therein will stand opposite and establish communication between the two air-supply and the two admission ports and in the other position of the piston two of the enlarged parts thereof will cover or close said air-supply and admission ports.

6. The combination with a cylinder and a plunger therein, of a controlling-valve comprising a valve-chamber provided with a lateral air-supply port, a lateral air-admission port located laterally in line with the air-supply port and communicating with the inner end of the cylinder, a second air-supply port longitudinally separated from the first-named air-supply port, a lateral air-admission port located laterally in line with the said second supply-port and communicating with the outer end of the cylinder, a lateral air-exhaust port for the outer end of the cylinder, longitudinally separated from the admission-port for the outer end of the cylinder, a lateral exhaust-port for the inner end of the cylinder, longitudinally separated from the exhaust-port for the outer end of the cylinder, a main exhaust-port, laterally in line with both said exhaust-ports for the outer and inner ends of the cylinder, and an endwise-sliding valve-piston having three enlarged parts and two intervening grooves and so arranged that in one position of said piston one of the grooves will connect with each other the first-named air-supply port and the admission-port for the inner end of the cylinder, one of said enlarged parts will cover the second air-supply port and the admission-port for the outer end of the cylinder and another of said enlarged parts will cover the exhaust-port for the inner end of the cylinder, and in the other position of the piston, one of said enlarged parts will cover the first-named air-supply port and the admission-port for the inner end of the cylinder, one of said grooves will connect with each other the second-named air-supply port and the air-admission port for the outer end of the cylinder, the other of said grooves will connect the exhaust-port for the inner end of the cylinder with the exhaust-port, and another of said enlarged parts will cover the exhaust-port for the outer end of the cylinder.

7. The combination with a cylinder and a plunger therein, of a controlling-valve comprising a valve-chamber provided with three lateral air-supply ports, with two lateral ports communicating with admission-ports at the inner end of the cylinder, with a lateral supply and exhaust port communicating with the outer end of the cylinder, with a lateral port communicating with an exhaust-port for the inner end of the cylinder, and with a lateral main exhaust-port leading to the outer air, the valve-piston being provided with four enlarged parts and intervening grooves or recesses, two of said enlarged parts coacting with two of the air-supply ports, and the two admission-ports, a third enlarged portion which coacts with the third air-supply port, and the admission-port for the outer end of the cylinder, and a fourth enlarged portion which coacts with the exhaust-port for the inner end of the cylinder, with the exhaust-port for the outer end of the cylinder and with the main exhaust-port.

8. The combination with a barrel and a plunger therein, of a controlling-valve comprising a valve-chamber having at one end a port of reduced diameter and provided with three lateral air-supply ports, with two lateral ports communicating with admission-ports at the inner end of the cylinder, with a lateral supply and exhaust port communicating with the outer end of the cylinder; with a lateral port communicating with an exhaust-port for the inner end of the cylinder, and with a lateral main exhaust-port leading to the outer air, and a valve-piston having at one end a part of smaller diameter which fits and slides in the smaller end portion of the valve-chamber and is provided with four enlarged parts and intervening grooves or recesses, two of said enlarged parts coacting with two of the air-supply ports and with the two admission-ports, a third enlarged portion which coacts with the third air-supply port, and with the admission-port for the outer end of the cylinder, and a fourth enlarged portion which coacts with the exhaust-port for the inner end of the cylinder, with the exhaust-port for the outer end of the cylinder and with the main exhaust-port, said cylinder being provided with a passage leading from a point near its outer end to the larger end of the valve-chamber, and with a passage leading from the inner end of said cylinder to the smaller end of said valve-chamber.

813,110. **THROTTLE-VALVE.** REINHOLD A. NORLING, Aurora, Ill., assignor to Aurora Automatic Machinery Company, Aurora, Ill., a Corporation of Illinois. Filed May 15, 1905. Serial No. 260,585.



Claim.—1. The combination with a pneumatic-motor cylinder provided with a throttle-valve bore or passage which is open at both ends and with one end of which the air-supply pipe is connected, of a cylindric valve-bushing located in said bore provided at its supply end with a valve-seat and at its opposite end with an axial guide-passage and having an intermediate exit-port, an endwise-sliding valve-stem the outer end of which extends outwardly through the guide-aperture in the bushing and which is provided with a valve-disk adapted to bear against said seat, and a guide-ring for the inner end of said stem located in the supply end of said bore outside of the valve seat and disk.

2. The combination with a pneumatic-motor cylinder provided with a throttle-valve bore or passage which is open at both ends and with one end of which the air-supply pipe is connected, of a cylindric valve-bushing located in said bore provided at its supply end with a valve-seat and at its opposite end with an axial guide-passage and having an intermediate exit-port, an endwise-sliding valve-stem the outer end of which extends outwardly through the guide-aperture of the bushing and which is provided with a valve-disk adapted to bear against said seat, and a nipple inserted in the supply end of said bore outside of the valve seat and disk, said nipple being provided with a guide-ring for the inner end of the valve-stem.

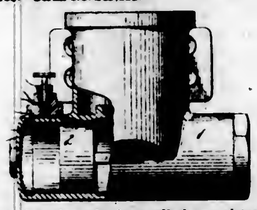
3. The combination with a pneumatic-motor cylinder provided with a throttle-valve bore or passage which is open at both ends and with one end of which the air-supply pipe is connected, of a cylindric valve-bushing located in said bore provided at its supply end with a valve-seat and at its opposite end with an axial guide-passage and having an intermediate exit-port, an endwise-sliding valve-stem the outer end of which extends outwardly through the guide-aperture of the bushing, and which is provided with a valve-disk adapted to bear against said seat, a nipple inserted in the supply end of said bore outside of the valve seat and disk, said nipple being provided with a guide-ring for the inner end of the valve-stem, and a coiled actuating-spring surrounding the said valve-stem between the said guide-ring and the valve-disk.

4. The combination with a pneumatic-motor cylinder and handle thereon, of a throttle-valve embracing an endwise-movable valve-stem, a pivoted trigger having an actuating-arm which extends along the inner face of the handle, said trigger being adapted to act upon said valve-stem, a spring applied to hold the valve normally in its closed position, and a spring-actuated locking-detent for the trigger having a part which projects outwardly from the outer face of the handle at one end of the same.

5. The combination with a pneumatic-tool cylinder and a handle thereon, of a throttle-valve embracing an endwise-movable valve-stem, a pivoted trigger adapted to act upon said valve-stem, and having an actuating-arm which extends along the inner face of the handle, a spring applied to hold the valve normally in its closed position, and a locking-detent for the trigger embracing an endwise-movable spring-actuated locking-bar which protrudes from the outer face of the handle at one end of the same, said trigger being provided with a lug which projects toward said locking-bar, and the locking-bar having a notch or recess adapted to receive said lug to effect the release of the trigger when the bar is pushed inwardly by pressure of the hand thereon.

6. The combination with a cylinder and a plunger therein, of a handle made integral with the inner end of the cylinder, said cylinder being provided with a bore extending through the inner end thereof, a plug inserted in said bore for closing the inner end of the cylinder and throttle-valve embracing a valve-bushing which extends through the said plug and the surrounding part of the cylinder.

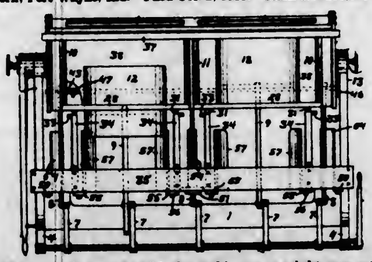
813,111. **DOOR-CHECK.** CHARLES I. PARKER and PAUL PAPENFOTH, New Britain, Conn., assignors to Russell & Erwin Manufacturing Company, New Britain, Conn., a Corporation of Connecticut. Filed Mar. 9, 1905. Serial No. 249,155.



Claim.—1. In a door-check, a cylinder, a piston therein, a by-pass in the wall of said cylinder, a threaded opening intersecting said by-pass the latter entering said opening at one side and leaving the same at the other side, a plug adapted to fill said threaded opening, said opening having an imperforate bottom, one of said parts being grooved to connect the two ends of said by-pass, and a valve carried by said plug and arranged to regulate the size of said groove.

2. In a door-check, a cylinder, a piston therein, a by-pass in the wall of said cylinder, a threaded opening intersecting said by-pass the latter entering said opening at one side and leaving the same at the other side, a plug adapted to fill said threaded opening, said opening having an imperforate bottom, said plug being grooved to connect the two ends of said by-pass and a valve arranged to regulate the size of said groove.

813,112. **CEMENT-BLOCK-MAKING MACHINE.** BRITTON POULSON, Fort Wayne, Ind., assignor of one-half to Frederick Kiemendorff, Fort Wayne, Ind. Filed Oct. 2, 1905. Serial No. 280,875.



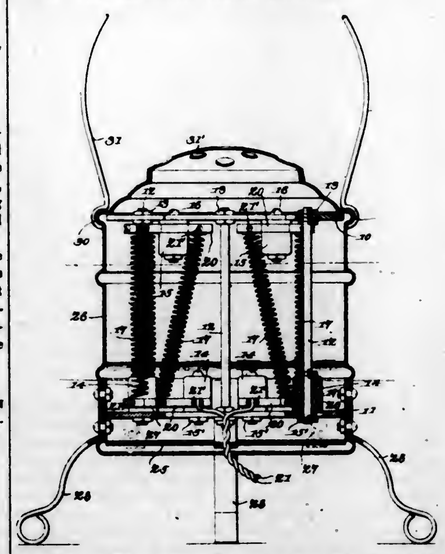
Claim.—1. In a cement-block machine, an upright supporting-frame; a block-mold pivotally mounted on the frame, adapted for a quarter-turn thereon, and having its rear face pivotally mounted and provided with proper core-openings; horizontally-movable cores mounted on the said frame in cooperative relation with the mold; means for withdrawing the end and division plates of the mold simultaneously with the cores by one operation; means for giving the mold a quarter-turn to discharge the block; and means for automatically releasing the pattern and rear plates at each forward turn of the mold.

2. In a cement-block machine an upright supporting-frame; a mold-box pivotally mounted on the said frame adapted for a quarter-turn thereon, having its rear plate pivoted at its lower edge and provided with lateral core-openings, and having its ends vertically slotted to loosely receive the removable pallet; a pivoted vertical adjustable pattern-plate arranged in said mold-box at right angles to the pallet; horizontally-movable end and division plates for the core-box; means for simultaneously withdrawing the end and division plates and the cores from the mold, and for returning the said last-named plates to the mold without moving the withdrawn cores; means for giving the mold a quarter-turn to discharge the block; and means for automatically releasing the pattern and rear plates at each forward turn of the mold.

3. In a cement-block machine a pivotally-mounted mold-box adapted for a quarter-turn having its ends vertically slotted to loosely receive the pallet, and having its rear plate pivotally mounted at its lower edge, and provided with lateral core-openings; a pattern-plate pivotally mounted in the mold-box and adapted for a vertical adjustment therein; means for automatically actuating the said plates upon their pivotal bearings when the mold-box is rotated either forward or backward.

4. In a cement-block machine, a horizontally-movable core having a longitudinally-slotted and rearwardly-projecting connecting-rod and a coöperating pivoted arm whose inner end has a slidable pivoted connection with the slot in said rod, for the purpose specified.

813,113. **ELECTRIC HEATER.** AUSTIN A. PRATT, Los Angeles, Cal. Filed June 21, 1905. Serial No. 266,313.



Claim.—1. In an electric heater, a casing, a pair of supporting members arranged therein, insulating-blocks carried by said members, conducting-clips supported by the blocks, and a plurality of series-connected resistance-coils extending between said clips.

2. In an electric heater, a casing, upper and lower supports disposed therein, insulating-blocks on said supports, metallic clips carried by the insulating-blocks; resistance-coils connected in a continuous series by said clips, and means for connecting the coils to the clips and for clamping the latter in position on the blocks.

3. In an electric heater, a casing, a pair of frame-rings arranged within the casing, connecting-bolts extending between the rings, insulating-blocks held in place on the lower ring by means of said bolts, a series of insulating-blocks secured to the upper ring, the blocks of the respective rings being disposed in staggered relation, current-conducting strips clamped on the blocks, and resistance-coils connected in series by said strips.

4. In an electric heater, a casing, upper and lower frame-rings arranged therein, insulating-blocks carried by the upper and lower rings, the blocks of the respective rings being disposed in staggered relation, each of said blocks having a peripheral groove, strips of

conducting material arranged within the grooves and clamped in place, and resistance-coils connected in a continuous series by said strips.

5. In an electric heater, the combination with a casing, of upper and lower rings, insulating-blocks carried by the rings and provided with grooves, insulating-strips arranged in said grooves, resistance-coils connected in a continuous series by said strips, two of the strips being extended inward over the edge of the lower ring for connection to current-conducting wires.

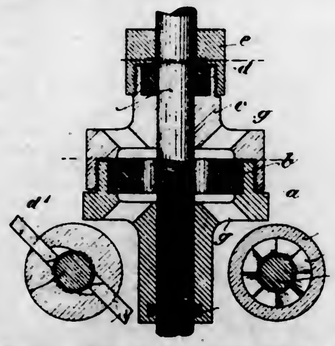
6. In an electric heater, a casing, upper and lower frame-rings arranged therein, connecting-bolts extending between the rings, clips secured to the lower ring, means of securing the casing to the clips, a reticulated disk supported by the clips at a point below the lower ring, and a perforated cover forming the top of the casing.

7. In an electric heater, the combination with upper and lower frame-rings, of a plurality of vertical bolts connecting the rings, insulating-blocks carried by the rings, current-conducting strips supported by the blocks, resistance-coils connected to said strips, a casing surrounding the frame and having a detachable perforated cap to permit the insertion of a vessel within the casing.

8. In a device of the class specified, the combination with a casing, of a pair of superposed and spaced supports, insulators carried thereby, and a plurality of resistance-coils extending between the insulators and arranged in a continuous annular series, forming a central passage for the air to be heated.

818,114. DEVICE FOR CUTTING SCREWS UPON LONG RODS.

PAUL PFEIFER, Berlin, Germany. Filed Mar. 10, 1905. Serial No. 249,481.



Claim.—1. In a device for cutting screws upon long rods, the combination with a sleeve *a* having a narrow portion adapted to be fixed to the rotary chuck of a suitable lathe, and a widened portion adapted to receive the threading-tool, another sleeve attached to said widened portion, and having also a narrow portion, a bore in each of the two narrow portions adapted to receive, to guide, and to keep straight the rod to be threaded, and threading-tools located within the space inclosed by the two widened portions of the sleeves, and secured to the first-mentioned sleeve, substantially and for the purpose as described.

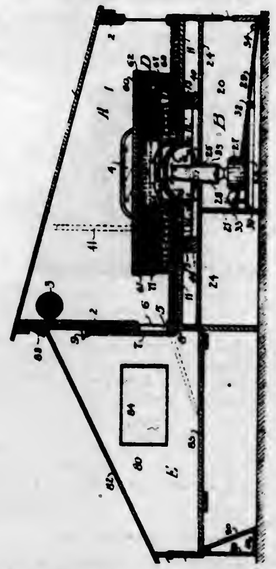
2. In a device for cutting screws upon long rods, the combination with a sleeve *a* having a narrow portion adapted to be fixed to the rotary chuck of a suitable lathe and a widened portion adapted to receive the threading-tool, another sleeve attached to said widened portion, and having also a narrow portion, a bore in each of the two narrow portions adapted to receive, to guide, and to keep straight the rod to be threaded, threading-tools located within the space inclosed by the two widened portions of the sleeves, and secured to the first-mentioned sleeve, a rod-smoothing tool secured to the narrow portion of the other sleeve, and a nut attached to the latter and adapted to hold this tool in place, substantially and for the purpose as described.

3. In a device for cutting screws upon long rods, the combination with a sleeve *a* having a narrow portion adapted to be fixed to the rotary chuck of a suitable lathe, and a widened portion adapted to receive the threading-tool, another sleeve attached to said widened portion, and having also a narrow portion, a bore in each of the two narrow portions adapted to receive, to guide, and to keep straight the rod to be threaded, threading-tools located within the space inclosed by the two widened portions of the sleeves, and secured to the first-mentioned sleeve, and scrapers secured to the outer end of the bore of the latter, substantially and for the purpose as described.

4. In a device for cutting screws upon long rods, the combination with a sleeve *a* having a narrow portion adapted to be fixed to the rotary chuck of a suitable lathe, and a widened portion adapted to receive the threading-tool, another sleeve attached to said widened portion, and having also a narrow portion, a bore in each of the two narrow portions adapted to receive, to guide, and to keep straight the rod to be threaded, threading-tools located within the space inclosed by the two widened portions of the sleeves, and secured to the first-mentioned sleeve, a rod-smoothing tool secured to the narrow portion of the other sleeve, a nut attached to the latter, and adapted to hold this tool in place, and scrapers secured to the outer end of the first sleeve, substantially and for the purpose as described.

818,115. BROODER.

HENRY F. RAU, Tacoma, Wash. Filed Apr. 7, 1904. Serial No. 201,956.



Claim.—1. In a brooder, the combination with a brooding-chamber, of a hover therein, a hover-cloth secured to said hover, a layer of feathers supported by said hover-cloth, a wire screen above said feathers and secured to said hover and adapted to keep said feathers in place, and means for conveying a supply of warm fresh air above said wire screen and to distribute it by said screen over a large surface of said layer of feathers said warm air passing downward through the feathers and the hover-cloth to the space beneath said hover.

2. In a brooder, the combination with a brooding-chamber having a floor, of a hollow cylinder supported vertically by said floor and having one or more rows of holes near its upper end and a lower row of holes therein, a hover-board secured to and supported over the floor by said cylinder, a hover-curtain depending from said hover-board, a hover-cloth secured to said hover-board and to said hollow cylinder below said upper rows of holes therein, and means for conveying a supply of warm fresh air to the inside of the hollow cylinder said warm air passing through the holes therein and downward through said hover-cloth to the space between it and said floor.

3. In a brooder, the combination with a brooding-chamber having a floor, of a hollow cylinder supported vertically by said floor and having one or more rows of holes near its upper end and a lower row of holes therein, a hover-board secured to and supported over said floor by said cylinder, a hover-curtain depending from said hover-board, a hover-cloth secured to said hover-board and to said hollow cylinder between said upper and lower rows of holes therein, and means for conveying a supply of fresh warm air to the inside of said hollow cylinder the warmer part thereof passing through the upper rows of holes therein and downward through said hover-cloth and the cooler part of the air passing through the lower holes directly under said hover-cloth.

4. In a brooder, the combination with a brooding-chamber having a floor, of a hollow cylinder supported vertically by said floor and having one or more rows of holes near its upper end and a lower row of holes therein, a hover-board secured to and supported over said floor by said cylinder, a hover-curtain depending from said hover-board, a hover-cloth secured to said hover-board and to said hollow cylinder between said upper and lower rows of holes therein, a layer of feathers supported by said hover-cloth, a wire screen above said feathers and secured to said hollow cylinder and to said hover-board and adapted to keep said feathers in place, and means for conveying a supply of fresh warm air to the inside of said hollow cylinder the warmer part thereof passing through the upper rows of holes therein and downward through said wire screen said feathers and said hover-cloth and the cooler air passing through the lower row of holes directly under said hover-cloth.

5. In a brooder, the combination with a brooding-chamber having a floor, of a hollow cylinder supported vertically by said floor and having one or more rows of holes near its upper end, and a lower row of holes therein, a hover-board secured to and supported over the floor by said cylinder, a hover-curtain depending from said hover-board, a hover-cloth secured to said hover-board and to said hollow cylinder below said upper row of holes therein, a water vessel supported in said hollow cylinder and having evaporation-holes therein, and means for conveying a supply of warm fresh air to the inside of said hollow cylinder said warm air coming in contact with said water vessel and being charged with moisture therefrom and passing through the holes in said hollow cylinder and downward through said hover-cloth to the space between it and said floor.

6. In a brooder, the combination with a brooding-chamber having a fixed floor with a central hole therein, of a removable floor fitting in said hole in said fixed floor and having a hole therein, of a hollow cylinder supported vertically by said removable floor and surrounding the hole therein and having one or more rows of holes near its upper end, and a lower row of holes therein, a hover-board secured to and supported over the floor by said hollow cylinder, a hover-curtain depending from said hover-board, a hover-cloth secured to said hover-board and to said hollow cylinder below said upper rows of holes therein, and means for conveying a supply of warm fresh air to the inside of said hollow cylinder said warm air passing through the upper holes therein and downward through the hover-cloth to the space between it and said floor the cooler portion thereof passing through the lower holes directly to the under side of the hover-cloth thereby keeping the air under the hover pure.

7. In a brooder, the combination with a brooding-chamber having a fixed floor with a central hole therein, a removable floor fitting in said hole in said fixed floor and having a hole therein, a dome secured in the hole in said removable floor and having a hole in the apex thereof, a hollow cylinder supported vertically by said removable floor and surrounding the hole therein and having one or more rows of holes near its upper end and a lower row of holes therein, a hover-board secured to and supported over the floor by said hollow cylinder, a hover-curtain depending from said hover-board, a hover-cloth secured to said hover-board and to said hollow cylinder below said upper rows of holes therein, a warmed surface within said dome, and pipes leading from the outside of the brooder to the space between said warmed surface and said dome and adapted to conduct fresh air to said warmed surface.

8. In a brooder, the combination with a brooding-chamber having a fixed floor with a central hole therein, a removable floor fitting in said hole in said fixed floor and having a hole therein, a cylindrical sleeve secured in said hole and extending above and below said floor, a dome secured to the lower end of said sleeve and having a hole in the apex thereof said dome extending above and below said floor, a hollow cylinder supported vertically by said floor and surrounding said sleeve and dome and extending upward therefrom and having one or more rows of holes near its upper end and a lower row of holes therein, a hover-board secured to and supported over the floor by said hollow cylinder, a hover-curtain depending from said hover-board, a hover-cloth secured to said hover-board and to said hollow cylinder below said upper rows of holes therein, a warmed surface within said dome, and pipes leading from the outside of the brooder to the space between said warmed surface and said dome and adapted to conduct fresh air to said warmed surface.

9. In a brooder, the combination with a brooding-chamber having a fixed floor with a central hole therein, a removable floor fitting in said hole in said fixed floor and having a hole therein, a cylindrical sleeve secured in said hole and extending above and below said floor, a dome secured to the lower end of the sleeve and having a hole in the apex thereof said dome extending above and below said floor, a water vessel supported over the hole in said dome and having evaporation-holes therein, a hollow cylinder supported vertically by said floor and surrounding said water vessel said sleeve and said dome and extending above said water vessel and having one or more rows of holes near its upper end and a lower row of holes therein, a hover-board secured to and supported over the floor by said hollow cylinder, a hover-curtain depending from said hover-board, a hover-cloth secured to said hover-board and to said hollow cylinder below said upper rows of holes therein, a warmed surface within said dome, and pipes leading from the outside of the brooder to the space between said warmed surface and said dome and adapted to conduct fresh air to said warmed surface.

10. In a brooder, the combination of a lamp-chamber below the center of the brooder, a lamp supported therein independent of the flue, a flue supported over said lamp and extending upward therefrom through a diaphragm and into a dome, a diaphragm secured in said brooder and having small holes therein near its center, a dome secured to the upper side of said diaphragm outside said small holes therein, and having its apex above the upper end of said flue, a smoke-pipe leading from the space below said diaphragm to the outside, an air-pipe leading from the outside to the space above said diaphragm, an outer dome around and above said dome and having a hole in the apex thereof, and a hover supported over and around said domes whereby the fresh warm air from the air-chamber is conveyed to the chickens thereunder.

11. In a brooder, the combination with a hover having a central hollow cylinder with holes therein for warm air to pass to the backs of the chickens thereunder, of means for conveying a supply of fresh warm air free from the products of combustion to said cylinder, and a water vessel supported in the stream of the warm air in said cylinder and adapted to allow the water to evaporate and to charge said warm air with the normal amount of moisture.

12. A brooder-chamber having a floor, the central section thereof being removable and having a hole therein through which a supply of fresh warm air may be conveyed from below said brooding-chamber.

13. In a brooder, the combination with a brooding-chamber having a fixed floor with a central hole therein, of a removable floor fitting in said hole in said fixed floor and having a hole therein, of a cylindrical sleeve secured in said hole and extending above and below said floor, a dome secured to the lower end of said sleeve and having a hole in the apex thereof said dome extending above and below said floor, a hollow cylinder supported vertically by said floor and having one or more rows of holes near its upper end, and a hover supported thereby and consisting of a horizontal board extending out from said cylinder and a hover curtain and cloth supported by said board.

14. In a brooder, the combination with a hover having a central hollow cylinder supported on the hover-floor and having holes therein for warm air to pass to the backs of the chickens thereunder, of a lamp supported centrally below the hover-floor, a diaphragm separating the space below said floor into a smoke-chamber below and a fresh-air chamber above, a closed dome extending into said fresh-air chamber and secured to the upper side of said diaphragm but communicating with said smoke-chamber by small holes through said diaphragm, a flue supported by and passing through said diaphragm over said lamp whereby the smoke and warm air are conveyed from said lamp and collected in said dome whereby the fresh air is warmed and passes into said central hollow cylinder.

818,116. VALVE-GEAR FOR EXPLOSION-ENGINES.

HANS RICHTER, Nuremberg, Germany, assignor to The Firm of Vereinigte Maschinenfabrik Augsburg und Maschinenbaugesellschaft Nurnberg A.-G., Nuremberg, Germany. Filed Aug. 23, 1904. Serial No. 221,868.

Claim.—1. In valve-motions for explosion-engines, the combination, of a passive roller-track *w* actuated by the governor and an active roller-lever *b* working upon said passive roller-track *w* and actuated by the eccentric-rod *e* with a catch *k* loosely mounted on a bolt *p* in the inner end of the active roller-lever *b* and adapted to come in engagement with a cross-piece *u* arranged in the head *v* of the valve-rod and to be brought out of engagement with said cross-piece *u* by a nose *n* fixed on the active roller-lever *b*, substantially as described.

2. In valve-motions for explosion-engines, the combination, of a passive roller-track *w* actuated by the governor and an active roller-lever *b* working upon said passive roller-track *w* and actuated by the eccentric-rod *e*, with a catch *k* loosely mounted on a bolt *p* in

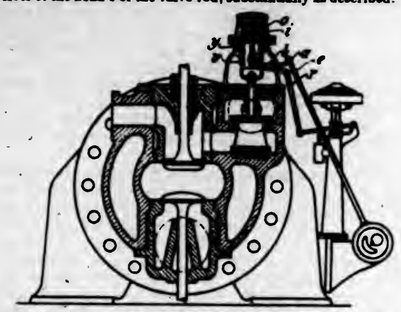
the inner end of the active roller-lever *b* and adapted to come in engagement with a cross-piece *u* arranged in the head *v* of the valve-

5. In a molding-machine, the combination with a mold provided with rotatable sides and ends and a reciprocating core, of

10. In a molding-machine, a mold consisting of pivotally-movable wing-plates and an apertured bottom or tray, said support pre-

said support, a mold-bottom loosely mounted on said support, and adapted to serve as a tray for a cast, said bottom provided with core-

the inner end of the active roller-lever *b* and adapted to come in engagement with a cross-piece *u* arranged in the head *v* of the valve-rod and to be brought out of engagement with said cross-piece *u* by a nose *n* fixed on the active roller-lever *b*, the said bolt *p* being guided in slots of the head *v* of the valve-rod, substantially as described.



3. In valve-motions for explosion-engines, the combination, of a passive roller-track *w* actuated by the governor and an active roller-lever *b* working upon said passive roller-track *w* and actuated by the eccentric-rod *e*, with a catch *k* loosely mounted on a bolt *p* in the inner end of the active roller-lever *b* and adapted to come in engagement with a cross-piece *u* arranged in the head *v* of the valve-rod and to be brought out of engagement with said cross-piece *u* by a nose *n* fixed on the active roller-lever *b*, the said bolt *p* being guided by links *l*, substantially as described.

4. In valve-motions for explosion-engines, the combination, of a passive roller-track *w* actuated by the governor and an active roller-lever *b* working upon said passive roller-track *w* and actuated by the eccentric-rod *e*, with a catch *k* loosely mounted on a bolt *p* in the inner end of the active roller-lever *b* and adapted to come in engagement with a cross-piece *u* arranged in the head *v* of the valve-rod and to be brought out of engagement with said cross-piece *u* by a nose *n* fixed on the active roller-lever *b*, and springs *i*, *f* holding the active roller-lever *b* in contact with the passive roller-track *w*, and the catch *k* in contact with the nose *n* respectively, substantially as described.

5. In valve-motions for explosion-engines, the combination, of a passive roller-track *w* actuated by the governor and an active roller-lever *b* working upon said passive roller-track *w* and actuated by the eccentric-rod *e*, with a catch *k* loosely mounted on a bolt *p* in the inner end of the active roller-lever *b* and adapted to come in engagement with a cross-piece *u* arranged in the head *v* of the valve-rod and to be brought out of engagement with said cross-piece *u* by a nose *n* fixed on the active roller-lever *b*, a spring *i* holding the active roller-lever *b* in contact with the passive roller-track *w*, and a means for holding the catch *k* in contact with the nose *n*, substantially as described.

818,117. MOLDING-MACHINE. CLAY M. RUNYAN, Elyria, Ohio. Filed Nov. 3, 1904. Serial No. 231,301.

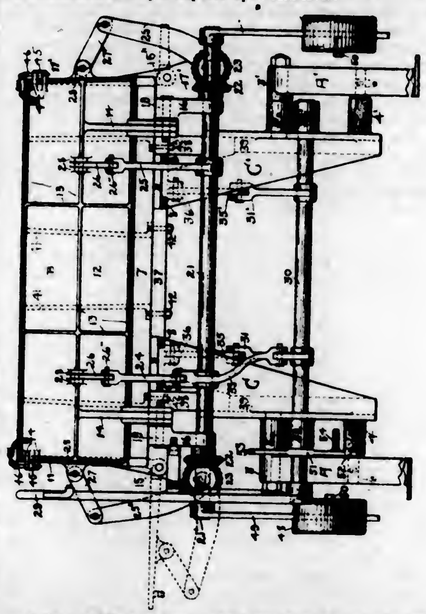
Claim.—1. The combination with a mold having relatively movable sides, of a mechanism for moving said sides, said mechanism including a hand-lever, and a weighted counterbalancing-lever, or several thereof, cooperating with said hand-lever to move said sides and mechanism in one direction.

2. The combination with a mold provided with relatively movable sides and an apertured bottom or tray, of a core movable into and out of said mold, an operating mechanism which includes a series of levers and lever-connecting links, which levers and links are separable to render either said sides or said core inoperative.

3. The combination with a mold provided with rotatable sides, or rotatable sides and ends, and a core movable into and out of said mold, of a mechanism for simultaneously actuating said sides, or sides and ends, and the core, a hand-lever for controlling said mechanism, and means for making said core inoperative while said mechanism is operative as to said sides, or sides and ends.

4. The combination with a mold provided with relatively movable vertical sides and a reciprocating core movable into and out of said mold, of a mechanism for simultaneously actuating said sides and core, a hand-lever for moving said mechanism, means for counteracting overbalance of weight imposed upon said lever, and means for rendering said core inactive while said mechanism moves said sides.

5. In a molding-machine, the combination with a mold provided with rotatable sides and ends and a reciprocating core, of means for simultaneously actuating said sides, ends and core, a lever for moving the operating mechanism, and means for counteracting the overbalance of weight imposed upon said lever.



6. In a molding-machine, a mold consisting of pivotally-movable wing-plates and an off-bearing plate or tray, a support provided with pivot-bearings for said wing-plates and slideways for core-guides, a core mounted upon guides slidable in said slideways, means for adjusting the pivots of said wing-plates toward and from each other to vary the size of the mold, a hand-lever and operating mechanism controlled thereby, and means whereby one movement of said lever simultaneously lowers said wing-plates and core, said mechanism being adjustable to accommodate same to variations in the size of the mold.

7. In a molding-machine, the combination with a mold comprising pivotally-movable wing-plates and a removable tray, of a core mounted for sliding reciprocal movement, a support carrying pivot-bearings for said wing-plates and slideways or tracks for the core-table and its guides, a stationary base upon which said support is mounted for pivotal movement so that it may be adjusted, together with the mold and its actuating mechanism, into either an upright or tilted position, and an actuating mechanism having bearings carried by said support.

8. In a molding-machine, the combination with a mold comprising pivotally-movable wing-plates and a removable tray, of a core-table having slideway-guides thereon, a pivotally-movable support provided with slideways for said guides and pivot-bearings for said wing-plates, a stationary base upon which said support is mounted, a hand-lever and operating mechanism having bearings in said support, and means whereby one movement of said lever simultaneously lowers said wing-plates and core substantially below said tray, while the opposite movement of said lever returns said wing-plates and core to normal position.

9. In a molding-machine, the combination with a mold comprising pivotally-movable wing-plates and a removable tray, of a core mounted for sliding reciprocal movement, a support carrying pivot-bearings for said wing-plates and slideways or guides for said core, a stationary base upon which said support is mounted adjustably for a tilted or an upright position, a hand-lever and operating mechanism provided with bearings in said support, and means whereby one movement of said lever simultaneously lowers said wing-plates and core below the plane of the upper surface of said tray, while the opposite movement of said lever restores said wing-plates and core to normal position.

10. In a molding-machine, a mold consisting of pivotally-movable wing-plates and an apertured bottom or tray, said support provided with pivot-bearings for said wing-plates and slideways for core-guides, a core mounted upon guides slidable in said slideways, means for adjusting the pivots of said wing-plates toward and from each other to vary the size of the mold, a hand-lever and operating mechanism controlled thereby, and means whereby one movement of said lever simultaneously lowers said wing-plates and core below the normal horizontal plane of said tray, said mechanism being adjustable to accommodate same to variations in the size of the mold.

11. In a molding-machine, the combination with a mold provided with rotatable sides and ends and a reciprocating core, of means for simultaneously actuating said sides and ends and the core, means for expanding or contracting the size of said mold, a lever for moving the operating mechanism, and means for counterbalancing the weight of the actuating mechanism imposed upon said lever.

12. In a molding-machine, the combination with a mold provided with normally vertical sides pivoted for rotation above the bottom of said mold, of a core normally within said mold, means for adjusting said mold to occupy either a vertical or an inclined position, means for simultaneously tilting said sides toward the plane of the bottom of said mold and for restoring said sides to normal position, means for lowering said core synchronously with the tilting of said sides and for raising said core when said sides are restored to normal positions, means for expanding or contracting the size of said mold and for adjusting the actuating mechanism to such expansion or contraction, a lever for moving the operating mechanism, and means for counterbalancing the weight of the operating mechanism thrown upon said lever.

13. In a molding-machine, the combination with a support having pivot-bearings, of wing-plates hinged on their bottom edges to said bearings and normally forming the sides of a mold, a series of linked levers for actuating said plates and links between said levers and plates, the latter links provided with a series of spaced-apart pivot-holes, said bearings provided with a similar series of holes, whereby the hinges of said plates and the link-pivots between said levers and plates may be adjusted laterally.

14. In a molding-machine, the combination with a bed-plate having lugs projecting laterally therefrom, of a mold having wing-plates hinged on their bottom edges to said lugs and adapted to form the sides of a mold, said lugs having a series of holes spaced apart for receiving adjustably the pivots of the hinges of said plates.

15. In a molding-machine, the combination with a base consisting of leg-frames having slots therein, of supporting-brackets having bosses and rigid pins, the former pivoted to said leg-frames and the latter movable in said slots, a bed-plate mounted on said brackets, and a series of wing-plates, hinged at their bottom edges to said plate, adapted to form the sides of a mold.

16. In a molding-machine, the combination, with a base, of channel-brackets pivoted to said base and normally supported in a vertical position, a bed-plate mounted on said brackets, hinge-bearings projecting laterally from said plate, a mold having sides hinged to said bearings, a shaft journaled in said bearings, an operating-lever for rotating said shaft, and a series of levers and links between said shaft and sides for transmitting rotary movement from the former to the latter.

17. In a concrete-block machine, a stationary support, brackets having journals mounted in bearings in said support, slots in said support, pins upon said brackets movable in said slots and limited in their movements by the ends of said slots, a base-plate mounted on said brackets, a cast-tray on said plate, wing-plates, hinged at their bottom edges to said base-plate, adapted to form the sides of a mold, a horizontal shaft journaled in bearings in said brackets, a notched quadrant projecting from said bed-plate, a hand-lever provided with a latch adapted to engage said quadrant at either end of the throw of said lever, and connecting arms, levers and links between said shaft and wing-plates whereby rotary movement is transmitted from the former to the latter.

18. In a concrete-block machine, a stationary base, a mold-support pivotally mounted on said base and provided with means for locking it in a fixed position, a mold having wing-plates hinged to said support, a cast-tray loosely mounted on said support substantially between said wing-plates, said cast-tray provided with core-openings, a core-table provided with guides slidable on bearings in said support, a plurality of cores mounted on said table, a lever, and means for moving simultaneously said wing-plates and core-table.

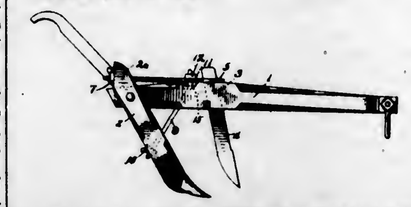
19. In a concrete-block machine, a stationary base, a mold-support pivotally mounted on said base and provided with means for locking it in a fixed position, a mold having wing-plates hinged to said support, a mold-bottom loosely mounted on said support, and adapted to serve as a tray for a cast, said bottom provided with core-openings, a core-table provided with guides slidable on bearings in said support, a plurality of cores mounted on said table and movable through said core-openings, a series of rotary shafts mounted in bearings in said support, means for transmitting movement from one shaft to the other and to said wing-plates, arms rigidly mounted upon several of said shafts, counterweights adjustably mounted on said arms, and a lever for actuating said shafts.

20. In a molding-machine, the combination of a bed-plate, with wing-plates or mold sides; a tray, or off-bearing plate; hinge members pivoted below said tray and arranged to support said wing-plates or mold sides above said tray, said hinge members being constructed to permit the edges of said tray to extend beyond the vertical plane normally occupied by the pivots of said hinge members, and means for adjusting said pivots laterally of said plane to vary the size of the mold.

21. In a molding-machine, the combination with a mold having pivotally-movable wing-plates or sides; with a bottom, tray, or off-bearing plate; a bed-plate arranged to support said bottom below said wing-plates and above the pivots about which said wing-plates or sides are movable, and means for adjusting said wing-plates or sides toward and from each other over the face of said bottom, tray, or off-bearing plate.

22. In a molding-machine, the combination with a mold-box or mold, the sides of which are rotatively mounted on adjustable pivots to vary the size of the mold; of a bottom arranged in a plane below the plane of the lower edges of, and above the pivots for, said sides, when same are in their closed or normal position, and hinge members upon which said sides are rotatable, said hinge members being in the form of goosenecks 14 which are curved outwardly in the plane of said tray to permit the employment of a tray of greater width than the minimum distance between the pivots of said hinge members, whereby the size of the mold may be varied without disturbing said bottom.

813,118. PLOW. LOUIS N. SCHULTZ, Oakland, Miss. Filed Feb. 13, 1905. Serial No. 245,497.



Claim.—1. In a plow, the combination of a standard, a slotted beam, a slotted binding-bar, a colter extending through the slots in said beam and bar, an adjustable brace provided with a wedge portion extending through the slot in said binding-bar and constructed to engage the rear wall of said slot for adjusting and positively locking said bar in clamping position, and a lock-nut for adjusting and locking said brace, substantially as described.

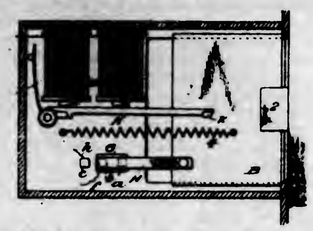
2. In a plow, the combination of a standard, a slotted beam, a slotted binding-bar, a colter extending through the slots in said beam and bar, an adjustable brace extending through the slot in said binding-bar and constructed to engage the rear wall of said slot for adjusting and positively locking said bar in clamping position, two heads carried by said brace in position to engage, respectively, said binding-bar and plow-beam, and a lock-nut for adjusting and locking said brace, substantially as described.

813,119. ELECTRIC LOCK-STRIKE. HARRY F. SMITH, Richmond, Va., assignor of one-third to J. S. Hopkins and one-third to Geo. J. Hooper, Richmond, Va. Filed Jan. 4, 1905. Serial No. 239,663.

Claim.—1. A keeper or casing to receive the lock-bolt of a lock mechanism when projected and having a movable portion for normally confining said lock-bolt, means normally tending to throw the movable part of the keeper aside to release the lock-bolt, a stop mechanism holding the movable portion projected against the action of the retracting means, and an electromagnet included in a circuit to effect release of said stop mechanism, substantially as set forth.

2. A keeper or casing for confining the lock-bolt of a lock mechanism when projected, the same having a movable portion to effect

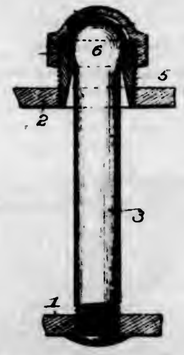
release of said lock-bolt, an electrical circuit for effecting release of said movable part, and a switch controlled by said movable part for interrupting the aforesaid electrical circuit and closing a second electrical circuit, substantially as set forth.



3. A series of lock-releasing devices, each comprising an electromagnet, a movable part, a group of electric contacts and a switch attached to and operating with said movable part for successively throwing the circuits into action and cutting them out of action.

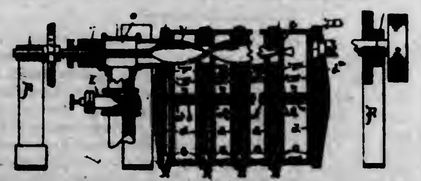
4. In combination, a series of electric lock-releasing devices each included in an independent circuit and comprising a movable part, a group of electric contacts and a switch actuated by means of the movable part to successively throw the electric circuits into action and cutting them out of action, and an alarm-circuit thrown into action by the last lock-release mechanism of the series, substantially as set forth.

813,120. **STAY-BOLT.** JOHN B. TATE, Altoona, Pa., assignor to Flannery Bolt Company, Pittsburg, Pa. Filed Jan. 31, 1905. Serial No. 243,868.



Claim.—The combination with a stay-bolt, of a sleeve or bushing having a partly-spherical socket, an enlarged substantially spherical head on the bolt to fit the socket and project outwardly beyond the same, and a cap-nut on the sleeve or bushing having a partly-spherical inner surface substantially concentric with the bolt-head and constructed to provide a chamber or clearance-space between the head of the bolt and said partly-spherical surface in the cap.

813,121. **FILTER-PRESS.** SIMON TRUSSEMENT, Louisville, Ky., assignor to Henry Vogt Machine Company, Louisville, Ky., a Corporation of Kentucky. Filed June 17, 1905. Serial No. 265,741.

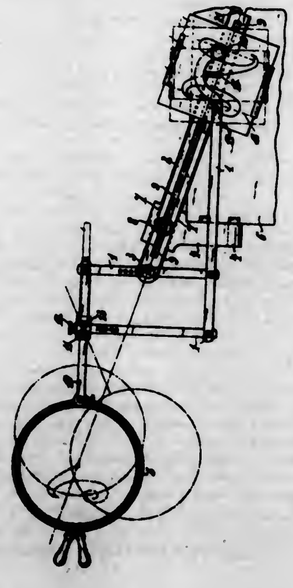


Claim.—1. In a filter-press, a series of separated filter-plates having near their tops alining apertures adapted to have the material distributed therethrough, a rotatable worm-feed passing transversely through all of the alining apertures, the filter-surfaces of the filter-plates being provided with a plurality of closely-adjoining ribs forming deep narrow channels, a filtering-screen for each of the filtering-surfaces, drains on each of the plates communicating with the channels therein and adapted to receive and discharge the liquid therefrom, means for rotating the worm-feed to clear the apertures and distribute the material, alining hubs for each of the plates, said hubs being in contact with the inner face of the filtering-screen, and abutments between the hubs, said hubs and abutments extending continuously from end to end of the filter-press and adapted to relieve the intermediate filter-plates from undue strain, substantially as described.

2. In a filter-press, a series of separated filter-plates having near their tops alining apertures adapted to have the material distributed therethrough, a rotatable worm-feed passing transversely through all of the alining apertures, the filter-surfaces of the filter-plates being provided with a plurality of closely-adjoining ribs forming deep narrow channels, a filtering-screen for each of the filtering-surfaces, drains on each of the plates communicating with the channels therein and adapted to receive and discharge the liquid therefrom, means for rotating the worm-feed to clear the apertures and distribute the material, alining hubs for each of the filter-plates outwardly extending to contact the inner face of the filtering-screen, abutments outwardly extending from the hubs and adapted to clamp the filtering-screen between the hubs and the abutments, and a bolt for each of the filter-plates passing through the hub and the clamping-abutments, the hubs and abutments extending continuously from end to end of the filter and adapted to distribute the pressure on the intermediate filter-plates to the end plates, substantially as described.

3. In a filter-press, a series of filter-plates having alining apertures adapted to receive and distribute material, a rotatable clearing-blade extending through said apertures and adapted to be rotated therein, each of the filter-plates having on its surface closely-positioned vertical ribs forming deep narrow channels between the ribs, a filtering-screen stretched over the surface of the ribs, a hub for each of the plates outwardly projecting to contact the inner face of the filtering-screen, abutments for the plates secured to the hubs and adapted to clamp the filtering-screen between the abutments and the hubs, and bolts for securing the abutments to the hubs, the abutments and the hubs being in alinement with one another and extending from end to end of the filter-press for relieving the intermediate filter-plates from undue pressure, substantially as described.

813,122. **FABRIC-MOVING MECHANISM FOR EMBROIDERING-MACHINES.** MAX TRAUTMANN, Dresden, Germany. Filed Nov. 30, 1904. Serial No. 234,944.



Claim.—1. A guide device for the embroidering-frame for sewing-machines, consisting of a pantograph, a sleeve swiveled to its forward upper pivot, and having its rear lower arm extended, a stylus mounted on the extended end, an embroidering-frame having a stem to slide in said sleeve and means for fixing the said stem and sleeve in any desired position, a slotted slide-bar and means for guiding the same and adjusting it in any position, a pivot at the end of said bar to carry the said pantograph and a supporting-plate for the pattern, adjustable on said slide-bar beneath the stylus substantially as described.

2. A guide device for the embroidering-frame for sewing-machines, consisting of a pantograph, an embroidering-frame adjustably mounted at its forward end, an extended rear end and a stylus mounted therein, a sliding bar having a pivot at its end to engage one of a series of holes in the pantograph-arm, means for guiding the said bar and adjusting it to any desired position, a plate mounted on said bar to support the pattern beneath the stylus and means for adjusting said plate in the manner and for the purpose, substantially as described.

3. A guide device for the embroidering-frame for sewing-machines consisting of a pantograph having a sleeve swiveled to its forward upper pivot and means for arresting the said sleeve in any desired position, an embroidering-frame having a stem to slide in said sleeve and means for adjusting the said stem therein, a sliding bar having a pivot at its forward end adapted to engage in one of a series of holes in the pantograph, a slot in said guide-bar, a plate to support the pattern, said plate having a downwardly-extending pin to engage in the slot of said guide-bar and means for clamping the said pin to the said bar, a guide for said bar and means for clamping the bar in said guide in the manner and for the purpose substantially as described.

813,123. **METHOD OF MAKING GLASS ORNAMENTS.** JACOB TRUB, Castle, N. Y. Filed Sept. 13, 1905. Serial No. 278,115.

Claim.—The herein-described improved method of making glass ornaments with marginal edges provided with innumerable angles to impart to the ornament an iridescent appearance at the edges, consisting of striking the pieces of glass with a file to produce the desired outline in the rough and subsequently filing the edges to form notches for completing the operation, the file being first dipped in water or milk.

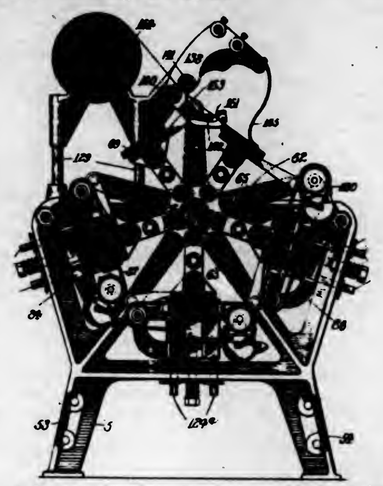
813,124. **MULTICOLOR-PRESS.** CHARLES WILLIAMS, Spokane, Wash., assignor of fifteen-sixteenths to William H. Cowles and John F. Young, Spokane, Wash. Filed Apr. 1, 1903. Serial No. 150,563.

Claim.—1. In a multicolor-press, the combination with a plurality of type-beds, of a rotary member, a plurality of platens movably mounted on the rotary member, means for rotating the member intermittently to bring the platens successively in register with the type-beds, and means for moving the platens independently of the rotary member while the latter is at rest into contact with the type-beds.

2. In a multicolor-press, the combination with a plurality of stationary type-beds, of the plurality of coöperating platens, means for moving said platens to bring them successively in register with said type-beds, paper-feeding mechanism for automatically supplying each platen with a sheet of paper as it passes a certain point in its movement, and means for moving said platens to take an impression when they are in register with the type-beds.

3. In a multicolor-press, the combination with a plurality of type-beds, of a rotary member, a plurality of platens movably mounted on the rotary member, means for rotating the member intermittently to bring the platens successively in register with the type-beds, and means for moving the platens simultaneously and independently of the rotary member while the latter is at rest into contact with the type-beds.

4. In a multicolor-press, the combination with the framework carrying a plurality of stationary type-beds, of a rotary member carrying a plurality of pivoted platens, means for rotating said member to bring the platens successively in register with the type-beds, and means for moving the platens on their pivots to contact with the type-beds when in register therewith.



5. In a multicolor-press, the combination with the plurality of stationary type-beds, of the plurality of moving platens adapted to register successively with said type-beds, paper-feeding mechanism for feeding a sheet of paper to each platen as it passes a certain point, inking mechanism for each of the type-beds, and means for moving the platens to contact with the type-beds while the platens are in register therewith.

6. In a multicolor-press, the combination with the stationary type-beds, of the platens, means for moving the platens, to register successively with the type-beds, inking mechanism for each of said type-beds, and means for moving the platens to contact with the type-beds when they are in register therewith so that blanks carried by the platens will be printed.

7. In a multicolor-press, the combination with the stationary type-beds grouped at equal radial distances from a common center, of the shaft concentric with the general outline of said beds, the spider loosely mounted on said shaft, the platens pivoted on the spider, toggle-links between said shaft and platen, and a lock for said spider; the parts being so arranged that the movement of the shaft when the spider is locked will cause the platens to be moved to contact with the type-beds with which they are in register, and the movement of the shaft when the spider is unlocked serves to carry the spiders and platens into a new registration with the type-beds.

8. In a multicolor-press, the combination with the stationary type-beds grouped at equal radial distances from a common center, of the shaft concentric with the general outline of said type-beds, the spider loosely mounted on said shaft, means for locking said spider in certain positions of adjustment, a disk rigidly secured to said shaft, platens pivoted to the outer ends of the arms of the spider, and links connecting the disk and the platens whereby the movement of the shaft while the spider is locked serves to take the impressions, and the movement of the shaft when the spider is unlocked serves to advance it and the spider to bring the platens to a new registration.

9. In a multicolor-press, the combination with the stationary type-beds grouped at equal radial distances from a common center, of the shaft mounted concentrically with the general outline of said type-beds, the spiders loosely mounted thereon near the ends of said shaft, the platens pivoted between the opposite arms of said spiders, the disks secured upon the shafts between the spiders, means for locking said spiders from movement, and the links connecting said disks and platens so that the movement of the shaft when the spiders are locked will cause the platens to be brought into contact with the type-beds, and the movement of the shaft when the spiders are unlocked will cause the spiders and platens to be advanced to a new registration.

10. In a multicolor-press, the combination with the stationary type-beds grouped at equal radial distances from a common center,

of the shaft concentric with the general outline of said beds, the spider loosely mounted on said shaft, means for locking said spider

19. In a multicolor-press, the combination with a plurality of type-beds facing a common center, of a plurality of coöperating plat-

ply it to the surface of the inking-cylinder, and then to reverse its movements to bring it back to the inking-roller.

vanced to another new position; and fourth, to be moved outward and returned, and means for imparting such movement to the shaft.

of the shaft concentric with the general outline of said beds, the spider loosely mounted on said shaft, means for locking said spider from movement, platens pivoted to the outer ends of the arms of said spider, a disk on the shaft, and links connecting said platens and said disk, the arrangement of parts being such that when the shaft is rotated forward with the spider unlocked the spider and platens will be carried to a new registration, when a further movement of the shaft in the same direction with the spider locked will cause the platens to be moved into contact with the type-beds and retracted, when a further movement of the shaft in the same direction with the spider unlocked will cause the spider and platens to be moved to a fresh registration, and finally when the movement of the shaft is reversed and with the spider locked from movement the platens will be moved outward to contact with the type-beds.

11. In a multicolor-press, the combination with the stationary type-beds grouped at equal radial distances from a common center, of the shaft concentric with the general outline of said beds, the spider loosely mounted on said shaft, means for locking said spider from movement, platens pivoted to the outer ends of the arms of said spider, a disk on the shaft, and links connecting said platens and said disk, the arrangement of parts being such that when the shaft is rotated forward with the spider unlocked the spider and platens will be carried to a new registration, when a further movement of the shaft in the same direction with the spider locked will cause the platens to be moved into contact with the type-beds and retracted, when a further movement of the shaft in the same direction with the spider unlocked will cause the spider and platens to be moved to a fresh registration, and finally when the movement of the shaft is reversed and with the spider locked from movement the platens will be moved outward to contact with the type-beds, and means for giving said shaft a cycle of movements consisting of three forward movements and a reverse movement.

12. In a multicolor-press of the class described in which the spider is alternately locked from movement and then allowed to move, the frame, a spider mounted to rotate therein, a locking mechanism consisting of a cam-disk mounted on a shaft, a yoke on the end of each arm of the spider, and a pivoted lever extending from the cam to the yoke and adapted to be forced into engagement with said yoke by the cam when the spider is to be locked from movement.

13. In a printing-press, the combination with a movable platen, of the clamps mounted thereon and adapted to occupy clamping or non-clamping positions, springs adapted to hold said clamps yieldingly in either position, and fingers adapted to engage said clamps to move them from one to the other position as the platen moves.

14. In a printing-press, the combination with the movable platens and a type-form with which they are successively brought in register by a movement continuously forward, means for reciprocating said platens transversely to the line of movement at each registration, of the paper-clamps pivoted on the ends of said platens, and cam-fingers suitably located so that when the platen reaches its discharge position and is moved outward for the printing stroke the clamps will contact with the cam-fingers and be opened thereby.

15. In a printing-press, the combination with the moving platen occupying successive positions, and means for reciprocating it, of the clamps pivotally mounted on the ends thereof, and cam-fingers so located that when the platen is moved out and returned at the feeding position the clamps by contact with the said cam-fingers will be brought down on the platen to secure the paper in position.

16. In a printing-press, the combination with the movable platens occupying successively the discharge and feed positions, means for reciprocating said platen transversely to the line of movement at each position of the clamps pivotally mounted on the ends thereof, and duplicate cam-fingers, said fingers being adapted to be contacted by the clamps as the platens are moved outward and inward in said discharge and feed positions to respectively open the clamps and discharge the paper and to close the clamps to secure the new sheet.

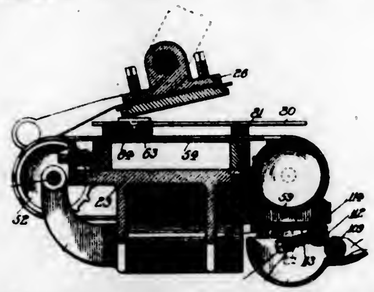
17. In a printing-press, the combination with the platen, of the clamping-bars movable to and from and coöperating with the surface of said platen, the yielding rim formed on the under surface of the clamps to produce a vacuum-cavity, and the valve communicating with said cavity to permit the escape of the air therein as the clamps are brought down upon the surface of the platen.

18. In a printing-press, the combination with the platen, of the paper-clamps movably mounted thereon and adapted to coöperate therewith to hold a sheet of paper in place upon the platen, the rubber rim or boss surrounding the under surface of the clamps, the aperture through said clamps communicating with the vacuum-chamber formed by the rubber rim, and the leaf-spring valve coöperating with said aperture; substantially as and for the purpose described.

19. In a multicolor-press, the combination with a plurality of type-beds facing a common center, of a plurality of coöperating platens, means for moving said platens to bring them successively in register with said beds, and means for moving them to take an impression when they are in register.

20. In a multicolor-press, the combination with a shaft, a plurality of type-beds grouped about the shaft, a rotatable member on the shaft, a plurality of platens on the rotatable member, means for rotating the member intermittently to bring the platens successively in register with the type-beds, means for locking the rotatable member between its intermittent movements, and connections between the shaft and the platens whereby when the rotatable member is locked and the shaft turned the platens are moved to take an impression from the type-beds.

813,125. **INKING MECHANISM FOR PRESSES.** CHARLES WILLIAMS, Spokane, Wash., assignor of seven-eighths to William H. Cowles and John F. Young, Spokane, Wash. Filed Apr. 1, 1903. Serial No. 150,566.



Claim.—1. In an inking mechanism, the combination with a type-bed, inking-cylinder, and means for supplying said cylinder with ink, of sprocket-wheels mounted at the sides and ends of said type-bed, a pair of sprocket-chains coöperating with said wheels and moving parallel to the type-bed and around said cylinder during a portion of their course, and inking-rollers mounted in a carriage secured at its ends to said sprocket-chains.

2. In an inking mechanism, the combination with a type-bed, inking-cylinder, and means for supplying said cylinder with ink, of sprocket-wheels mounted at the sides and ends of said type-bed, a pair of sprocket-chains coöperating with said wheels and moving parallel to the type-bed and around said cylinder during a portion of their course, inking-rollers mounted in a carriage secured at its ends to said sprocket-chains, and guides parallel to the type-bed with which the inking-roller carriage coöperates as it is reciprocating over the type-bed.

3. In an inking mechanism, the combination with a type-bed, of an inking-cylinder located adjacent one end thereof, inking-rollers adapted to reciprocate over said type-bed and around said inking-cylinder, and means for reciprocating said inking-rollers and for rotating the inking-cylinder in the opposite direction to the forward movement of the inking-rollers when in contact therewith.

4. In an inking mechanism, the combination with a type-bed, of a shaft mounted to rotate at one end thereof, a pair of sprocket-wheels secured on said shaft, an inking-cylinder shaft mounted parallel to the first-mentioned shaft at the other end of the type-bed, an inking-cylinder on said shaft, a pair of sprocket-wheels loosely mounted on the ends of the inking-cylinder shaft, a pair of sprocket-chains coöperating with said sprocket-wheels, inking-rollers mounted in a carriage secured to said sprocket-chains and reciprocated thereby over the type-bed and about the inking-cylinder, and gear mechanism between said sprocket-wheels and the inking-cylinder to cause the latter to rotate in the opposite direction to the movement of the inking-rollers when they are in contact therewith.

5. In an inking mechanism, the combination with the inking-cylinder, of the semicylindrical distributing-concave mounted parallel thereto, a shaft adapted to rock in bearings formed concentrically with the distributing-concave, a distributing-roller carried by and mounted eccentrically on said shaft, an ink-trough, an inking-roller, a ratchet secured to said inking-roller and a dog coöperating therewith to prevent its movement in but one direction, and means for rocking said shaft to cause the distributing-roller to first take ink from the inking-roller, then distribute it over the concave, finally apply it to the surface of the inking-cylinder, and then to reverse its movements to bring it back to the inking-roller.

6. In an inking mechanism, the combination with the inking-cylinder, of a pair of distributing-rollers beneath and coöperating therewith, a spring-pressed frame to hold said rollers in contact with the cylinder with a uniform pressure, and means for reciprocating the rollers longitudinally of the cylinder and independently of the frame.

7. In an inking mechanism, the combination with an inking-cylinder, of an ink-trough located beneath said cylinder and parallel thereto, a pair of distributing-rollers constantly engaging the surface of the inking-cylinder, a frame carrying said distributing-rollers, and helically-coiled expanding springs interposed between said ink-trough and said frame to hold the distributing-rollers in contact with the inking-cylinder.

8. In a device of the class described, the combination with a plurality of type-beds, of an inking mechanism for each consisting of a roller adapted to reciprocate over the bed, a reciprocating chain to which the roller is connected, a rotating shaft, and connections between said shaft; and chains for actuating the inking mechanisms simultaneously during the rotation of said shaft.

9. In a device of the class described, the combination with a plurality of type-beds, of an inking mechanism for each, a rotating shaft, and connections between said shaft and mechanism for actuating them simultaneously during the rotation of said shaft consisting of a rock-shaft connected to each inking mechanism, a link connected to each rock-shaft, and an eccentric on the rotating shaft for each link properly located so that the rock-shafts are operated simultaneously.

10. In a device of the class described, the combination with a plurality of type-beds, of an inking mechanism for each consisting of rollers adapted to reciprocate over the bed, a reciprocating chain to which the rollers are connected, a rock-shaft for each inking mechanism, connections between each rock-shaft and chain for reciprocating the chain as the shaft is rocked, a rotating shaft, and connections between said rotating shaft and the rock-shafts for actuating the inking mechanisms simultaneously during the rotation of said shaft.

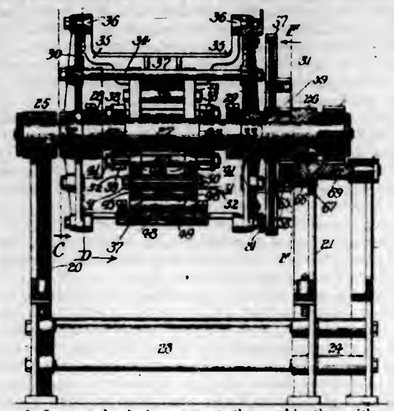
11. In an inking mechanism, the combination with an inking-cylinder and means for rotating the same, of a frame carrying a pair of distributing-rollers in contact with the inking-cylinder, and means for reciprocating said rollers longitudinally of the cylinder consisting of a cam-track on the end of the cylinder, a pivoted yoke the arms of which coöperate with the said track, and arms on said yoke engaging with the ends of the distributing-rollers.

12. In an inking mechanism, the combination with an inking-cylinder and means for rotating the same, of a frame carrying a pair of distributing-rollers in contact with the inking-cylinder, and means for reciprocating said rollers longitudinally of the cylinder consisting of a cam-track on the end of the inking-cylinder, a yoke mounted to rock on a vertical axis and having arms coöperating with said cam-track, another pair of arms provided with pins projecting therefrom, and grooved disks on the ends of the distributing-rollers with which said pins coöperate so that the swinging movement of the yoke is imparted in the form of a longitudinal reciprocation to the distributing-rollers.

13. In an inking mechanism, the combination with a pair of inking-rollers, of a carriage for said rollers, and means for holding said rollers under suitable tension for engagement with the type, said means consisting of a plate secured to the carriage at each end of the rollers and having the elongated vertical bearings 68 for the ends of said rollers, the bearing-plates 72 having the bearing-surfaces engaging the tops of said roller-shafts, and the springs pulling said plates together; substantially as and for the purpose described.

813,126. **MECHANICAL MOVEMENT.** CHARLES WILLIAMS, Spokane, Wash., assignor of fifteen-sixteenths to William H. Cowles and John F. Young, Spokane, Wash. Filed Apr. 1, 1903. Renewed July 21, 1905. Serial No. 270,749.

Claim.—1. In a mechanical movement, the combination with a shaft mounted to rotate in bearings, of a frame mounted frictionally thereon, means for locking said frame at intervals to prevent its movement with the shaft, a member movably secured to said frame, a toggle-joint connection between said shaft and said member; the parts being so arranged and constructed that three forward movements of the shaft, the frame being locked from movement during the two extreme forward movements, and a reverse movement of said shaft, will cause the member first, to be advanced to a new position; second, to be moved outward and returned; third, to be advanced to another new position; and fourth, to be moved outward and returned, and means for imparting such movement to the shaft.



2. In a mechanical movement, the combination with a shaft mounted in suitable bearings, of a pair of arms frictionally mounted thereon, means for locking these arms from movement at each position of adjustment, a member pivotally mounted between the outer ends of these arms, and toggle-joint mechanism between said shaft and said member, the parts being arranged and constructed to operate as described.

3. In a mechanical movement, the combination with a shaft mounted in suitable bearings, of a pair of arms frictionally mounted thereon, means for locking these arms from movement at each position of adjustment, a member pivotally mounted between the outer ends of these arms, and toggle-joint mechanism between said shaft and said member, said connections consisting of a pair of disks secured on the shaft to which and to the member are pivoted a pair of links, the parts being arranged and constructed to operate as described.

4. In a mechanical movement, the combination with a shaft mounted to rotate in bearings, of arms mounted frictionally thereon, means for locking said arms at intervals to prevent their movement with the shaft, a member movably secured to the outer end of said arms, and toggle-joint connections between said shaft and said member; the parts being so arranged and constructed that three forward movements of the shaft, the arms being locked from movement during the two extreme forward movements, and a reverse movement of said shaft, will cause the member first, to be advanced to a new position; second, to be moved outward and returned, third, to be advanced to another new position; and fourth, to be moved outward and returned, and means for imparting such movement to said shaft.

5. In a mechanical movement, the combination with a shaft mounted to rotate in bearings, of arms mounted frictionally thereon, means for locking said arms at intervals to prevent their movement with the shaft, a member movably secured to the outer end of said arms, and toggle-joint connections between said shaft and said member; the parts being so arranged and constructed that three forward movements of the shaft, the arms being locked from movement during the two extreme forward movements, and a reverse movement of said shaft, will cause the member first, to be advanced to a new position; second, to be moved outward and returned; third, to be advanced to another new position; and fourth, to be moved outward and returned, and means for imparting such movement to said shaft consisting of a pinion and a gear member having three sets of teeth adapted to engage with one side of said pinion ultimately connected to said shaft and another set of teeth adapted to engage with the other side of said pinion.

6. In a mechanical movement, the combination with a shaft mounted to rotate in bearings, of arms mounted frictionally thereon, means for locking said arms at intervals to prevent their movement with the shaft, a member movably secured to the outer end of said arms, and toggle-joint connections between said shaft and said member; the parts being so arranged and constructed that three forward movements of the shaft, the arms being locked from movement during the two extreme forward movements, and a reverse movement of said shaft, will cause the member first, to be advanced to a new position; second, to be moved outward and returned; third, to be ad-

vanced to another new position; and fourth, to be moved outward and returned; and means for imparting each movement to said shaft consisting of a gear-pinion on said shaft and a short shaft having two gear-pinions thereon one of which engages with said gear-pinion on said main shaft, and the other gear-pinion, and a constantly-rotating gear-disk having three sets of teeth adapted to engage with one side of said last-mentioned pinion and a fourth set adapted to engage with the other side of said pinion.

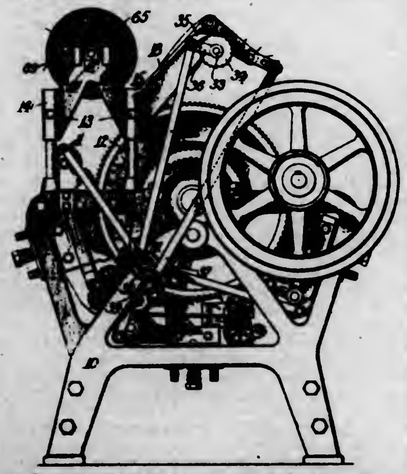
7. In a mechanical movement, the combination with a shaft mounted to rotate in suitable bearings, of a spider frictionally mounted thereon and having a plurality of equidistant arms, members movably mounted on the outer ends of said arms, and toggle-joint connections between said members and said shaft; substantially as and for the purpose described.

8. In a mechanical movement, a shaft mounted to rotate in suitable bearings, a pair of spiders frictionally mounted thereon each provided with the same number of equidistant arms, swinging members pivotally mounted between the outer ends of the opposed arms, locking mechanism to lock said spiders from movement at any position of adjustment, and toggle mechanism between each of said members and said shaft; substantially as and for the purpose described.

9. In a mechanical movement, a shaft mounted to rotate in suitable bearings, a pair of spiders frictionally mounted thereon each provided with the same number of equidistant arms, swinging members pivotally mounted between the outer ends of the opposed arms, locking mechanism to lock said spiders from movement at any position of adjustment, and toggle mechanism between each of said members and said shaft, said toggle mechanism consisting of a pair of collars secured on said shaft, and links connecting each of said collars and said members; substantially as and for the purpose described.

10. In a mechanical movement, the combination with a shaft mounted in bearings, of a frame frictionally mounted thereon, means for locking the frame against movement at each position of adjustment, a member pivotally mounted on the frame; and a toggle-joint connection between the shaft and member, the parts being arranged and constructed to operate as described.

818,127. **PAPER-FEEDING MECHANISM.** CHARLES WILLIAMS, Spokane, Wash., assignor of fifteen-sixteenths to William H. Cowles and John F. Young, Spokane, Wash. Filed Apr. 1, 1903. Renewed July 21, 1905. Serial No. 270,741.



Claim.—1. In a device of the class described, the combination with the support for a roll of paper, of a stationary frame, a pair of feed-rollers mounted on the frame, a ledger-blade fixed on the frame, a swinging cutting-blade coöperating therewith, and mechanism for alternately operating the feed-rollers and the cutting-blade; substantially as and for the purpose described.

2. In a device of the class described, the combination with a paper-roll support, of a stationary frame, a pair of feed-rollers mounted in bearings on the frame, means for adjusting the amount of movement given to said rollers at each operation, a ledger-blade fixed on the frame, a swinging cutting-blade coöperating therewith, means for regulating the time and throw of said swinging blade, and means for alternately operating said feed-rollers and swinging said cutting-blade; substantially as and for the purpose described.

3. In a device of the class described, the combination with the roll-support and the feed-rollers, of a ledger-blade, a swinging and cutting blade coöperating therewith, and means for swinging said blade consisting of a continuously-rotating shaft carrying a slotted arm, a bearing-pin secured in said slotted arm, a link secured to said bearing-pin, a rock-shaft having a slotted arm to the other end of which said link is pivotally secured, another slotted arm on said rock-shaft, and a link connecting said last-mentioned slotted arm and the swinging cutting-blade.

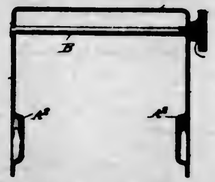
4. In a device of the class described, the combination with the paper-roll support, of the paper-feeding rolls, the ledger-blade and the coöperating swinging cutting-blade, a continuously-rotating shaft carrying an arm slotted at both ends, and connections with one slotted end of said arm for operating the paper-feeding rolls and connections with the other slotted end of said arm for alternately operating the swinging knife.

5. In a device of the class described, the combination with the paper-roll-holding mechanism, of the framework therefor having an intermittently-rotating shaft and a rock-shaft mounted therein, a pair of feed-rolls mounted in said framework and actuated from said intermittently-rotated shaft, a fixed ledger-blade and a swinging cutting-blade coöperating therewith actuated by the rock-shaft, a continuously-rotating shaft, and connections between said continuously-rotating shaft and the intermittently-rotated shaft and the rock-shaft for alternately operating the feeding-rolls and the cutting-blade.

6. In a device of the class described, the combination with the paper-roll-holding mechanism, of the framework therefor having an intermittently-rotating shaft and a rock-shaft mounted therein, a pair of feed-rolls mounted in said framework and actuated from said intermittently-rotated shaft, a fixed ledger-blade and a swinging cutting-blade coöperating therewith actuated by the rock-shaft, a continuously-rotating shaft, and connections between said continuously-rotating shaft and the intermittently-rotated shaft and the rock-shaft for alternately operating the feeding-rolls and the cutting-blade, said connections consisting of a slotted bar on the continuously-rotating shaft having an adjustable bearing-block in one end thereof to which is pivotally secured a link pivoted to a swinging arm carrying a dog engaging a ratchet-wheel secured on said intermittently-rotated shaft and another link pivotally secured to the other end of the slotted bar at one end and at the other end to an arm secured to said rock-shaft.

7. In a device of the class described, a support for paper-rolls consisting of the shaft mounted at one end in the bearing-block 65 having the set-screw 61 secured thereto for moving the bearing longitudinally of the shaft and means for adjusting the shaft at each end transversely, said means consisting at one end of the stationary set-screw with the coöperating set-screw for engaging the two sides of said bearing and at the other end of the helically-coiled expanding-spring and the set-screw for engaging the opposite sides of said bearing; substantially as and for the purpose described.

818,128. **PAPER-FIXTURE.** HARRY J. WILLIAMS, Meriden, Conn., assignor to United States Envelope Company, Springfield, Mass., a Corporation of Maine. Filed June 19, 1903. Serial No. 162,164.

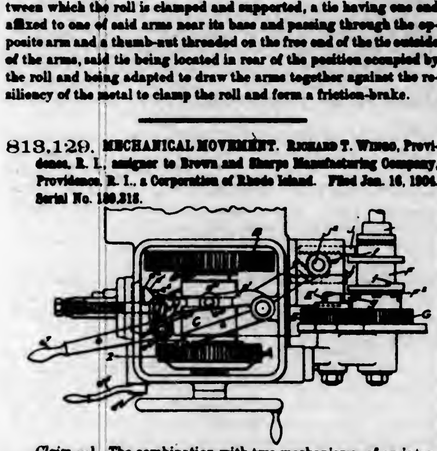


Claim.—1. A fixture of the class described comprising a metal plate having its end portions bent forward to form the side arms of the fixture, said arms having inwardly-extending projections opposite each other to form the journals for a roll of paper and an adjustable tie-bolt connecting said arms in rear of the projections, whereby the arms may be moved toward each other to press the inner faces of the arms against the sides of the roll to create friction; substantially as described.

2. A fixture of the class described comprising an integral resilient sheet-metal plate having its end portions bent forward to form side arms or brackets, said arms having integral inwardly-extended, annular, tapered projections forming journals for the roll held between the arms, and an adjustable tie-bolt connecting the arms whereby said arms may be pressed against the sides of the roll to create friction, said tie-bolt being in rear of the roll, whereby a roll may be inserted or removed without the removal of the tie; substantially as described.

3. A fixture of the class described comprising a sheet-metal plate having its end portions bent forward to form side arms between which the roll is clamped and supported, a tie having one end affixed to one of said arms near its base and passing through the opposite arm and a thumb-nut threaded on the free end of the tie outside of the arms, said tie being located in rear of the position occupied by the roll and being adapted to draw the arms together against the resiliency of the metal to clamp the roll and form a friction-brake.

818,129. **MECHANICAL MOVEMENT.** RICHARD T. WINSOR, Providence, R. I., assignor to Brown and Sharpe Manufacturing Company, Providence, R. I., a Corporation of Rhode Island. Filed Jan. 16, 1904. Serial No. 189,318.



Claim.—1. The combination with two mechanisms, of an intermittently-operating mechanism, devices for throwing either of the two mechanisms into and out of operation and throwing the intermittent mechanism into operation when the throwing of either of the two mechanisms into operation follows the throwing of the other out of operation, substantially as described.

2. The combination with two mechanisms, of a clutch for throwing either mechanism into operation, and an intermittently-operating mechanism controlled through the movement of said clutch, substantially as described.

3. The combination with two mechanisms, of a clutch for throwing either mechanism into operation, an intermittently-operating clutch controlled through the movement of said former clutch, substantially as described.

4. The combination with two mechanisms, of a clutch for throwing either mechanism into operation, a second clutch, devices intermediate of the clutches for throwing said second clutch into operation when the engagement of the first clutch with either mechanism follows its disengagement from the other mechanism, substantially as described.

5. The combination of two mechanisms, a clutch for throwing either mechanism into operation, a second clutch, devices intermediate the clutches for throwing the second clutch into operation when the engagement of the first clutch with either mechanism follows its disengagement from the other mechanism and for throwing said second clutch out of operation after a half-revolution, substantially as described.

6. The combination with a mechanism, of a clutch for throwing said mechanism into and out of operation, a clutch-shifting device, a second clutch, devices for engaging and disengaging said second clutch controlled by the movement of the device for shifting the first clutch, substantially as described.

7. The combination with two mechanisms, of a clutch for throwing either mechanism into operation, a second clutch, rotary and non-rotary members coöperating to throw said second clutch out of operation, devices connected with said first clutch for withdrawing a non-rotary member from engagement with a rotary member and simultaneously moving a non-rotary member into the path of a rotary member, substantially as described.

8. The combination with a clutch, of one or more cams carried by the clutch, one or more abutments for coöperating therewith to hold the clutch out of operation, a second clutch, a device for throwing said second clutch into operation, and connections between said device and the abutment or abutments for withdrawing an abutment from engagement with a cam and simultaneously moving an abutment into the path of a cam, substantially as described.

9. The combination with two mechanisms, of a clutch for throwing either mechanism into operation, an intermittently-operating mechanism including a driven gear, a driving-gear having diametrically opposite blank spaces, a clutch for rotating said driving-gear, one or more cams carried by said clutch, one or more abutments for coöperating therewith to hold the clutch out of operation, devices connected with said first clutch for withdrawing an abutment from engagement with a cam and simultaneously moving an abutment into the path of a cam, locking-segments rotating with the driving-gear and coöperating locking-shoes rotating with the driven gear, substantially as described.

10. The combination with a driven gear, of a driving-gear having blank spaces, locking-segments corresponding with the blank spaces, pairs of locking-shoes rotating with the driven gear, each pair being separated by a clearance-space; a clutch for intermittently rotating the driving-gear, rotary and non-rotary members for throwing the clutch into and out of operation, and means for disengaging a non-rotary member from a rotary member and simultaneously moving a non-rotary member into the path of a rotary member, substantially as described.

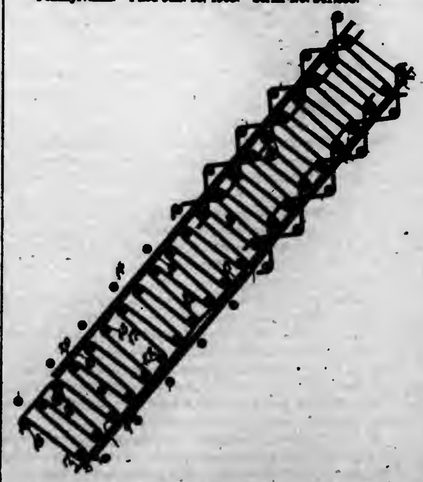
11. The combination with a driven gear, of a driving-gear which makes the same number of revolutions and is provided with diametrically opposite blank spaces, and mechanism for intermittently rotating the driving-gear the distance between successive blank spaces, substantially as described.

12. The combination with a driven gear, of a driving-gear which makes the same number of revolutions and is provided with diametrically opposite blank spaces, a clutch for driving said gear, and devices for disengaging said clutch at each half-revolution, substantially as described.

13. The combination with a driven gear, of a driving-gear having a blank space, a locking-segment rotating with the driving-gear, coöperating locking-shoes rotating with the driven gear and separated by a clearance-space for the locking-segments, substantially as described.

14. The combination with a driven gear, of a driving-gear having diametrically opposite blank spaces, locking-segments corresponding with the blank spaces, two pairs of locking-shoes rotating with the driven gear each pair being separated by a clearance-space for the coöperating locking-segments, substantially as described.

818,130. **WOVEN PILE FABRIC.** JOHN SIEBERMAN, Philadelphia, Pa., assignor to Philadelphia Tapestry Mills, a Corporation of Pennsylvania. Filed Jan. 18, 1906. Serial No. 296,806.



Claim.—1. In a double-pile fabric having a double upper and a double lower weft plane, a body-warp interposed between the weft-threads in each plane, a pile-warp engaging adjoining wefts of the inner rows of wefts singly and binding-warps passing alternately

over one of the weft-threads of the outer row of wefts and under two

6. In a pile fabric, inner and outer planes of wefts and a com-

6. In a device of the character described, a gage, a projecting

2. A steam-generator comprising a vertical outer casing and

over one of the weft-threads of the outer row of wefts and under two of the weft-threads of the inner row of wefts in each plane.

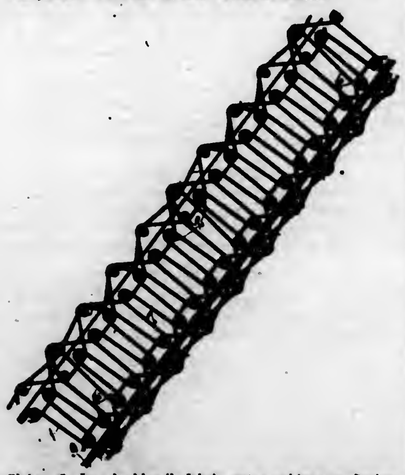
2. In a double-pile fabric, inner and outer rows of weft-threads, a stuffer passing between said rows, pile-warps passed around each of the inner weft-threads and binder-warps binding two inner weft-threads and one outer weft-thread in one shed, whereby the two inner weft-threads with the pile-warps lapped around them are tightly bound side by side with the outer weft-thread bound with the two inner weft-threads at the junction of the same.

3. In a double-pile fabric, weft-threads arranged in inner and outer planes, a binding-warp uniting a group of inner weft-threads in one plane to outer weft-threads, and a pile-warp uniting all of the inner weft-threads in the two inner planes with a grouping differing in number from that embraced in the inner plane by the binding-warp.

4. In a double-pile fabric, inner and outer planes of weft-threads, a binding-warp uniting a plurality of inner weft-threads to single outer weft-threads and a pile-warp passing around each of the inner weft-threads individually.

5. In a pile fabric, weft-threads in two planes, pile-warps evenly distributed between the wefts and lapped around weft-threads in one plane and warps binding wefts of the said plane to wefts in the other plane in a different grouping from that in which the pile-warps lap them.

813,131. **WOVEN PILE FABRIC.** JOHN ZIMMERMAN, Philadelphia, Pa., assignor to Philadelphia Tapestry Mills, a Corporation of Pennsylvania. Filed Jan. 18, 1905. Serial No. 241,580.



Claim.—1. In a double-pile fabric, outer and inner weft planes in each fabric and a combined pile and binding warp lying between the planes of weft-threads of one fabric in a portion only of its extent when not making pile.

2. In a double-pile fabric, a plurality of rows of weft-threads forming an upper and a lower cloth in combination with a pile-warp crossing from one cloth to the other and engaging with an inner row of wefts of the upper and lower cloth and an outer row of wefts upon one side only of one of the cloths.

3. A double-pile fabric having in each single fabric two weft planes, warp-threads passing from one fabric to the other to form the pile, and when not thus disposed passing to the back of the single fabrics where they are interwoven with the wefts of the outer plane.

4. In a double-pile fabric, upper and lower weft planes, body-warps between the wefts in said planes, and pile-warps engaging with the outer weft of one plane and the inner wefts of both planes to serve both as figure-warps and binding-warps.

5. In a double-pile fabric having in each single fabric two weft planes, a pile-warp passing alternately above and below the weft of one of the outer rows when not in the pile and when in the latter engaging with the inner rows of wefts for a predetermined number of picks, pile-warps passing alternately above and below each weft of the other outer row and binding-warps passing alternately over one of the outer rows of wefts and under two of the inner rows of wefts.

6. In a pile fabric, inner and outer planes of wefts and a combined pile and binding warp forming a plurality of double passages of pile between binding positions.

7. In a pile fabric, inner planes of weft-threads, an outer plane of weft-threads and a warp-thread alternating around wefts of opposite inner planes and also above and below successive wefts of the outer plane.

8. In a double-pile fabric a plurality of inner and outer planes of weft-threads and a warp continuously binding the threads of an outer plane of wefts together and intermittently uniting threads of opposite inner planes.

9. In a pile fabric, a plurality of planes of outer warps, a plurality of planes of inner warps each having its threads a multiple of those of the corresponding outer plane, a combined pile and binding warp making cloth with the wefts of an outer plane and a binding-warp uniting the wefts of this outer plane to the wefts of its inner plane in the multiple relation existing between the threads of the planes.

10. In a double-pile fabric, outer and inner planes of weft-threads, a combined pile and binding warp uniting the wefts of the outer plane upon one side at all times and extending through and around the inner wefts of the opposite side to form pile for a portion of the double fabric, and a combined pile and binding warp upon the opposite side uniting the wefts of the outer plane upon this opposite side and forming pile for another portion of the double fabric.

11. In a double-pile fabric, inner and outer weft-threads, a pile-warp passing around inner wefts in both planes throughout a portion of the fabric but passing at intervals outside of outer weft threads and independent binding-warps uniting inner and outer weft-threads.

12. In a double-pile fabric, inner and outer weft-threads upon each side of the fabric, a combined pile and binding warp acting as a pile throughout one portion of the fabric and as a binder upon one side of the fabric throughout a succeeding portion of the fabric and an independent binding-warp uniting the wefts upon the side of the fabric united by the combined pile and binding warp.

13. In a double-pile fabric, inner and outer weft-threads upon each side of the fabric, a combined pile and binding warp acting as a pile throughout one portion of the fabric and a binder upon one side of the fabric throughout the succeeding portion of the fabric, and an independent binding-warp uniting the wefts upon the side of the fabric united by the combined pile and binding warp and an independent binding-warp upon the opposite side of the fabric.

14. In a double-pile fabric, inner and outer weft-threads upon each side of the fabric, combined pile and binding warps binding in successive portions of the fabric and forming pile at intervals, and an independent binding-warp uniting the inner and outer weft-threads throughout the successive sections.

813,132. **PILE-GAGE.** JOHN ZIMMERMAN, Philadelphia, Pa., assignor to Philadelphia Tapestry Mills, a Corporation of Pennsylvania. Filed Jan. 18, 1905. Serial No. 241,540.

Claim.—1. In a device of the character described, a gage, an arm hinged thereto, a depending end for said arm, a lay coacting with the depending end and means whereby said arm may be raised and lowered when the shuttle passes through the shed.

2. In a device of the character described, a gage, an arm hinged thereto, means coacting with said end, whereby said arm is raised or lowered when the shuttle is passing through the shed, and means for drawing the gage out of the cloth during the process of weaving.

3. In a device of the character described, a gage, an arm hinged thereto, a lay coacting with said arm, means whereby the latter is raised and lowered when the shuttle is passed through the shed, and means for drawing the gage out of the cloth during the process of weaving.

4. In a device of the character described, a gage, an arm hinged thereto, a depending end on said arm, a lay, a strip secured thereon in the path of which said depending end passes and by means of which the movements of said gage are regulated and means for actuating said arms.

5. In a device of the character described, a gage, a swinging arm secured thereto, a depending end on said arm, an upper and a lower eye on said end, a cord secured to said upper eye and to means by which said cord is actuated, suitable means attached to said lower eye, a lay and means thereon whereby the movements of said gage are automatically regulated.

6. In a device of the character described, a gage, a projecting ring at one end thereof, an arm having an opening adapted to receive said ring which latter forms a hinge on which said arm is movable, means for raising and lowering said arm and automatic means for regulating the movement of said gage.

7. In a device of the character described, a pile-gage having a swinging arm, a depending end, a lay and a bar secured thereto which acts in conjunction with said end to regulate the movement of said gage.

8. A floating pile-gage and means for longitudinally moving the gage.

9. A floating pile-gage, a lay, and means upon the gage coöperating with said lay to cause longitudinal movement of the gage.

10. A floating pile-gage having a pivoted arm, means for maintaining suitable longitudinal position of the gage by means of the arm and means for shifting the arm vertically.

11. A floating pile-gage having a pivoted arm and means for shifting said arm vertically.

12. A floating pile-gage having a pivoted arm, a lay, a projection upon the arm engaged by movement of the lay and means for shifting the arm vertically.

13. A floating pile-gage and means for intermittently moving the gage longitudinally.

14. A floating pile-gage having a pivoted arm and means for shifting said arm to permit weaving in either of the fabrics at will.

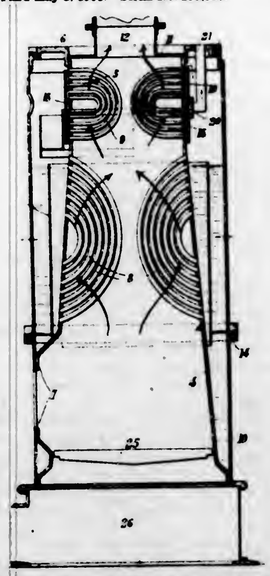
15. A floating pile-gage having a pivoted arm, a projection upon said arm, a lay causing engagement with said projection to produce longitudinal movement of the gage intermittently and means for varying the vertical position of the arm.

16. A longitudinally-movable pile-gage.

17. A pile-gage having an arm connected therewith and means for producing vertical and longitudinal movement thereof.

18. A pile-gage and means for producing intermittent positive partial withdrawal from the pile.

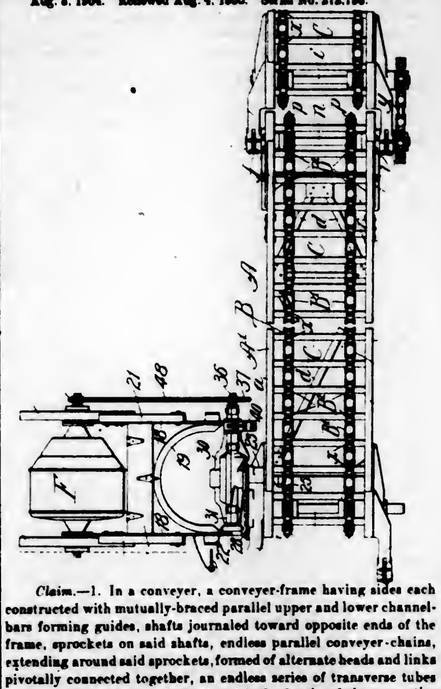
813,133. **STEAM-GENERATOR.** CHARLES P. ALTHANS, Lyon, France. Filed May 9, 1905. Serial No. 259,580.



Claim.—1. A steam generator and superheater comprising a cylindro-conical furnace provided with a set of steam-superheater tubes and a set of water-evaporator tubes, all bent in curves, the steam-superheater tubes being combined with partitions so as to cause the steam to pass successively through all the rows of tubes before escaping, a feed-tank being preferably arranged in the interior of the steam-space and discharging water outside a water-circulator diaphragm arranged between the furnace-wall and the outer casing substantially as described.

2. A steam-generator comprising a vertical outer casing and inner furnace-casing, sets of curved water circulating and evaporator tubes arranged within the furnace-casing and having their ends communicating with the space between the said outer and inner casings, sets of curved superheater-tubes similarly set in the upper part of the interior of the furnace-casing, partitions such as 18, 19 around the tube ends, and a feed-water tank adjacent to the superheater steam-tubes, substantially as described.

813,134. **CONVEYER.** CHARLES H. ANDERSON, Chicago, Ill. Filed Aug. 8, 1904. Renewed Aug. 4, 1905. Serial No. 273,796.



Claim.—1. In a conveyer, a conveyer-frame having sides each constructed with mutually-braced parallel upper and lower channel-bars forming guides, shafts journaled toward opposite ends of the frame, sprockets on said shafts, endless parallel conveyer-chains, extending around said sprockets, formed of alternate heads and links pivotally connected together, an endless series of transverse tubes connected toward opposite ends with the heads of the respective chains, shafts passing through and journaled in said tubes and movable at their ends in said guides, and driving means for the chains.

2. In a conveyer, a conveyer-frame having sides each constructed with mutually-braced parallel upper and lower channel-bars forming guides, shafts journaled toward opposite ends of the frame, sprockets on said shafts, endless parallel conveyer-chains, extending around said sprockets, formed of alternate heads and links pivotally connected together, an endless series of transverse tubes connected toward opposite ends with the heads of the respective chains, shafts passing through and journaled in said tubes, rollers on the ends of said shafts traveling in said guides, and driving means for the chains.

3. In a conveyer, a conveyer-frame having sides each constructed with mutually-braced parallel upper and lower channel-bars forming guides, shafts journaled toward opposite ends of the frame, sprockets on said shafts, endless parallel conveyer-chains, extending around said sprockets, formed of alternate heads and links pivotally connected together, an endless series of transverse tubes connected toward opposite ends with the heads of the respective chains, shafts passing through and journaled in said tubes provided at their ends with rollers moving in said guides, the lower said guides having extended portions to receive and direct the rollers into the lower guides, and driving means for the chains.

4. In a conveyer, an endless carrier comprising parallel chains formed with alternate links and heads, an endless series of transverse tubes connected toward opposite ends with the heads of the respective chains, and shafts extending through and beyond the ends of said tubes and journaled toward opposite ends in bearings in the tubes, the tubes forming oil-receptacles between the bearings therein.

5. In a conveyer, an endless carrier comprising parallel chains formed with alternate links and heads, an endless series of trans-

Claim.—1. In a metal-shaping machine, the combination with a suitable frame, pivoted forming-arms slidably mounted upon said

2. A water-heater comprising a vessel having an intermediate

be wound upon said roll, means to rotate said roll, and means to

5. In a conveyer, an endless carrier comprising parallel chains formed with alternate links and heads, an endless series of transverse tubes extending toward opposite ends through the heads of the respective chains, pins fastening the tubes in the heads, shafts extending through and beyond the ends of said tubes and journaled toward opposite ends in bearings in the tubes, and guides for the ends of said shafts.

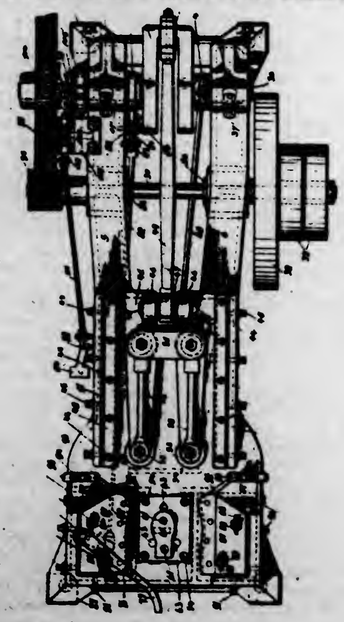
6. In a conveyer, the combination with a portable conveyer-frame, an endless traveling carrier thereon, and a drive-shaft on said frame for the carrier, of operating means therefor comprising a separately-portable electric motor having a frame, and means for pivotally connecting together and disconnecting said conveyer and motor-frames, substantially as and for the purpose set forth.

7. In a conveyer, the combination with a portable conveyer-frame, an endless traveling carrier thereon, and a drive-shaft on said frame for the carrier, of operating means for the carrier comprising a separately-portable electric motor, a wheeled truck-frame on which said motor is mounted, and means for pivotally connecting together and disconnecting said conveyer-frame and truck-frame, substantially as and for the purpose set forth.

8. In a conveyer, the combination with a portable conveyer-frame, an endless traveling carrier thereon, and a drive-shaft on said frame for the carrier, of operating means for the carrier comprising a separately-portable motor, hollow trunnions on the motor-casing through one of which the armature-shaft extends, truck-wheels journaled on said trunnions, a truck-frame pivoted to said trunnions, means for pivotally connecting together and disconnecting said conveyer-frame and truck-frame, and a detachable drive-belt connecting the armature-shaft and carrier drive-shaft.

9. In a conveyer, the combination with a portable conveyer-frame, an endless traveling carrier thereon and a shaft at one end of said carrier for driving the same, of a gear on said shaft, a counter-shaft journaled on the frame and having a pinion engaging said gear, a bevel-gear on said counter-shaft, a swinging frame pivotally mounted about the counter-shaft having attaching-arms, a drive-shaft extending through one of said arms and carrying a bevel-pinion meshing with said bevel-gear, and operating means for the carrier comprising a separately-portable motor, a wheeled truck-frame on which said motor is mounted, means for pivotally connecting said truck-frame to the said arms, and a detachable driving connection between the said motor and drive shaft.

813,185. **HORSESHOE-SHAPING MACHINE.** CHARLES ARBUTHNOT, McKees Rocks, Pa. Filed Feb. 16, 1905. Serial No. 245,873.

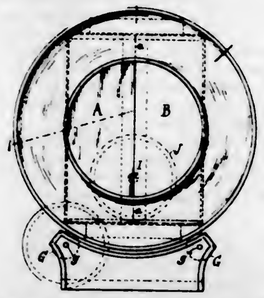


Claim.—1. In a metal-shaping machine, the combination with a suitable frame, pivoted forming-arms slidably mounted upon said frame, a detachable die, elevating mechanism mounted adjacent to said die, ejector mechanism carried by said frame, means to reciprocate said forming-arms, means to actuate said elevating mechanism, and means to operate said ejector mechanism substantially as described.

2. In a machine of the character described, the combination with a suitable frame, pivoted forming-arms slidably mounted on said frame, a stationary die and spring-pressed guiding-arms symmetrically converging toward and located adjacent to said die and adapted to guide a blank while it is being moved by the forming-arms toward the die.

3. In a machine for forming metal, the combination of reciprocating forming-arms adapted to engage a blank, a die around which said blank is adapted to be formed, vertically-movable pins to elevate said blank after it has been formed, and a horizontally-movable ejector to remove said formed blank from said die, substantially as described.

813,186. **TROPOSCOPE.** SAMUEL W. BALCH, Montclair, N. J. Filed May 11, 1905. Serial No. 260,641.



Claim.—1. The combination with a rotatably-mounted circular frame provided with an opening, of two plane mirrors set at right angles to each other with the straight edge of one of the mirrors meeting the other mirror and the meeting line of the mirrors opposite the opening in the circular frame, whereby the mirrors can be conveniently rotated about an axis perpendicular to the meeting line and the face of the frame, substantially as described.

2. The combination with a frame provided with an opening, of two plane mirrors set at right angles to each other with the straight edge of one of the mirrors meeting the other mirror and the meeting line of the mirrors opposite the opening in the frame, and a pivoted support for the frame, the axis of which is perpendicular to the meeting line of the mirrors and the face of the frame, substantially as described.

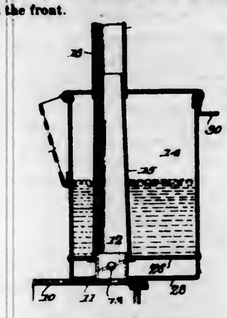
3. The combination with a circular frame provided with an opening, of two plane mirrors set at right angles to each other with the straight edge of one of the mirrors meeting the other mirror and the meeting line of the mirrors opposite the opening in the circular frame, and a pivoted support for the frame, the axis of which is perpendicular to the meeting line of the mirrors and the face of the frame, substantially as described.

4. The combination with a circular frame provided with an opening, of two plane mirrors set at right angles to each other with the straight edge of one of the mirrors meeting the other mirror and the meeting line of the mirrors opposite the opening in the circular frame, and means for rotating the mirrors about an axis perpendicular to the meeting line and face of the frame, substantially as described.

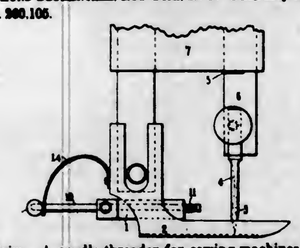
813,187. **HEATER ATTACHMENT TO STOVES.** REBIA BELL, Jacksonville, Fla., assignor of one-half to John Walker, Jacksonville, Fla. Filed May 1, 1905. Serial No. 258,220.

Claim.—1. A water-heater comprising a vessel having an intermediate vertical flue for connection at one end to the smoke-flue collar of a cook-stove and with the smoke-flue of the stove leading from the other end, the rear and end walls of the vessel extended below the bottom of the same and resting upon the stove, whereby a warming-chamber is provided between the vessel and stove and the bottom of the vessel protected from the direct radiation from the stove.

2. A water-heater comprising a vessel having an intermediate vertical flue for connection at one end to the smoke-flue collar of a cook-stove and with the smoke-flue of the stove leading from the other end, said flue being located relatively near the front of the vessel with the rear portion of the same extending rearwardly of the stove, and with the rear and end walls of the vessel extended downwardly and terminating in inwardly-extending flanges for engagement with the top of the stove, whereby a warming-chamber is provided between the vessel and stove, closed at the rear, bottom, and ends and open at the front.



813,138. **NEEDLE-THREADER FOR SEWING-MACHINES.** SIGMUND BLUMENTHAL, New York, N. Y. Filed May 12, 1905. Serial No. 260,105.



Claim.—A needle-threader for sewing-machines comprising a slightly-bent guide-tube mounted on the machine adjacent to the needle, a threader consisting of a straight, flattened wire, pointed at one end and having a substantially L-shaped opening near that end, adapted to enter and pass through the eye of the needle to engage the thread, said threader closely fitting and slidably secured in the bent guide-tube and means for indicating that the threader and eye of the needle are in operative alinement.

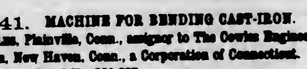
813,139. **FIRE-ESCAPE.** JOHN H. BROWN and CONSTANT FRANCEUS, Pittsburg, Pa. Filed Apr. 14, 1905. Serial No. 255,620.

Claim.—1. A fire-escape comprising a pivotally-mounted frame, rails slidably mounted upon said frame, secondary rails pivotally connected to the first-named rails, a roll journaled in the secondary rails, a flexible strip of material carried by said frame and adapted to be wound upon said roll, means to rotate said roll, and means to mount said fire-escape adjacent to a window, substantially as described.

2. A fire-escape comprising a plurality of frames adapted to fold upon one another, a strip of flexible material carried by said frames, means to retain said frames in extended position, and means to pivotally mount said fire-escape adjacent to a window of a compartment, substantially as described.

3. In a fire-escape, the combination with a window of a building, of a frame pivotally mounted within said building and adapted to be swung without said building, extension-frames carried by the first-named frame, a strip of flexible material carried by said frames, shields carried by said frames, a roll journaled in one of said frames and adapted to carry said material, and means to support said frames in an extended position, substantially as described.

813,140. **EYE FOR GARMENT-HOOKS.** TILLIE J. BROWNING, Philadelphia, Pa. Filed May 5, 1905. Serial No. 259,954.



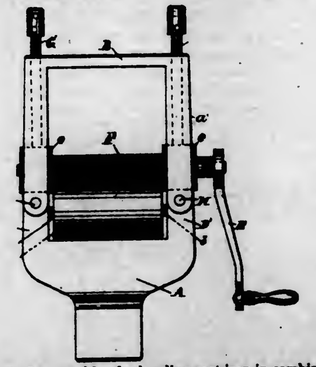
Claim.—1. An eye comprising a shank substantially straight in plan and a single loop at each end formed by an extension integral with the wire of the shank, said loops being approximately square in plan and the sides of the squares extending respectively substantially parallel with and at right angles to the direction of extension of the shank.

2. An eye formed of a continuous piece of wire formed at each end into a single loop and between its ends into a connecting-shank, each loop being composed of five bends extending, from the adjacent end of the shank, successively transversely, forwardly, transversely, backwardly and transversely, thereby forming a square-shaped loop with sides extending respectively substantially parallel with, and at right angles to, the direction of extension of the shank.

3. An eye consisting of a shank, and a single integral square-shaped loop at each end, each of which loops connects with the shank at a point substantially midway between one of the sides of the square.

4. An eye consisting of end loops connected by an integral shank, each loop extending, from its junction with the shank, successively transversely, forwardly, transversely, backwardly and transversely, the extreme end of the last or fifth bend extending in front of the shank and lying side by side with the wire at approximately the junction of the shank and loop.

818,141. **MACHINE FOR BENDING CAST-IRON.** BURTON S. COWLES, Plainville, Conn., assignor to The Cowles Engineering Corporation, New Haven, Conn., a Corporation of Connecticut. Filed Aug. 17, 1904. Serial No. 221,067.

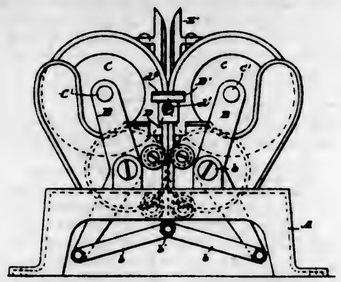


Claim.—1. In a machine for bending cast-iron in combination, a single supporting-roll and a bending-roll directly above the supporting-roll between which a rod of iron may be passed, the face of said bending-roll knurled, substantially as described.

2. In a machine for bending cast-iron in combination, a supporting-roll and a bending-roll of one-half the diameter of the supporting-roll, said bending-roll having its face knurled, substantially as described.

3. In a machine for bending cast-iron in combination, a supporting-roll, a bending-roll adjacent to the same whereby a bar of iron may be passed through and compressed between said rolls, said bending-roll of smaller diameter than the diameter of the supporting-roll and having its face knurled, substantially as described.

818,142. KNIFE-CLEANING MACHINE. CHARLES H. J. DILG, New York, N. Y. Filed Nov. 25, 1904. Serial No. 234,126.



Claim.—1. In a machine of the class described, a polishing-roll, in combination with a guide having jaws or members, and means for sustaining the latter so as to move relatively laterally and to hold the article to be treated in a relatively vertical position during said lateral movement and to be moved by the said article to accommodate and adjust itself to any variation of the said roll.

2. In a machine of the character described, a polishing-roll, in combination with a guide having jaws or members, and means for sustaining the latter so as to move relatively laterally and to hold the article to be treated in a relatively vertical position during said lateral movement, the said jaws or members having a slot or recessed portion formed in each of the opposite faces of the same.

3. In a machine of the character described, a polishing-roll, in combination with a guide having jaws or members, and means for sustaining the latter so as to move relatively laterally and to hold the article to be treated in a relatively vertical position during said lateral movement, the said jaws or members having lateral arms or extensions.

4. In a machine of the character described, a polishing-roll, and means for adjusting the position of the same, in combination with a relatively laterally movable guide for the article to be treated, and with means to hold the said guide in a normal median position.

5. In a machine of the character described, a polishing-roll, and means for actuating the same, in combination with a rest rotatable for purposes of adjustment, and means for locking the same in its different adjusted positions so as to present different portions of its face to the article to be treated.

6. In a machine of the character described, a polishing-roll, and means for actuating the same, in combination with a rest and means for adjusting the same either revolubly or vertically.

7. In a machine of the character described, a rest for the article to be treated, provided with an elevation located at the edge of the said rest and lying intermediate the face of the said rest and the said article.

8. In a machine of the character described, a movable rest for an article to be treated, and a roller to guide the movement of the said rest.

9. In a machine of the character described, a polishing-roll, and means for actuating the same, in combination with a rest for an article to be treated, and a roller to guide the movement of the said rest, and means for adjusting the rest either revolubly or vertically.

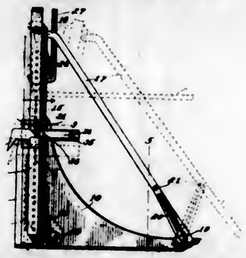
10. In a machine of the character described, a cleaning device consisting of two rotatable parts, and means to rotate the same, and flexible or yielding means intermediate the rotating means and the cleaning device to permit the relative positions of the faces of the said cleaning device to be changed at will.

11. In a machine of the character described, a polishing-roll, and means to sustain the same in a rotatory relation and provided with a bearing swiveling or turning so that the said roll may be adjusted either horizontally or laterally or in a vertical direction at will.

12. In a machine of the character described, a polishing-roll, in combination with an oscillatable guide having fixed members to permit the article to be treated to pass freely between the same and to accommodate and adjust itself to any variation of the position of the said article.

13. In a machine of the character described, a polishing-roll, in combination with a guide having jaws or members, and means for sustaining the latter so as to move relatively laterally and to hold the article to be treated in a relatively vertical position during said lateral movement, the said guide having means to prevent the article to be treated from being inserted in the machine alongside or exterior of the said guide.

818,143. DOG FOR SAWMILL-CARRIAGES. MAURICE S. BEY, New Orleans, La., assignor of one-half to Albert H. Thompson, Patterson, La. Filed Aug. 10, 1904. Serial No. 220,238.



Claim.—1. In a sawmill-carriage dogging mechanism, in combination, a knee, a yieldingly-braced dogging-frame pivoted to the knee, its pivot being back of the line of its face.

2. In a sawmill-carriage dogging mechanism, in combination, a knee, a dogging-frame pivoted to the knee, a jointed brace pivoted to the knee and to the dogging-frame, such brace being stopped from bringing its joint into line with its pivots.

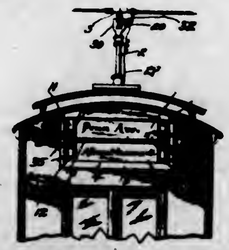
3. In a sawmill-carriage dogging mechanism, in combination, a knee, a dogging-frame pivoted to the knee, its pivot being back of the line of its face, a jointed brace pivoted to the knee and to the dogging-frame, such brace being stopped from bringing its joint into line with its pivot.

4. In a sawmill-carriage dogging mechanism, in combination, a knee, a swinging frame pivoted to the base of the knee, its pivot being back of the line of its face, a dog-carrying bar in sliding engagement with the frame, a lever pivoted to the frame and to the bar, and a jointed brace pivoted to the frame and to the knee, such brace flexing backwardly and being stopped against bringing its joint into line with its end pivots.

5. In a sawmill-carriage dogging mechanism, in combination, a knee, a swinging frame pivoted to the base of the knee, a dog carried by the frame, and a jointed brace in the plane of the dog, pivoted to the frame and to the knee.

6. In a sawmill-carriage dogging mechanism, in combination, a knee, a dogging-frame pivoted to the side of the knee, and a yoke-strap fitting over the knee and having one end thereof secured to the dogging-frame, its free end being pivoted to the knee in line with the frame-pivot.

818,144. STREET-CAR INDICATOR. DAVID C. EVANS and OLIVER Q. PATTERSON, Uniontown, Pa. Filed Sept. 6, 1905. Serial No. 277,264.



Claim.—1. In an indicator, the combination with a street-car, of a casing mounted within said car, inclined tracks carried at each end of said casing, guides mounted in said tracks, movable plates carried by said guides, toothed wheels revolubly mounted in said casing, and adapted to engage said plates, means for sustaining said plates in engagement with said toothed wheels, means for temporarily holding said plates in vertical position while engaged by the wheels, said last-named means being adapted to permit the plates to be successively released so as to turn over by gravity and reverse their position, an electromagnet mounted in said casing and adapted to actuate said wheels, means to intermittently energize said electromagnet, means for causing said plates to move into engagement with said wheels and means arranged within the casing to sound an alarm each time the indicator is actuated.

2. An indicator of the type described, comprising in combination a casing having an open front, inclined tracks mounted in said casing, guides carried by said tracks, plates movable by gravity in said guides, toothed wheels journaled in said casing and adapted to successively engage each of said plates, means to hold said plates in engagement with said wheels, means to sustain each plate temporarily in vertical position while engaged by the wheels, said last-named means being adapted to permit of the plates being successively released so as to permit them to reverse their positions by gravity while engaged by said wheels and means to actuate said wheels.

818,145. SAFETY-VALVE. CHARLES J. FANCHER, West Granby, Conn., assignor to The Simplex Manufacturing Company, New York, N. Y., a Corporation of Connecticut. Filed Mar. 9, 1905. Serial No. 249,230.

Claim.—1. A device of the class specified, consisting of a body having a through-passage therein, a valve adapted to normally close one end of said passage, a spring arranged crosswise of and in engagement with said valve and having lateral engagement with said body, said spring being adapted to normally retain the valve in its closed position, and means of connection between the spring and valve to prevent the latter from rotating or turning.

2. The combination, in a device of the class specified, with a body having a through-passage therein, of a valve, and a coiled spring provided with laterally-extending arms adapted to engage said body while the coil engages said valve to normally retain it in its closed position at one end of said passage.

3. The combination, in a device of the class specified, with a body having a through-passage therein and provided with upwardly-extending arms, of a valve, and a coiled spring having laterally-extending arms adapted to engage the arms of the body while the coil engages said valve to normally retain it in its closed position at one end of said passage.

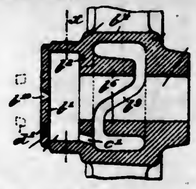
4. The combination, in a device of the class specified, with a body having a through-passage therein, of a valve recessed at the top, and a coiled spring having laterally-extending arms adapted to engage said body while the coil is received into the recess in said valve to prevent the valve from turning and to normally retain the same in its closed position at one end of said passage.

5. The combination, in a device of the class specified, with a body having a through-passage therein and a valve-seat at each end of said passage and provided with upwardly-extending arms, of a main valve, a coiled spring having laterally-extending arms to engage the first-mentioned arms while the coil engages said valve to normally retain it on its seat, a spindle extending from the main valve through and beyond the passage, and an auxiliary valve on the inner end of said spindle, said auxiliary valve being adapted to contact with its seat only upon the abnormal release of the main valve.

6. The combination, in a device of the class specified, with a body having a through-passage therein and a valve-seat at the outer end of said passage and provided with valve-guides rising from said body around said valve-seat, of a valve operating within and guided by such guides, and a spring connected with the body to normally retain said valve on the valve-seat, said spring being arranged crosswise and in engagement with the valve and having lateral engagement with the body.

7. The combination, in a device of the class specified, of a body having a through-passage therein and provided with upwardly-extending arms, a valve for one end of said passage, and a coiled spring provided with laterally-extending arms adapted to be connected with and disconnected from the first-mentioned arms, the coil of said spring bearing against said valve which latter is normally retained in its closed position by the spring.

818,146. MODE OF PRODUCING SELF-LUBRICATING CAR-WHEELS. JAMES W. FULLER, Jr., Catasauqua, Pa. Filed Sept. 16, 1905. Serial No. 278,288.



Claim.—1. The mode of forming a self-lubricating car-wheel which consists in first forming a wheel having a hollow hub portion composed of vertical and horizontal walls integral with each other and dividing the hub into two annular communicating chambers and a single chamber arranged at a right angle thereto; then forming openings in one of the outer and in the intermediate of said vertical walls of the hub so as to connect said single chamber with the outer of said annular chambers, then closing the openings formed in one of the outer walls so as to render the same liquid-proof up to a central opening cast therein, to permit of the filling of the single chamber with a lubricant up to the central opening, and of the flow of the lubricant from the single chamber into the outer annular chamber and from thence into the inner annular chamber of the hub when the wheel occupies an operative or vertical position.

2. The mode of forming a self-lubricating car-wheel, which consists in first casting a wheel having a hollow hub portion, composed of three vertical and two horizontal walls, dividing the hub into two annular chambers connected with each other by an annular opening formed in one of said horizontal walls separating said chambers from each other, and into a single chamber arranged at a right angle thereto and communicating with one end of the inner annular chamber, and with the exterior of the hub by an opening formed in one of the vertical walls and centrally to said inner annular chamber, then drilling holes through said outer perforated vertical wall and through the intermediate of said vertical walls so as to connect said outer annular chamber with said single chamber, then plugging the holes formed in the outer perforated vertical wall to close the openings drilled therein, to form a chamber capable of receiving a lubricant up to said central opening and to permit the same to flow into said outer annular chamber and from thence by said annular opening into said inner annular chamber or an axle placed therein when the wheel occupies a vertical or operative position.

818,147. METHOD OF TREATING OXIDIZED TINNED SHEETS OR SURFACES. STANLEY K. GUESS, Baltimore, Md. Filed Sept. 29, 1905. Serial No. 280,769. (Specimens.)

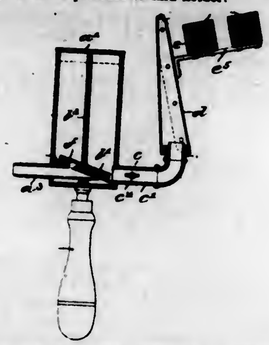
Claim.—The method herein described which consists in subjecting oxidized or otherwise corroded tinned sheets to the action of a bath consisting substantially of molten lead in the presence of a suitable flux.

818,148. MAGNESIUM FLASH-LAMP. EDWARD F. HARRISON, Philadelphia, Pa. Filed Nov. 23, 1905. Serial No. 288,495.

Claim.—1. A magnesium flash-lamp, comprising a holder for ignitible material, a pipe leading into said holder, a disk in contact with the inner portion of said pipe and having a stem to permit of a weight to be slid along the same, a vertically-arranged tapering device located adjacent to said holder and in communication therewith by means of pipe-sections and provided in the upper end with an oblong slit, said device adapted to permit of a thorough commingling of admitted air and ignitible material therein prior to discharge of the same through the slit of said device, burners located in proximity to said device and supported therefrom and means for presenting air under pressure to said holder.

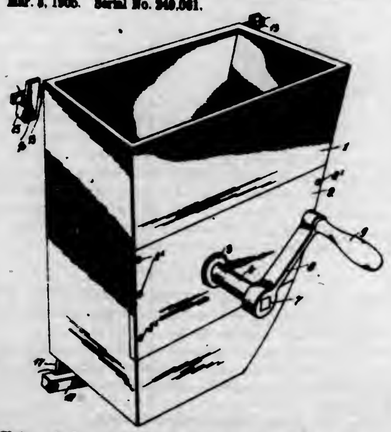
2. A magnesium flash-lamp, comprising a holder, a pipe leading into said holder having the inner end cut away, a recessed disk with a stem mounted in said holder and spanning the end of said pipe, said stem adapted to permit of a weight sliding thereon, a device with a slitted top connected with said holder by pipe-sections, in one of which sections is provided a check-valve, said device adapted to

permit of a thorough commingling of air and ignitible material therein prior to discharge through the slitted top thereof, burners located adjacent to said device and supported therefrom, and means for presenting air under pressure to said holder.



3. A magnesium flash-lamp, comprising a vertical holder, wherein air is admitted about the point of discharge of ignitible material, movable means in said holder to permit of the forcing of said ignitible material under pressure therefrom, a vertically-arranged tapering device provided with an oblong slit in the top thereof, said device supported from said holder and wherein air and ignitible material from said holder under pressure therefrom is thoroughly commingled therein prior to discharge from said device into the path of burners supported from said device, and means for presenting air to said holder.

813,149. **ICE-CRUSHER.** OTTO HARSCH, Swissvale, Pa. Filed Mar. 8, 1905. Serial No. 249,061.

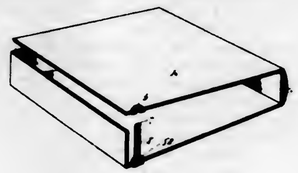


Claim.—1. In a device of the character described, the combination of a receptacle having one side prolonged below the bottom of the receptacle, and a cleat carried by the receptacle near its top edge, with a slotted bar adapted to be secured to a stationary support, said slotted bar receiving the prolonged side of said receptacle and brackets adapted to be attached to said stationary support to receive said cleat.

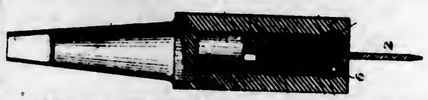
2. In a device of the character described, the combination with a receptacle, of a shaft mounted in bearings carried by the sides of the receptacle, tapering pointed prongs carried by said shaft, one of said prongs being of less length than all the other of said prongs and disposed in circumferential alinement with one of the longer prongs, and a crank and handle carried by said shaft, substantially as described.

813,150. **FILING-GAGE.** CHARLES O. HERSCH, Valparaiso, Ind. Filed May 31, 1904. Serial No. 210,333.

Claim.—In combination with a back piece with convexed surface, the same being in turn divided into a plurality of transversely-extending sections, a hinged piece attached to a lateral edge thereof, a bottom piece rigidly attached to the other lateral edge, end pieces rigidly attached to each terminal edge and to said bottom piece, a closure-piece secured to the free edge of said bottom piece and to the adjacent edges of said end pieces, and a post rising from a point in said bottom piece adjacent to its line of union with said closure-piece, and adapted to engage said hinged piece, substantially as described.



813,151. **DRILL-CHUCK.** THOMAS JAMES, Braddock, Pa. Filed Nov. 10, 1904. Serial No. 232,300.



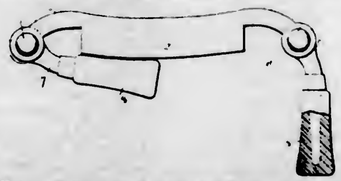
Claim.—1. A drill-chuck, comprising a socket, a removable bushing in the socket, and means in the bushing for adjusting the drill; substantially as described.

2. A drill-chuck comprising a socket, a removable bushing having oppositely-facing shoulders in said socket, means in the bushing for adjusting the drill, a transverse slot in the socket, and means extending through the slot and on both sides of the drill for holding the drill and bushing in the socket; substantially as described.

3. A drill-chuck comprising a socket, a removable bushing having oppositely-facing shoulders, in the socket, a transverse slot in the socket and means extending through the slot and on both sides of the drill for holding the drill and bushing in the socket; substantially as described.

4. A drill-chuck comprising a socket, a removable bushing having oppositely-facing shoulders in the socket, a transverse slot in the socket and a forked wedge extending through the slot and on both sides of the drill for holding the drill and bushing in the socket; substantially as described.

813,152. **DRAW-KNIFE.** ARCHER B. JENNINGS, Yalesville, Conn. Filed June 26, 1905. Serial No. 267,037.



Claim.—1. The therein-described draw-knife comprising a blade, a shank at each end, said shanks terminating in flat disks in the plane of said shanks, handles comprising shanks and disks, grips secured to said shanks, angular openings in the said disks, angular clamping-bolts passing through said disks whereby they may be locked together the exterior surface of the grips curved corresponding to the curvature of the cutting edge of the blade and adapted and arranged to be turned toward the blade and locked in close relation thereto but slightly separated therefrom, substantially as described.

2. The herein-described draw-knife comprising a blade, a shank at each end, said shanks terminating in disks in the plane of said shanks, handles comprising shanks and disks, and grips secured to said shanks the exterior surface of said grips curved corresponding to the curvature of the cutting edge of the blade, said blade-disks and handle-disks formed with angular tapered holes, the holes in the handle-disks being of different pitch from the holes in the blade-disks, and bolts passing through said holes and adapted to clamp the disks together said bolts having tapered portions fitting the taper

in the said disks whereby the handles may be locked in various positions of adjustment one of which is inward toward the blade from which they are held slightly separated, substantially as described.

813,153. **FISHING-FLOAT.** LESLIE M. JOHNSON, East Providence, R. I. Filed Aug. 26, 1905. Serial No. 276,016.

Claim.—1. As an improved article of manufacture, a fishing-float comprising an ellipsoidal body member *a*, an eye or line-guide mounted in one end thereof and a peripheral spring-clip secured to said body and located substantially midway of it, the jaws or yielding sides of said clip member being parallel with the longitudinal axis of the body and extending perpendicularly above the latter, the upper portion of the clip and the outer end of the eye member being in alinement with each other and with a point in the intermediate peripheral surface of the body, substantially as shown and described.

2. The fishing-float A herein described, consisting of the ellipsoidal-shaped body member *a*, the self-closing hook or line-guide *b* rigidly secured in one end of said body, and the clip *c* having parallel yielding sides, said clip being secured to the body member and projecting radially from the surface thereof at its maximum transverse diameter, the top or free end of the clip being in alinement with said guide *b* and having that portion of the surface of the body lying between said guide and clip members substantially below a straight line passing through said members.

3. A fishing-float comprising an ellipsoidal-shaped body *a*, an eye member secured in the center of one end of the body, and a spring-clip rigidly secured to and located centrally of the length of the latter and projecting upwardly or outwardly therefrom; the length of the clip being such that its upper or free end is adapted to intersect a straight line passing through said eye and being tangent to the adjacent surface of the body, substantially as described.

813,154. **AUTOMATIC SWITCH FOR ELECTRIC RAILWAYS.** VINCENZ JOSSEK, Karlin-Prague, and JOSEF PERFIX, Prague, Austria-Hungary, assignors of one-third to Richard Butta, Prague, Austria-Hungary. Filed May 26, 1905. Serial No. 262,427.

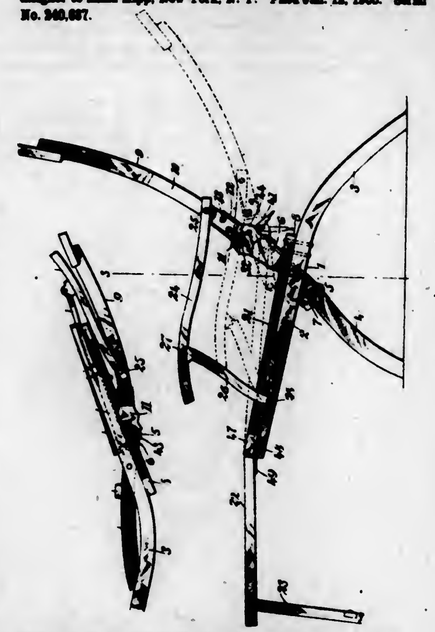
Claim.—The combination with the main conductor, an electrically-driven vehicle, and the main contact device carried by the latter, of two other conductors 6 and 7 arranged parallel with the main conductor, a switch-actuating part, separate magneto-electric devices controlling said part, said conductors 6 and 7 being each connected with one of said magneto-electric devices, a switch on the vehicle in permanent electric connection with the main contact device, curved spring-actuated contact devices pivoted in the main contact device and engagable each in its curved portion with one of the conductors 6 and 7, and conductors connected each to one of said spring-actuated contact devices and extending into contactible proximity to said switch, substantially as described.

813,155. **RED AZO DYE AND PROCESS OF MAKING SAME.** GUSTAV KALLENBERG, Frankfort-on-the-Main, Germany, assignor to Consolidated Color Company, New York, N. Y. Filed Aug. 21, 1905. Serial No. 274,169.

Claim.—1. The process of preparing red azo dyes by combining in alkaline solution one molecule of an aromatic diazo compound with one molecule of the 5.oxynaphthe diamidobenzmidehydin.7.-sulfo-acid.

2. The coloring-matters obtained by combining in alkaline solution one molecule of an aromatic diazo compound with one molecule of the 5.oxynaphthe diamidobenzmidehydin.7.sulfo-acid, the coloring-matters being in the dry state red powders of a metallic said luster, soluble in water with a yellowish-red to bluish-red color, dissolving in concentrated sulfuric acid with a bluish-red color, substantially as described.

813,156. **RECLINING-CHAIR.** LEONARD KIPP, Waterbury, Conn., assignor to Anna Kipp, New York, N. Y. Filed Jan. 12, 1905. Serial No. 240,687.



Claim.—1. In a chair of the class described, in combination, a body having side bars, the rear portions thereof constituting rear legs, forward legs making a pivotal connection with said side bars, a body making a pivotal connection with the upper extremities of said forward legs, said body having spurs projecting inwardly and moving therewith, a seat supported upon said body forwardly and supported upon said spurs toward the rear, arms pivotally attached to the sides of said back, links pivotally connecting said arms forwardly with said side bars, and means for locking said back in a plurality of positions.

2. In a chair of the class described, an adjustable connection comprising, in combination, a ratchet, a pair of pawls projecting in opposite directions and engaging the teeth of said ratchet, a connection between said pawls whereby they move simultaneously, a spring constraining said pawls to engage said ratchet, and a lever for disengaging them from said ratchet.

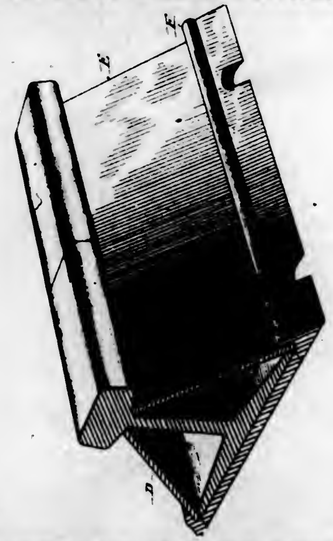
3. In a chair of the class described, an adjustable connection comprising, in combination, a ratchet, a pair of pawls, the bodies whereof project toward each other and the points whereof engage said ratchet, said pawls having fingers projecting therefrom, a plunger engaging said fingers, a spring constraining said plunger to maintain said pawls in engagement with said ratchet, and a member adapted to disengage said pawls.

4. In a chair of the class described, an adjustable connection comprising, in combination, a socket-head presenting a ratchet, a pair of oppositely-disposed pawls projecting toward each other and engaging the teeth of said ratchet, said pawls having adjacently-disposed fingers, a plunger disposed between said fingers and engaging same to operate said pawls, and a member adapted to move said pawls.

5. In a chair of the class described, an adjustable connection comprising, in combination, a socket-head presenting a ratchet, a pair of oppositely-disposed pawls engaging the teeth of said ratchet and projecting toward each other, said pawls having adjacently-disposed fingers with opposite recesses, a plunger having a reduced neck received in said recesses, and means for actuating said pawls.

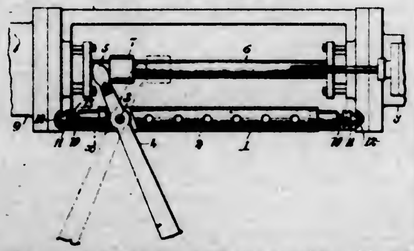
6. In a chair of the class described, an adjustable connection comprising, in combination, a socket-head presenting a ratchet, a pair of oppositely-disposed pawls engaging the teeth of said ratchet and having adjacently-disposed fingers with recesses therein, a plunger having a reduced neck received in said recesses, a spring constraining said plunger to maintain said pawls in contact with said ratchet, and a lever adapted to actuate one of said pawls, operating through said plunger to release the other of the said pawls.

813,157. **DEVICE FOR SPLICING T-RAILS.** WILLIAM B. KNIGHT, Bellefontaine, Ohio. Filed June 3, 1905. Serial No. 263,667.



Claim.—The chair A, having seats B, C, and the wedges or side plates D, E, their upper ends bearing against the under side of the ball of the rail, and the lower ends resting on the chair, and against the outside bottom edge of the rail, as and for the purpose set forth.

813,158. **PISTON-ROD-MOVING DEVICE.** HANS LISKER, New York, N. Y. Filed Dec. 21, 1905. Serial No. 292,748.



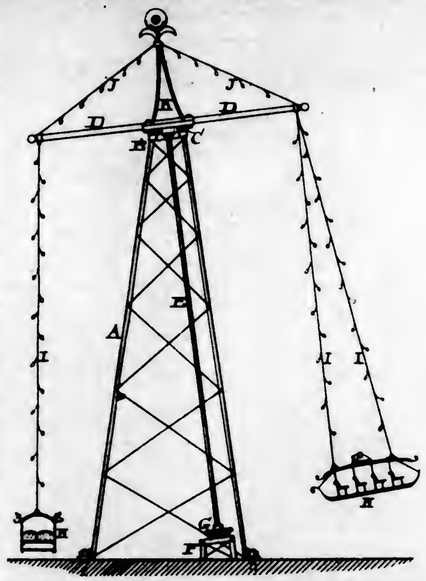
Claim.—1. A piston-rod-moving device, comprising a fulcrum-bar, an adjusting-screw at the end thereof, a fulcrum-pin adjustable along the bar, and a lever mounted to swing on said pin.

2. A piston-rod-moving device, comprising a fulcrum-bar consisting of two spaced, perforated members, a pin for engaging in opposite perforations, and a driving-lever arranged to swing on said pin.

3. A piston-rod-moving device, comprising a fulcrum-bar, adjusting screw-bolts at the ends thereof, and a lever adjustable along the bar.

4. A piston-rod-moving device, comprising a longitudinally-slotted bar having transverse perforations, pointed adjusting screw-bolts at the end of the bar, a pin for engaging in opposite perforations, and a lever arranged to swing on said pin, the said lever having a bifurcated end.

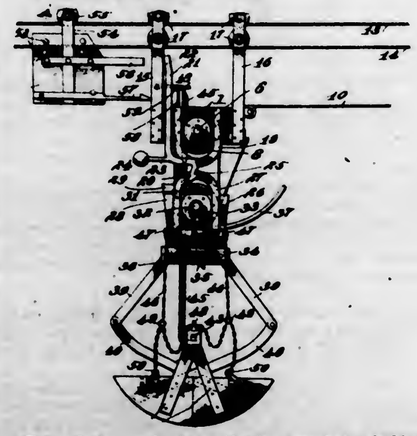
813,159. **MERRY-GO-ROUND.** TIMOTHY LONG, Cleveland, Ohio. Filed Nov. 30, 1904. Serial No. 234,898.



Claim.—1. In a merry-go-round, a tower formed of a plurality of legs of unequal length, an inclined table formed with a depending flange seating on the upper ends of said legs and having the flange thereof engaged by said legs, a rotatable spider on said table, and a shaft having its upper end projecting into said spider and secured thereto.

2. In a merry-go-round, a tower formed of a plurality of legs of unequal length, a table of ring-like form seating on the upper ends of said legs, a marginal depending flange carried by the table and being engaged by said legs, a rotatable spider seating on said table and having a central opening, a shaft having its upper end projecting through said table and secured in said opening of the spider.

813,160. **CARRIER.** DWIGHT G. LYMAN, Omaha, Nebr. Filed Aug. 4, 1905. Serial No. 272,694.



Claim.—1. In a carrier, in combination, a carriage; a locking-latch pivoted thereon; a stop-block; two projecting hooks on the stop-block adapted to be engaged by the latch; a bucket movably supported with relation to said carriage; and a releasing-rod carried by the bucket, adapted to be projected upward between said hooks to disengage said latch and hooks.

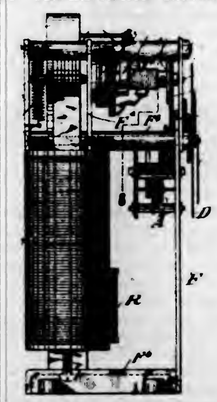
2. In a carrier, in combination, a carriage; means for locking said carriage upon a way; a hoisting-head releasably connected with said carriage; an operating-head releasably connected with said hoisting-head; a bucket connected with said hoisting-head and said operating-head; and means carried by said bucket for operating said locking means.

3. In a carrier, in combination, a carriage; a stop-latch pivoted on said carriage; a stop-block for said carriage, said block having a hook adapted to engage said latch; a hoisting-head releasably connected with said carriage; a bucket connected to said hoisting-head but arranged to have a vertical movement with relation thereto; and a releasing-rod vertically movable with said bucket, the upper portion of said rod extending through said hoisting-head into position to engage said latch for disengaging said latch and said hook.

4. In a carrier, in combination, a carriage; means for locking said carriage upon a way; a hoisting-head releasably connected with said carriage; an operating-head releasably connected with said hoisting-head; a bucket connected with said hoisting-head and said operating-head; and a releasing-rod connected to move with said bucket, said rod extending through said operating-head and hoisting-head into position to operate the carriage-locking means.

5. In a carrier, in combination, a carriage; a stop-latch pivoted on said carriage; a stop-block having a hook adapted to engage said latch; a hoisting-head suspended from said carriage; and a rod depending from said latch into position to be raised by said head for operating said latch.

813,161. **SELF-WINDING ELECTRIC CLOCK.** MAX MENKIN, New York, N. Y. Filed Mar. 30, 1904. Serial No. 200,776.



Claim.—1. A self-winding attachment for clocks, consisting of a supporting-frame formed of front and rear plates and connecting-pillars, a clock-train, a dial and hands therefor supported by one of the plates, an intermediate plate interposed between the front and rear plates and supported by said pillars, an electromagnet, an armature for the same, spring-actuated pawls on the armature, a shaft for the armature journaled in the intermediate and rear plates, an arbor journaled in the intermediate and front plates, a pinion at one end of the arbor engaging the clock-train, a plate secured to the pinion of the arbor and provided with a contact-terminal, a ratchet-wheel movable on the arbor and adapted to be engaged by the pawls of the armature, a contact-terminal supported by the ratchet-wheel, a motor-spring having its ends secured to the arbor and to the ratchet-wheel, a source of electricity, and conductors electrically connecting the electromagnet, source of electricity and contact-terminals.

2. In a self-winding attachment for clocks, the combination of a mainspring, a shaft in connection with the inner end of the mainspring, a movable member connected with and operated by the shaft, a second movable member connected with and operated by the outer end of the mainspring, a source of electricity, a contact-terminal for each member, each connected with one pole of the source of electricity, and a lintel-shaped projection on the second member in close proximity to the contact-terminal thereon, the major axis of the projection and the direction of movement of the contact-terminal of the first member being in obliquity to each other, the projection being adapted to gradually tension the contact-terminal of the first member on its approach to the contact-terminal of the second member, release the so-tensioned contact-terminal of the first member, at the end of its path thereon, so as to cause it to forcibly contact with the contact-terminal of the second member, and adapted to act as a guide and cause the contact member of the first member to be tensioned when the same passes between it and the contact-terminal of the second member.

3. A self-winding attachment for clocks, comprising a mainspring, a shaft connected with the mainspring, a movable member secured to the shaft, a second movable member connected with and operated by the outer end of the mainspring, a lintel-shaped projection on one of said members, a source of electricity, and a contact-terminal for each movable member, connected with a pole of the source of electricity, the contact-terminal on the member supporting the projection being in proximity to and conforming substantially to the contour of the projection, while the contact-terminal of the other movable member is provided with an end adapted to pass along the projection.

4. In a self-winding attachment for clocks, the combination of a mainspring, a shaft in connection with the inner end of the mainspring, a movable member connected with and operated by said shaft, a second movable member connected with and operated by the outer end of the mainspring, a lintel-shaped projection on one of said members, a source of electricity, and a contact-terminal for each member, each connected with a pole of the source of electricity, one of said contact-terminals being provided with an end conforming substantially to the contour of the lintel-shaped projection and the other of said contact-terminals being provided with an end adapted to pass along the projection, said end being at an angle to the other contact-terminal when in contact therewith.

5. In a self-winding attachment for clocks, the combination of a mainspring, a shaft in connection with the inner end of the mainspring, a movable member connected with and operated by the shaft, a second movable member connected with and operated by the outer end of the mainspring, and contact-terminals, one on each member, each connected with a pole of a source of electricity and each yieldingly supported and each adapted to be resiliently strained when in electrical connection with the other, said contact-terminals being so arranged that the contact-terminal of the first member gradually approaches the contact-terminal of the second member, until it contacts with the same, after which the contact-terminal of the second member moves away from the contact-terminal of the first member.

6. In a self-winding attachment for clocks, the combination of a fixed supporting-plate connected with one pole of a source of electricity, a plate secured to the supporting-plate but insulated therefrom, having a central opening and connected with the other pole of a source of electricity, a collar on said insulated plate, a shaft pivotally supported by the supporting-plate, passing through the central opening of the insulated plate but not in contact therewith, a contact-terminal movable with said shaft, a ratchet-wheel movable in respect to the shaft, a contact-terminal on the ratchet-wheel insulated therefrom but in electrical connection with the collar on the insulated plate, a lintel-shaped projection on the ratchet-wheel in proximity to the end of the last-named terminal, and a motor-spring connecting the shaft and the ratchet-wheel.

7. In a self-winding attachment for clocks, the combination of a mainspring, a shaft in connection with the inner end of the mainspring, a member connected with and operated by the shaft, a second member connected with and operated by the outer end of the mainspring, means adapted to periodically tension the mainspring, and means on each of said members projecting laterally therefrom, adapted when in engagement with each other, after a partial unwinding of the mainspring but with the mainspring still under tension, to limit the movement of the members so as to prevent the further unwinding of the mainspring.

8. In a self-winding attachment for clocks, the combination of supporting-plates, a shaft pivotally supported by said supporting-plates, a movable member secured to said shaft, a banking-rod on said member, a second movable member rotatable on said shaft, a banking-blade on said second member, adapted to arrest the movement of the banking-rod, a motor-spring having its ends connected with the members, and contact-terminals on each of said members.

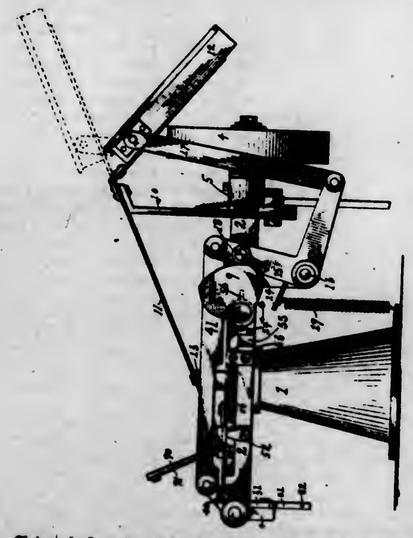
9. In a self-winding attachment for clocks, the combination of a mainspring, a shaft carrying the inner end of the mainspring, a member connected with and operated by the shaft, a second member connected with and operated by the outer end of the mainspring, a source of electricity, contact-terminals on said members each connected with a pole of the source of electricity, a lintel-shaped projection on one of said members in proximity to the contact-terminal

thereon, a banking-rod on one member, and a banking-blade on the other adapted to arrest the movement of the banking-rod.

10. In a self-winding attachment for clocks, the combination of supporting-plates, a shaft pivotally supported by said supporting-plates, a movable member secured to said shaft, a banking-rod detachably secured to said member, a second movable member rotatable on said shaft, a banking-blade on said second member adapted to arrest the movement of the banking-rod, a motor-spring having its ends connected with the members, a contact-terminal on each of said members, a collar secured to one of said supporting-plates but insulated therefrom, a brush on the second member in electrical connection with the collar and with the contact-terminal on said member, a source of electricity, and means connecting said collar and the contact-terminal of the first member with the poles of said source of electricity.

11. In a self-winding attachment for clocks, the combination of an electromagnet, a source of electricity, an electrical connection between said magnet and said source of electricity, a plurality of supporting-plates supported by the poles of the electromagnet, an armature movable between the poles of the electromagnet, a shaft for the armature journaled in two adjacent supporting-plates, means between the two other adjacent plates adapted to close the electric circuit of the electromagnet for actuating the armature, means for returning the armature to its normal position, and means for limiting the return movement of the armature.

813,162. **NAIL AND RIVET DELIVERING MACHINE.** JOHN A. HILLIERS, New York, N. Y., assignor, by mesne assignments, to The Schoour Factory, a Corporation of New York. Filed Apr. 23, 1904. Serial No. 204,867.



Claim.—1. In a rivet-delivering machine, the combination of a platform; a feeding device thereon; a rock-shaft on the platform; holder-jaws on said shaft; means for rocking the shaft to present the holder-jaws to the feeding device and return them to their initial position; and means for rigidly securing the rivets in the holder-jaws.

2. In a rivet-delivering machine the combination of a platform; a feeding device thereon; a slide-block on one side thereof; a rock-shaft on the platform; a driven shaft; cams on said driven shaft; holder-jaws on the rock-shaft; means actuated by one of said cams to oscillate the rock-shaft; means actuated by the other cam acting through the slide-block for opening the holder-jaws; and means for closing the holder-jaw.

3. In a rivet-delivering machine the combination of a platform; a feeding device thereon; slide-blocks on either side thereof; a rock-shaft on the platform; a driven shaft; cams on said shaft for actuating said slide-blocks and rock-shaft; holder-jaws on the rock-shaft; means actuated by one of the slide-blocks for opening the holder-jaws; means actuated by one of the cams to oscillate the rock-shaft and present the holder-jaws to the feeding device; means actuated by the other slide-block for feeding rivets to the open holder-jaws; and means for closing the holder-jaws.

4. In a rivet-delivering machine the combination of a platform; a slide-block on one side thereof; a rock-shaft on the platform; a shaft extending across the platform; cams on said shaft for actuating said slide-block and rock-shaft; holder-jaws on the rock-shaft; means actuated by one of the cams to oscillate said shaft and holder-jaws; and means actuated by the slide-block for feeding a rivet to the holder-jaws.

5. In a rivet-delivering machine the combination of a platform; slide-blocks on either side thereof; a rock-shaft mounted thereon; a driven shaft extending across the platform; cams on said shaft for actuating said slide-blocks and rock-shaft; a feed-chute on the platform; a hopper hinged at the upper end thereof; holder-jaws mounted on the rock-shaft; means actuated by one of the slide-blocks for opening the holder-jaws; means actuated by one of the cams for oscillating the rock-shaft, holder-jaws and hopper; means actuated by the other slide-block for feeding single rivets to the holder-jaws; and means for closing said jaws.

6. In a rivet-delivering machine the combination of a platform, a feeding device thereon; slide-blocks on either side thereof; a rock-shaft on said platform; cams for actuating said slide-blocks and rock-shaft, holder-jaws on the rock-shaft; means actuated by one of the slide-blocks for opening the jaws; means actuated by the other slide-block for feeding a rivet to the holder-jaws; means actuated by one of the cams for oscillating the rock-shaft and presenting the jaws to the feeding device; and means for closing the back of the holder-jaws, substantially as described.

7. A delivering-machine comprising a platform; a feed-chute thereon; slide-blocks on either side thereof; a rock-shaft on the platform; a driven shaft on the platform; cams on said shaft for actuating said slide-blocks and rock-shaft; holder-jaws on the rock-shaft; means actuated by one of said cams for oscillating said rock-shaft and jaws; a closure device at the lower end of the feed-chute operated by one of the slide-blocks; a finger operated by the other slide-block; means operated by the finger for opening the holder-jaws; and means for closing said jaws.

8. In a rivet-delivering machine the combination of a platform; a feed-chute thereon; slide-blocks on either side thereof; a rock-shaft on the platform; a driven shaft on the platform; cams on said shaft actuating said slide-blocks and rock-shaft; nicked holder-jaws on the rock-shaft; means operated by one of the cams to oscillate the rock-shaft and jaws; a closure device at the lower end of the feed-chute; a cut-off device for holding back the column of rivets in the chute, said closure and cut-off being actuated by one of the slide-blocks; a finger operated by the other slide-block; means operated by said finger for opening said jaws; and means for closing said jaws.

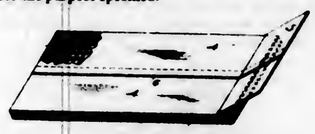
9. In a rivet-delivering machine, the combination of a platform; a feed-chute thereon; slide-blocks on either side thereof; a rock-shaft on the platform; a driven shaft on the platform; cams on said shaft for actuating said slide-blocks and rock-shaft; nicked holder-jaws on the rock-shaft; means operated by one of the cams to oscillate said rock-shaft and jaws; a closure device for the back of the nicked jaws; a spring-actuated closure device at the lower end of the feed-chute; a cut-off device for holding back the column of rivets in the chute; said closure and cut-off being actuated by one of the slide-blocks; means for opening the holder-jaws comprising a finger actuated by the other slide-block and engaging a pin bearing against one of the jaws; and means for closing said jaws.

10. In a holder for delivering-machines, the combination of pivoted jaws having nicks in their meeting faces; means for closing the back of said nicks; and means for removing said closing device when the jaws are in open position.

11. A holder for delivering-machines comprising a rock-shaft; two nicked jaws mounted thereon; a spring normally holding said jaws together; a spring on one jaw; a pin cooperating therewith; and extending across the back of the nicks; and means operating on the spring to withdraw the pin when the jaws are in open position.

813,163. **READY-MADE ROOFING.** WILLIAM J. MOELLER, Hartwell, Ohio, assignor to the Philip Carey Manufacturing Company, Lockland, Ohio, a Corporation of Ohio. Filed Apr. 18, 1904. Serial No. 203,703.

Claim.—A ready-made roofing consisting of a base portion, a cement body portion overlying the same, and a burlap portion partially embedded upon the top of the cement body portion, the transverse joints of said burlap portion being united by an adhesive cement strip interposed between the overlapping ends thereof, substantially as and for the purpose specified.



813,164. **ALARM.** WILLIAM L. MONROE, Omaha, Nebr. Filed May 26, 1904. Serial No. 209,716.

Claim.—1. The combination with a base, of a holder, an operating member mounted upon the base, a retaining projection on the base for the said operating member, and a releasing member carried by the base and having a projection which may extend over the operating member, to lock the same in an inoperative position.

2. The combination with a base, of a post extending therefrom between its ends, a hammer movable about the post, a holder and retaining projection situated at opposite ends of the base, and a releasing member for the hammer movably mounted adjacent to the retaining projection.

3. The combination with a base provided with an opening, of a tongue extending into the opening, a post situated in the opening and having a slot engaging the tongue, and a hammer movable about the post.

4. An alarm comprising a plate having flanges, a holder, a hammer pivoted upon the plate, guides situated between the flanges, and a member for coaction with the hammer mounted in the guides and having an enlargement which may contact with one of said guides.

5. An alarm comprising a plate having an opening, a holder carried by the plate, a hammer pivoted upon said plate, and a member mounted to slide upon the plate and being movable through the opening into coaction with the hammer.

6. An alarm comprising a plate, a holder carried by the plate, a hammer pivoted to said plate, and a member mounted to slide upon the opposite side of the plate from the hammer and having a projection which may contact with the outer face of the hammer.

7. An alarm comprising a plate having an opening, a holder carried by the plate, a hammer pivoted upon said plate, and a member mounted to slide upon the opposite side of the plate from the hammer and being movable through the opening into coaction with said hammer, this member having a projection which may contact with the outer face of the hammer.

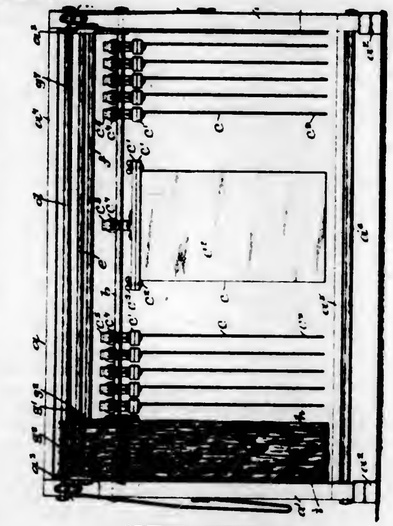
8. The combination with a base having an opening at one end, of a holder, an operating member pivotally mounted upon the base, a retaining projection on the base for said operating member, and a releasing member mounted to slide upon the base and movable through the opening in the base to engage and release the operating member.

813,165. **LACE-CURTAIN-EXHIBITING APPARATUS.** JOHN F. HUNFORD, Fall River, Mass., assignor of one-half to Frederick F. Fanning, Providence, R. I. Filed June 23, 1905. Serial No. 266,551.

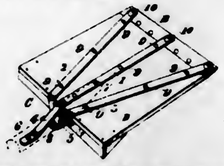
Claim.—1. An apparatus for exhibiting lace curtains comprising a frame, a track running lengthwise in the frame, a plurality of lace-curtain holders removably suspended from the track, each holder having clamping-bars, a shade secured to the lower clamping-bar, a hook-shaped frame pivotally secured to the upper clamping-bar, means for securing the clamping-bars together to clamp the end of a lace curtain between the same, and curtains on the frame adapted to inclose the lace-curtain holders, as described.

2. An apparatus for exhibiting lace curtains comprising a frame, a track secured at each end in the frame, a plurality of lace-curtain holders removably suspended from the track, each holder having two clamping-bars, a shade secured to the lower clamping-bar, a hook-shaped frame pivotally secured to the upper clamping-bar, a pulley rotatably secured in the hook-shaped frame, means for securing the clamping-bars together to clamp the end of a lace curtain between the bars, curtain-rods on the frame, and means for suspending top, side and end curtains from the curtain-rods and frame in a position to inclose the lace-curtain holders, as described.

3. In an apparatus for exhibiting lace curtains, the combination of a track *b* secured at each end in the apparatus and a lace-curtain holder *c* consisting of clamping-bars c' c' having at each end clamping-bolts c^3 c^3 with thumb-nuts c^3 c^3, a grooved pulley c^4, a hook-shaped frame c^5 having an L-shaped lower end c^6 pivotally secured by a loose rivet c^7 to a plate c^8 which is centrally secured to the top clamping-bar c', a shade c^9 secured at its upper end to the lower clamping-bar c', and means for rotatably securing the pulley c^4 in the hook-shaped frame c^5, whereby a lace curtain is secured to the holder *c* and the holder removably suspended from the track *b*, as described.

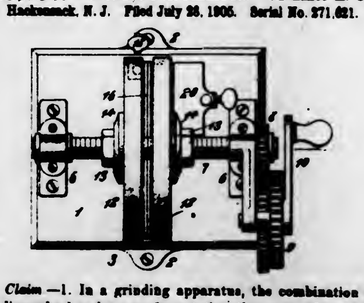


813,166. **SHOVEL.** JAMES B. NEWTON, Fall River, Mass. Filed Feb. 17, 1905. Serial No. 245,967.



Claim.—A shovel, consisting of a handle; a working edge portion; a rod connecting said working edge portion with said handle; a second rod whose free ends are connected with said working edge portion, and whose middle portion is bent and forms a loop for the reception, and the fastening thereto, of the shank of the shovel; and a scoop.

813,167. **GRINDING APPARATUS.** LEVERETT H. OLMSTED, Hackensack, N. J. Filed July 26, 1905. Serial No. 271,621.

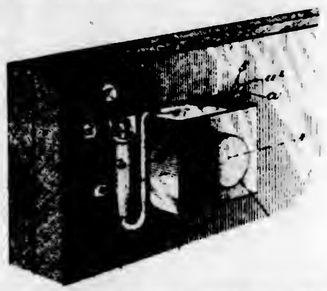


Claim.—1. In a grinding apparatus, the combination with a grinding-wheel and means for rotating the same, of an elongated rest the top whereof is arranged to engage the back of a knife-blade, preventing longitudinal rocking of the same while permitting the

blade to be moved longitudinally upon the rest, substantially as shown and described.

2. In a grinding apparatus, the combination with a pair of grinding-wheels and means for rotating the same, of an elongated rest located between the opposite vertical faces of the wheels, the seat of such rest being angular.

813,168. NUT-LOCK. JOHN PETRIE, Bothwell, Canada, assignor of two-thirds to Robert C. Russell, Arthur, Ontario, Canada. Filed June 26, 1905. Serial No. 267,401.



Claim.—1. A nut-lock comprising a plate having an opening to receive the bolt and having one of its ends bent laterally to form a projection, and having upon its other end a tubulation, a dog comprising an arm rotatably mounted on the tubulation and an arm for engaging the side of the nut, and a washer beneath the plate having a laterally-bent end to be engaged by the bent end of the plate.

2. A nut-lock comprising a plate having an opening to receive the bolt and having one of its ends bent laterally to form a projection for engaging the material through which the bolt is passed, whereby to prevent rotation of the plate, and having upon its other end a tubulation, and a dog comprising an arm rotatably mounted in the tubulation and an arm for engaging the side of the nut, the arm within the tubulation being provided with an ear whereby to limit the motion of the dog.

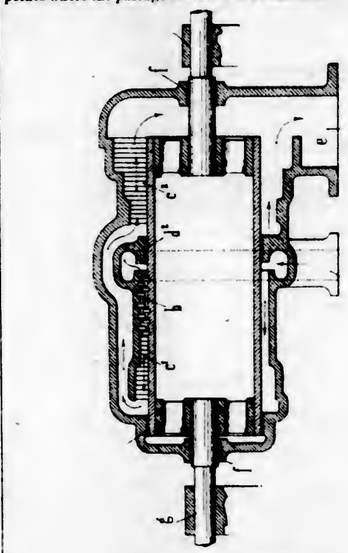
3. A nut-lock embodying an elongated washer-plate having a lateral curved portion thereon near one end, a tubulation on the opposite end of said washer-plate, a reinforcing washer-plate having a perforation between its ends and registering with a like perforation in the other washer-plate, a lateral curved portion on one end of said washer-plate and whereon the curved portion of the other plate bears, an angularly-shaped toe on the curved end of the reinforcing washer-plate, and a U-shaped locking-dog, one member of which is loosely held in the tubulation, the other spaced member thereof having a bent finger on its free end for turning said member toward or from a nut screwed upon a bolt passed through the opposite perforations in both of the washer-plates.

813,169. COMBINED IMPULSE AND REACTION TURBINE. CARL PFENNINGER, Munich, Germany, assignor to Mohns & Pfenninger Gesellschaft mit Beschränkter Haftung, Munich-Hirschau, Bavaria, Germany. Filed Dec. 7, 1905. Serial No. 290,792.

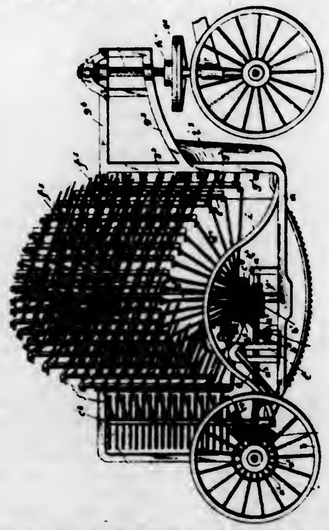
Claim.—1. In an impulse and reaction turbine, the combination of a drum of approximately equal diameter throughout its length, a stepped casing in which said drum rotates, a series of impulse-blades carried by said drum and casing, a series of reaction-blades also carried by said drum and casing and forming a continuation of the impulse-blades and a further series of reaction-blades oppositely arranged to the first series.

2. In an impulse and reaction turbine, the combination of a drum of approximately equal diameter throughout its length, a stepped casing in which said drum rotates, a series of impulse and reaction blades carried by said drum and casing, and a further series of reaction-blades at the opposite end of the drum and casing connected to the first series by a passage, whereby the steam is caused to first travel through the impulse-blades then through the first set of reaction-blades and thence backward through the passage to the second set of reaction-blades.

3. In an impulse and reaction turbine the combination of a drum of approximately equal diameter throughout its length, a casing comprising separate chambers, impulse and reaction blades carried by one chamber and impulse-blades only by the other chamber, the two sets of impulse-blades being connected by a passage capable of reversing the direction of travel of the fluid and packings formed of labyrinth flanges between the drum and casing at the points where the passage of fluid is to be checked.



813,170. COTTON-PICKER. JAMES K. PIPER, Wilmerding, Pa. Filed July 13, 1904. Serial No. 216,418.



Claim.—1. In a cotton-picker a frame, vertical shafts mounted in said frame, fulcrum-disks secured to said shafts near the upper and lower ends thereof, a series of arms fulcrumed in said disks, carriers mounted in the outer ends of said arms, a series of picker-fingers journaled in each of said carriers, means engaging said arms for moving the same vertically on their pivots during their endless travel, means for imparting motion to said vertical shafts to rotate the same and move the carriers in an endless course, a stationary means connected to the frame to engage said picker-fingers and revolve the same while passing through the cotton during the endless travel of the carrier, substantially as described.

2. In a cotton-picking machine, a frame, vertical shafts journaled in said frame, fulcrum-disks formed in two parts and secured to the said shafts, carrier-arms fulcrumed in said disks, carriers loosely connected to the outer ends of the arms, rotating picker-fingers journaled upon each of said carriers, means for moving the carrier-arms vertically upon their pivots to bring the picker-fingers into position to engage the cotton, gear-wheels mounted on each of said picker-fingers, combined with racks between which the picker-fingers pass and which engage the gear-wheels thereon to rotate the fingers while passing through the cotton, and means for driving said vertical shafts, substantially as described.

3. In a cotton-picker, a frame, vertical operating-shafts mounted therein, worm-gears on said shafts, disks secured to the said shafts, carrier-arms pivoted in the said disks, guides for controlling the said arms around their pivots, carriers pivoted between the outer ends of the arms, picker-fingers journaled in the carriers at an inclination thereto and each finger provided with a wheel at its inner end to cause it to revolve, combined with racks between which the fingers are caused to pass, and which engage the wheels on the fingers to rotate the same, horizontal driving-shafts provided at one end with worm-gears to mesh with the worm-gears on the vertical shafts, the outer ends of the said arms being provided with teeth and a lug both of which are adapted to engage with teeth on the end of the carriers, substantially as described.

4. In a cotton-picker, a frame, supported upon wheels, beveled gear-wheels on the axles, horizontal shafts having gears, vertical shafts journaled in the frame, bevel-gears and combs secured to the vertical shafts, the gear-wheels on the axle meshing with the gears on the rear ends of the horizontal shafts, vertical driving-shafts having gears, the gear on the front ends of the horizontal shafts meshing with those on the lower ends of the vertical driving-shafts, combined with fulcrum-disks mounted upon said vertical driving-shafts, carrier-arms loosely connected at their ends to said fulcrum-disks, carriers loosely connected to the outer ends of said carrier-arms, means for moving said carrier-arms in vertical planes, separate means for rocking the carriers on their vertical axis, a series of picker-fingers journaled in said carriers, and means for rotating said picker-fingers during a part of the endless travel of the carrier-arms and carriers, substantially as described.

5. In a cotton-picker, a frame mounted on wheels, vertical shafts mounted in said frame, fulcrum-disks secured to said shafts near the upper and lower ends thereof, said shafts provided at their lower ends with gears, horizontal shafts provided with bevel-gears at their rear ends and worm-gears at their front ends adapted to mesh with the gears on the lower ends of the vertical shafts, combined with arms fulcrumed at their inner ends in said disks, means for moving said arms vertically, carriers pivotally connected to the outer ends of said arms, means for controlling the movement of the carriers during their travel, picker-fingers journaled in said carriers and provided with wheels at their inner ends, curved guides between which the fingers are moved, and vertical comb-shafts operated by the gears on the rear ends of the horizontal shafts and provided with combs for removing the cotton from the fingers, substantially as described.

6. In a cotton-picker the frame mounted on wheels, a rotary comb-shaft mounted therein, a vertical operating-shaft, disks secured to said shaft, carrier-arms fulcrumed at their inner ends in said disks and provided at their outer ends with segmental-shaped toothed portions, means for moving said arms vertically, carriers pivoted between the ends of the arms and provided on their ends with teeth to engage the teeth on the arms, combined with picker-fingers journaled in the carriers and provided with operating-wheels at their inner ends, and curved racks between which the fingers are moved, to engage the wheels on the picker-fingers by which they are made to revolve, substantially as described.

7. In a cotton-picker, the frame mounted upon wheels, vertical shafts journaled in said frame and provided with gears near their lower ends, horizontal shafts supported by braces connected to the frame, and provided with gears to mesh with the gears upon the vertical drive-shafts, vertical shafts carrying combs and provided with bevel-gears which mesh with bevel-gears on the rear ends of the horizontal shafts, fulcrum-disks secured to the vertical drive-shafts at both their upper and lower ends, carrier-arms loosely attached to the disks, means for moving said arms vertically, carriers pivoted between the outer ends of the arms, means connected to the arms for rocking the carriers, a series of picker-fingers journaled upon each carrier, and provided with wheels near their inner ends and projecting picking-points which extend in a line along the fingers, and curved racks between which the fingers are moved to engage the wheels on the fingers by which they are caused to revolve while passing between the guides, substantially as described.

8. In a cotton-picker the frame mounted upon wheels, vertical operating-shafts journaled in said frame and provided with gears horizontal shafts journaled in the frame and provided with gears upon their forward ends to mesh with the gears upon the lower ends of the vertical shafts, fulcrum-disks secured to the vertical operating-shafts, carrier-arms loosely connected at their inner ends to the disks on the vertical shafts, means for moving said arms vertically, carriers pivotally secured between the ends of the arms, picker-fingers journaled in an inclined position in the carriers, and provided with wheels at their inner ends, guide-racks provided with teeth with which the wheels on the fingers engage as the fingers are moved between the guide-racks, the arms provided with teeth at their outer ends, and the carriers having teeth on their ends to engage the teeth on the arms, substantially as described.

9. In a cotton-picker, a frame mounted upon wheels and provided with side and upright rails, a screw-threaded vertical shaft threaded in the front of the frame, a bevel-gear on the upper end of the shaft, a brace secured to the frame, a bevel-gear and crank-shaft supported in said brace, a bearing-block supported horizontally above the front axle to receive the lower end of said screw-threaded vertical shaft, a pair of vertical driving-shafts journaled in said frame, fulcrum-disks secured to the said shafts, a series of arms fulcrumed in said disks, carriers between the pivoted outer ends of said arms, a series of picker-fingers journaled in each of said carriers, means for moving said arms vertically on their pivots, means for operating said vertical drive-shafts, and means connected to the frame with which said picker-fingers are brought into engagement to rotate the same during the time they are in engagement with said means, substantially as described.

10. In a cotton-picker, the frame mounted upon wheels, vertical shafts journaled in said frame, combs mounted on said vertical shafts, vertical drive-shafts provided with gears at their lower ends, fulcrum-disks secured to said vertical shafts at their upper and lower ends, combined with arms loosely connected to said fulcrum-disks at their inner ends and provided with teeth and lugs at their outer ends, means for moving said arms vertically, carriers pivoted between the outer ends of the arms and provided on their ends with teeth and lugs which engage the teeth and lugs on the arms, a series of picker-fingers journaled in each carrier in an inclined position and provided with operating-wheels at their inner ends, the lugs on the arms being adapted to engage the lugs on the carriers when the teeth of the carriers and arms have passed from engagement to operate the carriers and throw the free ends of the fingers toward the vertical drive-shafts, and curved guides between which the fingers are moved for engagement of the wheels carried by the fingers with said guides to rotate the fingers, substantially as described.

11. In a cotton-picker, a frame, vertical shafts journaled in said frame, fulcrum-disks secured to the shafts at their upper and lower ends, carrier-arms loosely connected at their inner ends to said disks, and means for moving said arms vertically, combined with carriers pivoted between the outer ends of the arms, a series of picker-fingers journaled in each of said carriers and having projecting picking-points extending toward the free ends of the fingers, and means for causing the shafts to revolve and carry the carriers and picker-fingers around therewith, substantially as described.

12. In a cotton-picker, a series of carriers, a series of picker-fingers journaled in each of said carriers at an incline thereto and having projecting picking-points arranged in alinement thereon, supporting-arms for the carriers, vertical operating-shafts, fulcrum-disks secured to said vertical shafts and in which said supporting-arms are loosely mounted, means for operating said supporting-arms vertically, said vertical shafts being provided with gears at their lower ends, combined with horizontal shafts provided with worm-gears adapted to mesh with the gears on the vertical shafts, and revolving combs arranged on the rear end of the machine and operated by said horizontal shafts, substantially as described.

13. In a cotton-picker, a series of carriers, a series of arms between which the carriers are mounted, vertical shafts to which the arms are pivotally connected by horizontal pivots, and means for operating said arms vertically, combined with picker-fingers journaled in an inclined position in each of the carriers, and provided with projecting picking-points which are arranged in alinement thereon, means for turning the carriers on their axes, and means engaging the picking-fingers for causing the same to revolve while in engagement with the cotton, substantially as described.

14. In a cotton-picker, the frame supported upon driving-wheels, the beveled gearing on the axle of said wheels, horizontal

shafts journaled in the frame, and provided with gears at their ends to engage the gears on the axle, and with worm-gears at their front

dition and in the required quantity to compact the said binding material.

818,172. LAMP-BURNER. WILLIAM G. RANKIN, Coal Valley, Pa. Filed Nov. 10, 1905. Serial No. 286,733.

tractor, said center head having a slot therein, and a clamping-bolt passing through said last slot and said first slot.

shafts journaled in the frame, and provided with gears at their ends to engage the gears on the axle, and with worm-gears at their front ends, vertical shafts journaled in the frame, and provided with gears at their lower ends to engage the worm-gears on the front ends of the horizontal shafts, combined with fulcrum-disks secured to the vertical shafts and provided with radial slots, arms fulcrumed at their inner ends to said disks, carriers pivotally supported between the outer ends of said arms, means carried by said arms for rocking the carriers, a series of picker-fingers journaled in each carrier, means for revolving the fingers in unison with the rotation of the vertical shafts and carriers, a flaring U-shaped casing for guiding the cotton to the fingers, and means for elevating the carriers and arms, substantially as described.

15. In a cotton-picker, a frame, vertical shafts journaled in said frame, fulcrum-disks secured near the upper and lower ends of said vertical shafts and gears secured to their lower ends, horizontal shafts provided with gears on their front ends to engage the gears on the vertical shafts, and means for operating said horizontal shafts, combined with carrier-arms, secured to the vertical shafts, means for operating said carrier-arms vertically, a series of carriers loosely connected to said carrier-arms, a series of picker-fingers journaled in each of said carriers, each of said fingers having a wheel mounted thereon and provided with projecting points and curved racks between which the fingers are passed and which engage the wheels on the fingers to rotate the latter, substantially as described.

16. In a cotton-picker, a frame mounted upon wheels, vertical shafts journaled in said frame and means for communicating motion to said shafts from the rear axle, combined with fulcrum-disks secured to said vertical shafts, a series of arms fulcrumed at their inner ends in said disks, carriers pivotally mounted between the outer ends of said arms, means for operating said arms vertically and means carried by the arms for rocking the carriers, a series of picker-fingers journaled in each of said carriers and each of said fingers being provided with a wheel, and curved racks between which the fingers are passed and which engage said wheels for causing the picker-fingers to rotate, substantially as described.

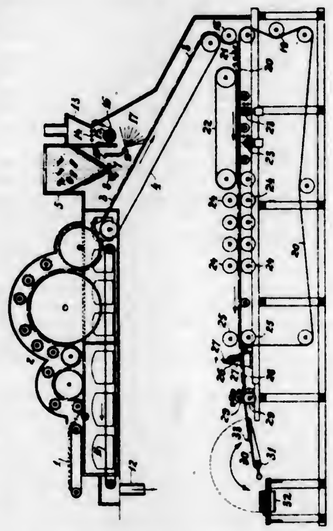
17. In a cotton-picker, the combination of a frame mounted upon wheels, vertical shafts mounted in said frame, means for rotating said vertical shafts, fulcrum-disks secured to the vertical shafts near the upper and lower ends thereof, carrier-arms pivotally connected to said disks by horizontal pivots, carriers pivoted between the outer ends of said arms, means for operating said carrier-arms vertically, and means carried by the arms for rocking said carriers, a series of picker-fingers journaled in an inclined position in each carrier and each finger provided with projecting curved picker-points arranged in alinement and adapted to engage the cotton-bolls, means for causing said fingers to revolve while passing through the cotton, a screw-threaded vertically-arranged shaft mounted upon the front end of the frame for adjusting the height of the fingers, and a flaring U-shaped casing secured to the front end of the frame for guiding the cotton to the picker-fingers, substantially as described.

18. In a cotton-picking machine, a frame mounted on wheels, vertical shafts journaled in said frame, means for communicating a rotary motion to the shafts from the rear axle, disks secured to the shafts at their upper and lower ends, arms fulcrumed at their inner ends to the disks and provided at their outer ends with teeth and lugs, combined with carriers pivoted between the outer ends of the arms and provided with teeth upon both ends to engage with the teeth upon the arms, a series of picker-fingers journaled in each carrier at an angle thereto and provided at their inner ends with wheels, racks adapted to engage said wheels to revolve the picker-fingers, inclined sides secured to the frame and adapted to receive the arms to lift the same when the fingers are out of engagement with the cotton, combs mounted in the frame to remove the cotton from the picker-fingers, and means for causing said combs to revolve, substantially as described.

813,171. PROCESS FOR THE PRODUCTION OF ARTIFICIAL-STONE PLATES. CARL POSL, Budapest, Austria-Hungary. Filed May 2, 1905. Serial No. 258,858.

Claim.—1. Process of producing artificial-stone plates, consisting in spreading upon a layer of filamentous material binding material, as hydraulic cement in a dry state and subsequently adding water in a finely-divided condition and in the required quantity to compact the said binding material.

2. A process of producing artificial-stone plates, consisting in uniformly distributing upon a layer of dry filamentous material a binding material, as hydraulic cement mixed with sand, in a dry powdered state, and subsequently adding water in a finely-divided condition and in the required quantity to compact the said binding material and carrying the not yet hardened mass at a certain speed onto a carrier moving at a less speed, the folds caused thereby in the mass being joined and compacted by pressing and shaking the mass.



3. Process of producing artificial-stone plates, consisting in uniformly distributing over a layer of dry filamentous material a binding material in a dry powdered state, subsequently adding water in a finely-divided condition and in the required quantity to compact the said binding material and carrying the not yet hardened mass at a certain speed onto a carrier moving at a less speed, the folds caused thereby in the mass being joined and compacted by pressing and shaking the mass.

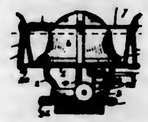
4. A process of producing artificial-stone plates, which consists in spreading hydraulic cement, mixed with sand, in a dry powdered condition upon a layer of dry filamentous material as asbestos, subsequently adding water in small quantities so as to compact the binding material and carrying the not yet hardened wet mass at a certain speed onto a carrier moving at a less speed, the folds produced thereby being compacted by shaking the carrier and passed between the carrier and an endless band, whereby the mass is made of uniform thickness.

5. A process of producing artificial-stone plates, consisting in uniformly distributing a binding material, as hydraulic cement in a dry powdered condition over a layer of dry filamentous material, subsequently adding small quantities of water to compact the said binding material and carrying the whole not yet hardened mass at a certain speed onto a carrier, moving at a less speed, folds in the mass being caused thereby, which folds are compacted by oscillating beaters shaking said carrier and an endless band pressing the mass between itself and said carrier.

6. A process of producing artificial-stone plates, consisting in spreading a binding material, as hydraulic cement, in a finely-divided dry condition upon a loose layer of dry filamentous material, subsequently adding water in a finely-divided condition to compact the said binding material and carrying the not yet dried mass at a certain speed to a carrier, moving at a less speed, folds being produced thereby in the mass, which, by shaking the carrier and by applying pressure, are caused to form into a compact layer of uniform thickness, means being provided for varying the speed of the carrier, whereby the thickness of the compacted layer can be varied.

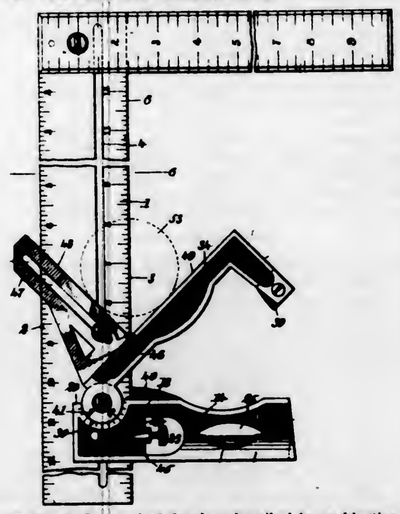
7. A process of producing artificial-stone plates, of any desired thickness and size, consisting in spreading a binding material in a finely-divided dry condition upon a layer of dry filamentous material, subsequently adding a sufficient quantity of water to compact the said binding material and carrying the not yet hardened dried mass at a certain speed to a carrier, moving at a less speed, folds being caused thereby in the mass, which folds are compacted by shaking the said carrier and by pressure, thus forming a compact layer of uniform thickness, the mass thus compacted being cut and divided into plates of the required size, while not yet hardened.

813,172. LAMP-BURNER. WILLIAM G. RANKIN, Coal Valley, Pa. Filed Nov. 10, 1905. Serial No. 286,733.



Claim.—In a lamp-burner, the combination with a collar adapted to be screwed into the oil-receptacle, of a second collar hinged to the first-named collar and provided with upwardly-extending arms, a perforated plate carried by said arms, a ring hinged to said perforated plate and spring-arms carried by said ring and adapted to embrace a lamp-chimney.

813,173. MECHANIC'S SQUARE. JOSEPH M. REALING, Daytona, Fla. Filed Oct. 28, 1905. Serial No. 284,795.



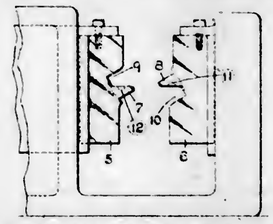
Claim.—1. In a tool of the class described in combination, a main blade having a longitudinal slot therein, a stock adapted to slide on said blade, a protractor, and a bolt pivotally attaching said protractor to said stock and passing through said slot, said bolt affording means for clamping said protractor and said stock to said blade.

2. In a tool of the class described in combination, a main blade having a longitudinal slot therein, a stock slidably mounted on said main blade, a protractor pivotally mounted on said stock, a center head attached to said protractor and having a longitudinal slot therein, and a clamping-bolt passing through said slots and affording means for adjusting said protractor and said center head in unison.

3. In a tool of the class described, a main blade, a stock slidably mounted thereupon, a protractor-bar pivotally mounted on said stock and adapted to lie upon the upper edge thereof, said stock having a tubular chamber formed therein, a spirit-vial received in said tubular chamber, a plug closing the outlet from said chamber at the extremity of said stock remote from said blade, said plug having a groove in the outer face thereof, and a feather carried by said protracter-bar and adapted to engage said groove.

4. In a tool of the class described in combination, a main blade, a pitch-blade removably attached to said main blade at one extremity thereof, said main blade having a longitudinal slot therein, a stock slidably mounted on said main blade, a clamp carried by said stock and engaging said slot for rigidly securing said stock, a protractor, a bolt securing said protractor to said stock and passing through said slot, said protractor consisting of plates lying respectively on opposite sides of said main blade and having openings therein adjacent to the inner extremity of said protractor, a center head having dowel-pins adapted to engage said openings and presenting an edge disposed substantially at right angles to the edge of said protractor, said center head having a slot therein, and a clamping-bolt passing through said last slot and said first slot.

813,174. FORGING AND WELDING MACHINE. CHARLES REINHART, St. Louis, Mo., assignor to The American Brake Company, St. Louis, Mo., a Corporation of Missouri. Filed Apr. 1, 1905. Serial No. 253,294.



Claim.—1. The combination with oppositely-located half-dies, of mandrel projections carried by the said half-dies and out of alinement with each other, said dies when closed having recesses adjacent the mandrel projections whereby openings are left on opposite sides of the mandrel; substantially as described.

2. The combination with oppositely-located half-dies, of a diagonally-split mandrel having two parts, one of which is carried by each half-die and each of which is out of alinement with the other, said die when closed having recesses at the bases of the mandrel parts whereby openings are left on the opposite sides of the mandrel; substantially as described.

813,175. AUTOMOBILE-FRAME. ALBERT R. SCHAAF and FRANK S. DAVIS, Toledo, Ohio. Filed Aug. 27, 1904. Serial No. 223,300.

Claim.—A member for automobile-frames comprising a metallic bar bent to present an exterior bearing-surface as 4 and substantially parallel supporting members as 3, said supporting members being approximately perpendicular to the said bearing-surface and longitudinal strengthening-beads, as 6, formed upon the outer margins of the said supporting members, said strengthening-beads being formed by folding back upon themselves the margins of the supporting members 3 substantially as described.

813,176. SELF-ADJUSTING BELT FOR SUPPORTING CATAMENIAL BANDAGES. EUGENIA SCHICK, Fly Mountain, N. Y. Filed Aug. 22, 1904. Serial No. 221,063.

Claim.—1. A belt for supporting catamenial bandages, comprising side sections, each gradually increasing in width from the center to its ends, one section being formed of two members detachably secured together, substantially lozenge-shaped hanger-bands having their upper portions arranged between and spaced from the ends of the sections, one at the front and the other at the rear, and a plurality of elastic bands connecting each hanger-band with the ends of the sections, the lower free portions of said hanger-bands being of greater length than the portions between the sections and forming depending tabs for supporting a bandage.

2. A belt for supporting a catamenial bandage, comprising side sections, one section being formed of two parts detachably secured

3. In an attachment for war vessels, the combination of vertical racks, pinions to raise and lower said vertical racks, guides secured

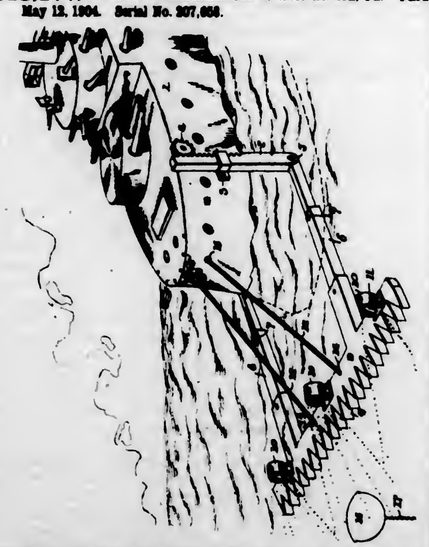
hand-lever pivoted to said opposing intermediate side of the hollow

813,182. COMBINED ANCHOR-HOOK, GUY-CLAMP, AND GUY-STRETCHER. GEORGE F. SWEETSER, Newark, N. J. Filed

2. A belt for supporting a catamenial bandage, comprising side sections, one section being formed of two parts detachably secured together, substantially lozenge-shaped hanger-bands having their upper portions arranged between and spaced from the ends of the side sections, and a plurality of elastic bands connecting each hanger-band with the ends of the side sections, the lower portions of the hanger-bands forming depending tabs, and provided at their lower ends with elastic loops.

3. A sanitary belt comprising two side sections scalloped on their side edges and each formed of two plies of fibrous fabric stitched together at their edges, two substantially lozenge-shaped hanger-bands having their upper ends arranged between and spaced from the ends of the sections, one at the front and the other at the rear, and a plurality of elastic tapes connecting each hanger-band with the ends of the sections, said tapes being secured between the plies of the belt-sections and the upper portions of the side edges of the hanger-bands by stitching, thus producing a washable belt adapted to fit upon the person and provide suspensory tabs thereon.

813,177. **VESSEL.** SACCHEUS SCOTT, West Newton, Pa. Filed May 13, 1904. Serial No. 207,668.



Claim.—1. The combination with a vessel, of vertically-movable rack-bars mounted on the side of the vessel adjacent the bow, gear-wheels meshing with said rack-bars, means for revolving said gear-wheels to raise and lower the rack-bars, sectional telescoping arms pivotally attached to said rack-bars, a cutter-bar rigidly connecting the outer ends of said telescoping arms, cables attached to said cutter-bar, and extending rearwardly and upwardly therefrom to the vessel, and means for exerting tension on said cables to raise said cutter-bar, and means for locking the telescoping bars in extended position.

2. In an apparatus of the character described, the combination of a vessel, vertically-movable rack-bars mounted on the vessel adjacent the bow thereof, means for raising and lowering said bars, horizontal arms pivotally secured to said vertically-movable bars, a cutter-bar carried by said horizontal arms and extending laterally beyond the said horizontal arms on each side, cables attached to said cutter-bars and extending to the vessel, and means for exerting tension on the cables to raise the cutter-bar.

3. In an attachment for war vessels, the combination of vertical racks, pinions to raise and lower said vertical racks, guides secured to the vessel embracing said racks, extensible horizontal arms pivotally secured to the lower end of said racks, a cutter-bar secured to the ends of said arms, and means attached to said cutter-bar whereby the same may be raised or lowered, substantially as described.

813,178. **SLIP-JOINT CONNECTION FOR DENTAL HAND-PIECES.** EDWARD H. SMITH and HARRY F. JOHNS, Philadelphia, Pa. Filed June 3, 1905. Serial No. 263,373.

Claim.—1. In a device of the character described, an outer casing having an aperture therethrough, an inner casing, a spring member integral therewith and having a free end and an outwardly-extending lug on said free end, the rear and side walls of which are adapted to closely engage the corresponding walls of said aperture, whereby the inner and outer casings are securely locked together and relative movement of the same is prevented.

2. In a device of the character described, an outer casing having an aperture therethrough, an inner casing, a spring member integral therewith and having a free end and an outwardly-extending lug on said free end adapted to enter said aperture and when so situated being substantially flush with the surface of the outer casing, the front wall of said lug being beveled and the rear and side walls of said lug being adapted to engage the corresponding walls of said aperture, whereby the inner and outer casings are securely locked together and relative movement of the same is prevented.

813,179. **MOP-WRINGER.** FRANK B. SMITH, Palmyra, N. Y. Filed Feb. 4, 1905. Serial No. 244,190.

Claim.—1. A mop-wringer consisting of a rectangular hollow body having three consecutive sides formed of a single integral metallic piece and open at the remaining side and at the ends, a section within said hollow body and pivoted to opposite sides thereof and above the lower end of the body, said body having projecting points folded at the lower inner edges thereof and means for swinging said pivoted section within the hollow body.

2. A mop-wringer consisting of a rectangular perforated hollow body having three sides formed of a single piece and open at the remaining side and at the upper and the lower ends, a perforated section forming a fourth side of the hollow body pivoted to said body and adapted to swing therein, a pair of draft-links joined to said pivoted fourth side and extending through openings in the back wall of the hollow body, and an operating-lever pivoted on lips projecting outward from said body and joined directly to said draft-links, to swing said pivoted side.

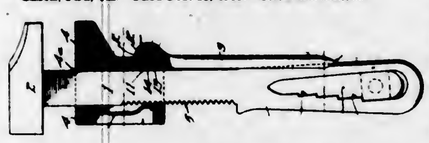
3. A mop-wringer consisting of a rectangular perforated hollow body having three sides formed of a single piece of metal and open at one side and at the upper and the lower ends, a perforated section forming a fourth side for the hollow body, said body provided with integral lips projecting therefrom, said section being pivoted to swing into said body, a pair of draft-links joined to said pivoted fourth side and extending through openings in the rear wall of the hollow body, and an operating-lever pivotally held in said lips on said body and joined to said draft-links to swing the pivoted side, the operating-lever being offset above the draft-links.

4. A mop-wringer consisting of a rectangular perforated hollow body having three sides formed of a single piece and open at one side and at the upper and the lower ends, a perforated part forming a fourth side for the hollow body pivoted to said hollow body and adapted to swing therein, a pair of draft-links occupying openings in said fourth side and in the opposing side of the hollow body and having their ends offset and joined by a pivot-bolt outside of said body, and a hand-lever pivoted to said opposing intermediate side of the hollow body and upon said pivot joining the draft-links, for swinging said pivoted fourth side, the two opposite sides of said body having integral points folded inward toward the third side to contact with the inner surface of a containing vessel.

5. In a mop-wringer a perforated blank sheet of metal having similar notched and angular ends and bent along two parallel lines to form three consecutive sides of a rectangular hollow body or inclosure and having projecting points folded, a fourth movable side of the hollow body held upon pivot-bearings of said body, a lever carried by said hollow body, and connectors for said lever and said movable side.

6. In a mop-wringer a perforated blank sheet of metal having similar notched and angular ends each formed with a projecting point, the sheet being bent to form three consecutive sides of a rectangular hollow body with said projecting points folded, a rectangular blank sheet of metal with projecting sides and ends the latter being folded upon the body of the sheet, and the projecting sides bent at right angles with the body of the sheet to form stiffening-flanges therefor, said sheet thus formed constituting a fourth movable side of said hollow body, and means for holding said fourth side and for moving it within the hollow body.

813,180. **QUICK-ACTING MONKEY-WRENCH.** JAMES L. SMITH, Piru, Cal. Filed Feb. 13, 1905. Serial No. 245,369.



Claim.—A monkey-wrench comprising a toothed shank carrying a fixed jaw, a movable jaw member slidable on the shank and having lateral play thereon and provided with teeth for engaging the shank-teeth, a spring pressing the shank-teeth away from the teeth on the movable jaw member, a cam pivoted on the movable jaw engaging the shank to draw the teeth together, and means for adjusting the projection of said cam, consisting of a screw in the cam engaging the pivot thereof, the cam having a slot engaging its pivot to permit of such adjustment.

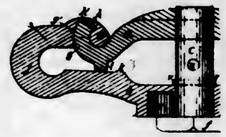
813,181. **FRANGIBLE CAP FOR THE CLOSURE OF BOTTLES.** SAMUEL M. STEVENS, Tampa, Fla. Filed Apr. 5, 1905. Serial No. 254,010.

Claim.—1. A frangible cap for bottle-necks, comprising a dome-shaped portion, integral limbs depending therefrom and primarily bent outward affording openings between the limbs, the limbs after heating being adapted by compression for a clasping engagement with the neck of the bottle when the cap is mounted thereon.

2. A frangible cap for a bottle-neck, comprising a dome-shaped top portion having spaced openings therein, integral limbs depending from the top portion between said openings and primarily bent outward, said limbs being adapted, after heating, by compression to clasp a bottle-neck when the cap is mounted thereon.

3. The combination with the neck of a bottle having a bead around its edge, and a cork therein, of a cap comprising a dome-shaped top portion having a plurality of spaced openings therein, a plurality of limbs depending from the top portion between said openings, the limbs diverging, but adapted by compression for closure below the bead, and thus secure the cap on the bottle-neck.

813,182. **COMBINED ANCHOR-HOOK, GUY-CLAMP, AND GUY-STRETCHER.** GEORGE F. SWORTWOOD, Hewark, N. J. Filed Aug. 1, 1905. Serial No. 272,211.



Claim.—1. The combination in a single device of means for attachment to an eyebolt, means for clamping the guy-wire, and means between the two and united therewith for winding in the end of the guy and securing it against unwinding when wound, comprising a drum to which the guy is attached, a head on the drum for the application of a wrench, a chamber in one of the plates contiguous to one of the bearings of the drum, and a roller in the chamber having contact on one side with a bearing of the drum and on its other side with an inclined part of the chamber.

2. A combination guy hook, stretcher and clamp comprising two plates adapted to interlock at one end and constituting a hook, the other ends forming a clamp secured together by bolts, the intermediate portions forming an open loop with a winding-drum therein for holding and winding in the guy through the clamps.

3. A combination guy hook, stretcher and clamp comprising two plates, one end of the plates forming a clamp to be united by bolts, the other ends of the plates interlocking and embodying a hook, the intermediate parts of the plates forming a loop with a winding-drum therein for holding and winding in the guy through the clamps, and locking means to prevent a reverse movement of the drum.

4. A combination guy lock, stretcher and clamp comprising two plates forming a clamp at one end, a loop for a guy-winding drum in the middle, and interlocking hooks for joining the plates and an anchor-hook at the other end, a guy-winding drum through the two plates, a chamber for a friction-roller on one side of one of the drum-bearings, a friction-roller in said chamber, the head on the drum serving as a surface closure of the chamber.

5. A combination guy hook, stretcher and clamp comprising two plates, the two plates forming a clamp at one end to be secured by bolts, a loop for and a guy-winding drum in the middle, with means for interlocking the plates at the other end comprising a hook on one of the plates extended into a hook with a transversely-rounded end to fit a curve in the second plate, a rounded notch back of said end to receive the correspondingly-rounded end of the second plate, and a recess at the base of said rounded notch to receive the curved projection on the end of the second plate, and a bearing-point on the second plate to retain these interlocking parts together when the clamp ends of the plates are brought together.

6. In a combined guy hook, stretcher and clamp the combination with the anchor-hook and guy-clamp of a winding-drum having bearings in the combined plates, a head or heads on the drum adapted for the use of a wrench, a hole through the drum in which to secure the guy, a chamber contiguous to one of the bearings of the drum to contain a friction-roller, and a friction-roller in said chamber adapted to engage with the bearing of the drum.

7. In a combined guy hook, stretcher and clamp the combination with the anchor-hook and guy-clamp of a winding-drum having bearings in the combined plates, a head or heads on the drum adapted for the use of a wrench, a hole through the drum in which to secure the guy, a chamber contiguous to one of the bearings of the drum to contain a friction-roller, a friction-roller in said chamber and the head of the drum adapted to cover the chamber.

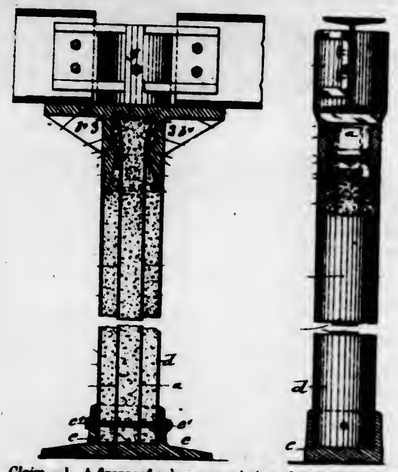
8. In a combined guy hook, stretcher and clamp, as shown, the combination with the guy-winding drum of a chamber contiguous to one of the bearings of the drum to contain a friction-roller, a roller in said chamber adapted to engage with and clamp the drum-bearing, and a channel to the said chamber to give access to the roller.

9. In a combined guy hook, stretcher and clamp having multiple guy-winding drums, one of the drums provided with multiple holes for the ends of guy-strands, and multiple grooves in the clamp for securing a loop in the manner shown.

10. In a combined anchor-hook guy stretcher and clamp as shown, the combination with the guy-winding drum of one of the bearings in the plates for the drum expanded into a chamber and a roller in said chamber to engage with the drum on one of its sides and with an inclined surface on its other side.

813,183. **FIREPROOF COLUMN AND COLUMN-CAP.** JOHN J.

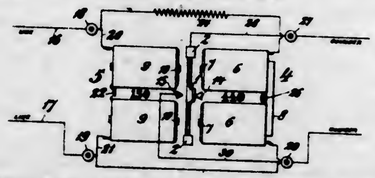
813,183. FIREPROOF COLUMN AND COLUMN-CAP. JOHN J. TRAUTMANN, New York, N. Y., assignor to American Column Company, Brooklyn, N. Y., a Corporation of New York. Filed Oct. 23, 1905. Serial No. 283,914.



Claim.—1. A fireproof column, consisting of an interior core or pillar provided with a flattened upper end, a column-cap provided with a socket having an interior contracted portion corresponding in shape to the flattened end, an exterior shell or jacket placed over the lower part of the socket of the column-cap, means for connecting the socket, core and jacket, and a fireproof filling for the interior of the core, socket and exterior jacket or shell.

2. A fireproof column, consisting of an interior core or pillar provided with a flattened upper end, a cap provided with a socket tapering toward its lower end and provided with an interior contracted portion corresponding with the shape of the flattened end, an exterior jacket or shell placed on the socket of the column-cap, the interior core and socket being provided with alined openings, and a fireproof filling in the interior core and between the socket and exterior jacket or shell, said filling entering said openings and forming an anchor between the core and socket.

813,184. RELAY. ANGEL VERA and LUIS G. VERA, Cuerotaro, Mexico. Filed Nov. 28, 1904. Serial No. 234,333.



Claim.—1. The combination with an armature, of opposed electromagnets therefor, the one arranged to operate more rapidly than the other, the more rapid of said magnets actuating the armature upon closing of circuit therethrough, and the other of said magnets actuating the armature upon opening of the circuit therethrough.

2. The combination with an armature, of opposed electromagnets therefor, connected with the same source of current, the one arranged to operate more rapidly than the other, the more rapid of said magnets actuating the armature upon closing of circuit therethrough, and the other of said magnets actuating the armature upon opening of the circuit therethrough.

3. The combination with an armature, of opposed electromagnets therefor, the one having magnetically-connected cores, and the other having an unconnected core with free ends.

4. The combination with an armature, of opposed electromagnets therefor, the one having a horseshoe-core, and the other having a straight-line core.

5. The combination with an armature, of opposed electromagnets therefor, each having two coils and cores around which the said coils are wound, the cores of one electromagnet magnetically connected together, and the cores of the other electromagnet free and unconnected.

6. The combination with an armature, of opposed electromagnets therefor, arranged in multiple with each other, each having two coils arranged in series, and cores around which the said coils are wound, the cores of one electromagnet magnetically connected together, and the cores of the other electromagnet free and unconnected.

7. The combination with an armature, of opposed electromagnets therefor, the one arranged to operate more rapidly than the other, said armature arranged to rest normally in the direction of the less-rapidly-operated magnet.

8. The combination with an armature of opposed electromagnets therefor, the one arranged to operate more rapidly than the other, said armature arranged to fall by gravity in the direction of the less-rapidly-operated magnet.

9. The combination with an armature, of opposed electromagnets therefor, connected with the same source of current, the one offering a greater resistance than the other, one of said magnets actuating the armature upon closing of circuit therethrough, and the other of said magnets actuating the armature upon opening of the circuit therethrough.

10. The combination with an armature, of opposed electromagnets therefor, connected with the same source of current, and a resistance arranged between the two said magnets, one of said magnets actuating the armature upon closing of circuit therethrough, and the other of said magnets actuating the armature upon opening of the circuit therethrough.

11. The combination with an armature, of opposed electromagnets therefor, the one arranged to operate more rapidly than the other, said electromagnets connected with the same source of current, and offering the one a greater resistance than the other, one of said magnets actuating the armature upon closing of circuit therethrough, and the other of said magnets actuating the armature upon opening of the circuit therethrough.

12. The combination with an armature, of means for producing opposed magnetic fields therefor, said means simultaneously controlled, but operating the one more rapidly than the other, the more rapid of said magnetic fields actuating the armature in one direction, at substantially the moment of production thereof, and the other of said magnetic fields actuating the armature in the other direction, at substantially the moment of reduction thereof.

13. The combination with an armature, of opposed electromagnets therefor, simultaneously operated, but arranged the one for more rapid magnetization and demagnetization than the other one of said electromagnets actuating the armature in one direction upon magnetization, and the other of said electromagnets actuating the armature in the other direction, at substantially the moment of deenergization.

14. A neutral electromagnetic instrument comprising an armature, and two simultaneously-controlled electromagnets in the same circuit, one of said electromagnets attracting the armature in one direction upon closing of circuit through both the magnets, and the other of said electromagnets attracting the armature in the other direction upon opening of circuit through both the magnets.

15. The combination with an armature, of opposed electromagnets therefor connected in multiple circuit with respect to each other, and one arranged to magnetize and demagnetize more rapidly than the other.

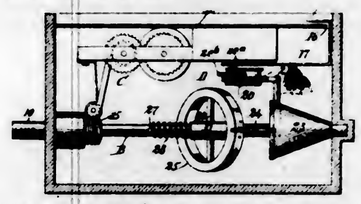
16. The combination with an armature, of opposed electromagnets therefor connected in multiple circuit with respect to each other, and one arranged to magnetize and demagnetize more rapidly than the other, and resistance in series circuit with the less rapid of said magnets.

813,185. SPEED-INDICATOR. BERNHARD VOLKHAR, New York, N. Y., assignor, by direct and mesne assignments, to The Acme Automotor Company, New York, N. Y. Filed July 21, 1905. Serial No. 270,611.

Claim.—1. In a speed-indicator, a revolving shaft, a cone, a governor-ring having connection with a fixed point on the shaft and mounted to slide on the shaft, the said ring also having connection with said cone, and means for resisting the centrifugal force of the said ring.

2. In a speed-indicator, a drive-shaft, a governor-ring having connection with the fixed point on the shaft and mounted to slide on the shaft, and means for resisting the centrifugal force of the ring.

3. In a speed-indicator, a drive-shaft, a governor-ring mounted to turn with and have sliding movement upon the said shaft, a long tapered cone, a link connection between the cone and the governor-ring, and an opposing link connection between the governor-ring and a projection from the shaft.

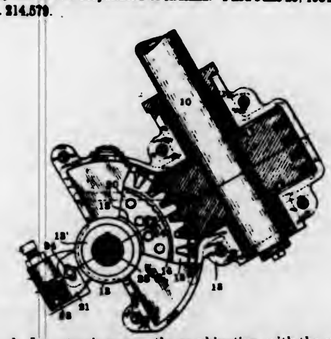


4. In a speed-indicator, a revolving shaft, a governor-ring mounted to slide on the shaft and turn therewith, a cone having link connection with the ring, a tension-stop for the ring, a train of gearing, a hand operated thereby, a segment which operates the train of gearing, and an arm from the segment which engages with the periphery of the cone.

5. In a speed-indicator, a shaft, a governor, a long tapered cone sliding upon the said shaft and connected with the governor, a train of gearing adapted to operate a hand or pointer, a segment in operative connection with the gearing, and an arm from the said segment which engages the peripheral surface of the cone.

6. In a speed-indicator, the combination with the casing, the shaft mounted to turn therein, having a longitudinal central slot, and a post extending through the shaft at one end of the slot, of a cone mounted to slide on the shaft at the opposite end of the said slot, a governor-ring through which the said shaft passes, a link connection between the ring and the cone, an opposing link connection between the said ring and the said post, a sleeve mounted to slide on the shaft within the ring, a pin extending from side to side of the governor-ring between the links, which pin passes through the said sleeve and the slot in the said shaft, having sliding movement in the said slot, a spring coiled around the said shaft, bearing against the said sleeve and the said post, a train of gearing, a hand or pointer operated thereby, a segment in operative engagement with the said train of gearing, and a roller-arm extending from the segment to an engagement with the peripheral portion of the cone.

813,186. STEERING-GEAR FOR AUTOMOBILES. JESSE WARRINGTON, Indianapolis, Ind., assignor to Nordyke & Marmon Company, Indianapolis, Ind., a Corporation of Indiana. Filed June 29, 1904. Serial No. 214,579.



Claim.—1. In a steering-gear, the combination, with the steering-shaft and worm carried thereby, of a worm-segment meshing with said worm and consisting of a pair of mating toothed segments angularly adjustable relatively to each other, an inclosing casing for said parts, and adjustable means accessible from the exterior of said casing for yieldingly holding said mating segments in various positions of relative angular adjustment.

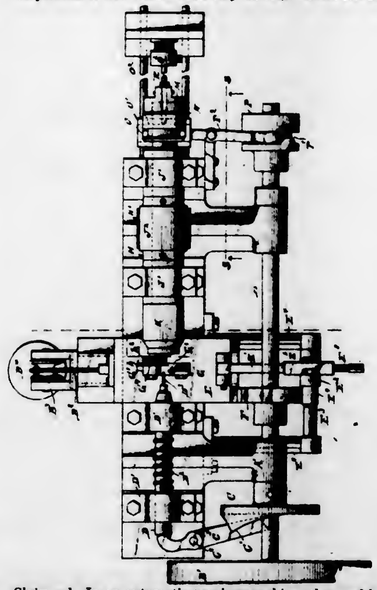
2. In a steering-gear, the combination, with the steering-shaft and worm carried thereby, of a second shaft, a worm-segment carried by said second shaft and meshing with said worm, said segment consisting of a pair of mating toothed members, one attached to said shaft and the other angularly adjustable about the shaft, each of said members provided with a portion projecting from the shaft opposite from the toothed portions thereof, a yielding buffer carried by one of said projections, and a coöperating part carried by the other of said projections.

3. In a steering-gear, the combination, with the steering-shaft and worm carried thereby, of a second shaft, a worm-segment carried by said second shaft and meshing with said worm, said segment consisting of a pair of mating toothed members, one attached to said shaft and the other angularly adjustable about the shaft, each of said members provided with a portion projecting from the shaft opposite from the toothed portions thereof, a yielding buffer carried by one of said projections, a coöperating part carried by the other of said projections, and an inclosing casing inclosing the worm and the segments.

4. In a steering-gear, the combination, with the steering-shaft and the worm carried thereby, of a second shaft, a toothed worm-segment attached to said second shaft and provided with an arm projecting away from the toothed portion, a second mating toothed section journaled upon the first toothed section, and also provided with an arm projecting away from the toothed portion and lying adjacent the similar arm of the first segment, an adjustable abutment carried by one of said arms, and a yielding buffer carried by the other of said arms, all substantially as and for the purpose set forth.

5. In a steering-gear, the combination, with the steering-shaft and the worm carried thereby, of a second shaft, a toothed worm-segment attached to said second shaft and provided with an arm projecting away from the toothed portion, a second mating toothed section journaled upon the first toothed section, and also provided with an arm projecting away from the toothed portion and lying adjacent the similar arm of the first segment, an adjustable abutment carried by one of said arms, a yielding buffer carried by the other of said arms, and an inclosing casing inclosing the worm and toothed portions of the worm-segment, all substantially as and for the purpose set forth.

813,187. AUTOMATIC TURNING, SHAPING, AND FINISHING MACHINE. ALBERT R. WEISS, New York, N. Y., assignor to The Matchless Cigar Lighter Manufacturing Company, New York, N. Y., a Corporation of New York. Filed July 13, 1905. Serial No. 269,472.



Claim.—1. In an automatic turning-machine, the combination with a rotative chuck and means for automatically opening and closing the same, of a non-rotative drill in line with said chuck, a carriage mounted to move transversely to the axis of the chuck and drill, a stop fixed on said carriage and having a recess in line with the axis of the drill, a combined parting and shaping tool on said carriage located some distance from the stop in the direction of the movement of the carriage, the stop being also located a greater dis-

tance from the chuck than is the combined parting and shaping tool, substantially as set forth.

2. In an automatic turning-machine, the combination with a

2. In a machine of the class described provided with a rotary beater, a horizontally-adjustable rotary breaker-plate, a grinding-

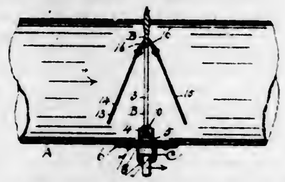
3. A machine or apparatus for the purpose specified, having a laterally-vibrating, inclined, covered chute, provided with a heating-

Claim.—1. A furnace of the class described having a plurality of kettles, disposed one above another and spaced apart, and means

tance from the chuck than is the combined parting and shaping tool, substantially as set forth.

2. In an automatic turning-machine, the combination with a tubular rotative clutch-body, of a longitudinally-movable clutch therein, a belt-pulley surrounding the clutch-body, two screws in said pulley at opposite ends thereof, the inner ends of which screws are made conical, the clutch-body having two inverted conical holes for receiving the conical ends of said screws, the distance between the points of the screws being less than the distance between the lowest parts of the inverted conical holes in the clutch-body, substantially as set forth.

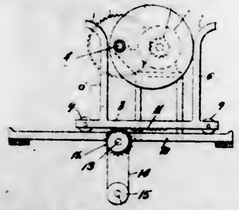
813,188. **PIPE-DAMPER.** HUGH WHITHAM, Hamilton, Canada. Filed July 21, 1905. Serial No. 270,635.



Claim.—1. In a pipe-damper, a pipe, a circular damper provided with a central opening, a vertical pin extending from the upper part of the damper and through the pipe, hubs on the lower part of the damper and diametrically opposite to the pin, a hub secured to the lower part of the pipe, an arrow-handle, a vertical stem on the handle adapted to rotate in said secured hub and secured in the hubs of the damper, means on the handle to allow one quarter-turn of the same and the damper automatic wings adapted to swing from the upper part of the damper and to retain relative position with respect to each other and one of said wings being provided with a central opening

2. In a pipe-damper, a pipe, a circular damper provided with a central opening and adapted to rotate in the pipe, a hub secured to the lower side of the pipe, and provided with a side opening, means on the upper part of the damper, and on the lower part of the damper to allow the same to rotate, an arrow-handle extending through said hub, means on the handle to engage the walls of the opening of the pipe-hub to stop at one quarter-turn, automatic side wings adapted to swing together from the upper part of the damper and independently of the damper, and one of said wings being provided with a central opening.

813,189. **GEARING.** ERNEST WIGHTON, New York, N. Y. Filed Aug. 26, 1904. Serial No. 223,111.

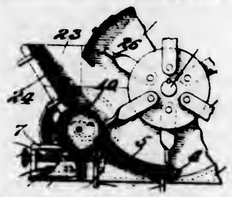


Claim.—In a device of the character described, a gear capable of an oscillatory motion, a rack having teeth for a distance less than the length of the periphery of the said gear, and means for reciprocating said rack in such a manner that a period of rest intervenes between each stroke in either direction, so as to alternately engage and disengage said gear, whereby an oscillatory motion is imparted to the said gear with periods of rest intervening between each movement in either direction.

813,190. **DISINTEGRATING-MACHINE.** MILTON F. WILLIAMS, St. Louis, Mo., assignor to Williams Patent Crusher & Pulverizer Company, St. Louis, Mo., a Corporation of Missouri. Filed Aug. 13, 1904. Serial No. 220,603.

Claim.—1. In a machine of the class described, the combination with a disintegrating-chamber, a hopper, a rotary breaker-plate and a grinding plate, of means for imparting synchronous movement to the rotary breaker-plate and grinding-plate for purposes of adjustment; substantially as described.

2. In a machine of the class described provided with a rotary beater, a horizontally-adjustable rotary breaker-plate, a grinding-plate concentrically adjustable with respect to the axis of rotation of the beater, the breaker-plate being adjacent to the entrance-opening of the machine and the grinding-plate being immediately below said breaker-plate, and means for imparting synchronous movement to the breaker-plate and grinding-plate; substantially as described.



3. In a machine of the class described provided with rotary beaters, a horizontally-adjustable rotary breaker-plate, a grinding-plate concentrically adjustable with respect to the axis of rotation of the beaters, and a connecting means between the two whereby the movement of one will impart movement to the other; substantially as described.

4. In a machine of the class described provided with rotary beaters, a horizontally-adjustable rotary breaker-plate, a grinding-plate concentrically adjustable with respect to the axis of rotation of the beaters, sliding bearings supporting the breaker-plate, and rigid connections between the sliding bearings and the grinding-plate; substantially as described.

5. In a machine of the class described provided with rotary beaters, a cylindrical casing having an opening in its periphery and a horizontally-adjustable rotary breaker-plate adjacent to said opening, a grinding-plate below the breaker-plate and concentrically adjustable with respect to the axis of rotation of the beaters, sliding bearings supporting the breaker-plate, and connecting means between the sliding bearings and the grinding-plate; substantially as described.

6. In a machine of the class described provided with a pivotally-mounted beater, the combination with a cylindrical casing having an opening in its periphery, of a horizontally-adjustable rotary breaker-plate, a grinding-plate concentrically adjustable with respect to the pivot of the beater, sliding bearings supporting the breaker-plate, and a screw for imparting motion to the sliding bearings whereby the rotary breaker-plate and the grinding-plate will be synchronously moved; substantially as described.

7. In a machine of the character described, the combination with a rotary breaker-plate and a grinding-surface, of means for simultaneously adjusting the breaker-plate horizontally and the grinding-surface in a curved path; substantially as described.

8. In a machine of the character described, the combination with a roller breaker-plate, of means for adjusting the same horizontally, a grinding-surface capable of concentric movement with respect to the axis of rotation of the pivoted revolving hammers which coöperate with the breaker-plate and said grinding-surface, and a pivotal connection between said roller breaker-plate and said concentrically-movable grinding-surface; substantially as described.

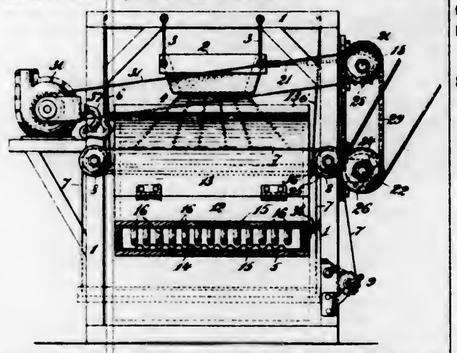
9. In a machine of the character described, the combination with pivoted revolving hammers, of a roller breaker-plate, a grinding-surface concentrically movable with respect to the axis of rotation of said hammers, a link connection between said grinding-surface and said roller breaker-plate, and means for adjusting said parts simultaneously; substantially as described.

813,191. **SAND-DRIER.** SAMUEL A. WILSON and ENOS A. BROWSON, Newburgh, N. Y. Filed Nov. 23, 1905. Serial No. 288,711.

Claim.—1. A machine or apparatus for the purpose specified, having an inclined, vibrating chute for the material to be dried, heating means in said chute, and a vibrating hopper above the higher receiving end of said chute, said hopper having a plurality of pendent delivery-spouts disposed abreast and which diverge laterally, substantially as and for the purpose specified.

2. A machine or apparatus for the purpose specified, having a laterally-vibrating hopper, a covered, inclined, laterally-vibrating chute below said hopper, said chute being provided with a corrugated metal bottom, an outlet at its lower end, and a coil of pipe for steam, the pipes of the coil extending lengthwise of the chute, means for imparting lateral vibrations to said chute, and means for removing vapor from the covered chute.

3. A machine or apparatus for the purpose specified, having a laterally-vibrating, inclined, covered chute, provided with a heating-coil, the pipes of which extend lengthwise of the chute, and a corrugated sheet-metal bottom below said coil, cushioning-springs on the sides of said chute, means for varying the inclination of said chute, means for supplying the material to the upper end of the chute, and means for removing vapor from the chute.



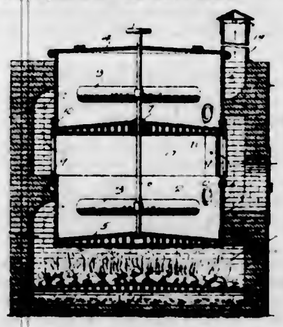
4. A machine or apparatus for the purpose specified, having a frame, a receiving-hopper suspended in the frame and provided with laterally-divergent and pendent outlets, means for imparting lateral vibrations to said hopper, an inclined chute suspended in the frame and adapted to receive the material from the hopper, said chute having a corrugated metal bottom plate, a heating-coil above said bottom plate, a cover composed of hinged flaps and the hood 13, an exhausting device for removing vapor from the chute, said device being connected with the interior of said hood, and means for imparting lateral vibrations to said chute.

5. A machine or apparatus for the purpose specified, having a frame, an inclined covered chute, in said frame, steam-pipes disposed lengthwise in the chute, means for agitating the chute, means for supplying material to be dried to the upper end of said chute, and an exhaust-fan for removing from the chute the vapors arising from the drying material.

6. A machine or apparatus for the purpose specified, having a frame, a suspended and inclined covered chute in said frame, said chute being lined with non-conducting material and having a bottom provided with channeled metal, the channels extending lengthwise of the chute, heating means comprising a plurality of steam-pipes extending along the said channels in the bottom of the chute, means for supplying material to the upper end of said chute, and means for removing the vapors arising from the drying material.

7. A machine or apparatus for the purpose specified, having a frame, a suspended and inclined chute suspended in said frame and linked to the frame at one side near its middle, means for agitating said chute, means for heating material flowing down said chute, means for supplying material to be dried to the upper end of said chute, and means for removing from said chute the vapors arising from the drying material.

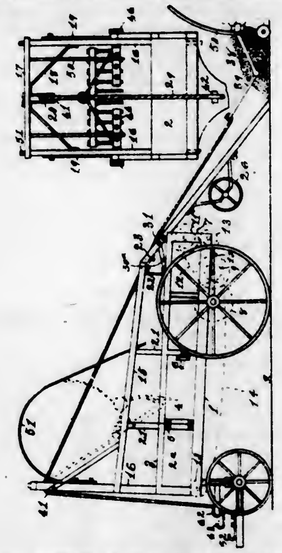
813,192. **PLASTER-KETTLE.** SAMUEL W. WOMACK, Laramie, Wyo. Filed Aug. 24, 1905. Serial No. 275,625.



Claim.—1. A furnace of the class described having a plurality of kettles, disposed one above another and spaced apart, and means to cause the heated products of combustion to continue to pass under and through the heated kettles.

2. A furnace of the class described having a plurality of kettles, disposed one above another and spaced apart, means to cause the heated products of combustion to continue to pass under and through the heated kettles, and means to discharge the material from the upper kettle into the lower kettle.

813,193. **LOADING DEVICE FOR DIRT, MANURE, &c.** GEORGE H. YOUNG, Welcome, Wis. Filed Sept. 29, 1905. Serial No. 280,593.



Claim.—1. A loading device for dirt, manure, &c., comprising a wagon, a wagon-box thereon, a rail at each side of the box at a distance above its side-boards and of a length nearly equal to said box, sheave-pulleys supported at the forward end of said box, one above and one below the same, an apron extending at a suitable inclination from the rear end of said rails to the ground, a carrier for gathering the material to be loaded, a roller mounted for revolution, at each side thereof and arranged for traveling along said rails, a bail pivoted to said carrier, and a rope rove over said sheave-pulleys and being connected with said bail, substantially as described.

2. A loading device for dirt, manure, &c., comprising a wagon, a wagon-box thereon, a rail at each side of the box at a distance above its side-boards and of a length nearly equal to said box, an apron detachably connected to the rear ends of said rails and extending at a suitable inclination from said rails to the ground, a carrier for gathering the material to be loaded, a roller mounted for revolution upon each side thereof and arranged for traveling along said rails, a bail pivoted to said carrier, sheave-pulleys suitably supported at the forward end of said wagon-box one above and one below the same, and a rope rove over said pulleys and being connected with said bail, substantially as set forth.

3. A loading device for dirt, manure, &c., comprising a wagon, a wagon-box thereon, a rail at each side of the box at a distance above its side-boards and of a length nearly equal to said box, an apron detachably connected to the rear end of each rail and extending at a suitable inclination from said ends to the ground, a roller mounted transversely of said apron for revolution in the side rails thereof, near the upper end of said apron, and having its upper surface slightly above the upper suface of said apron, a carrier for gathering the material to be loaded, a roller mounted for revolution at each side of said carrier and arranged for traveling along said rails, a bail pivoted to said carrier, sheave-pulleys suitably supported at the forward end of said wagon-box, one above and one below the same, and a rope rove over said pulleys and being connected with said bail, substantially as described.

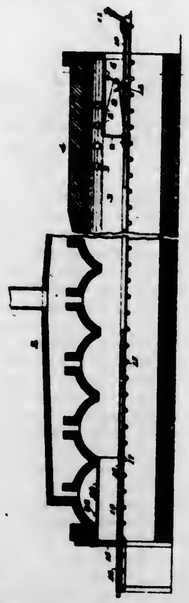
4. In a loading device for dirt, manure, &c., adapted for use

4. In a loading device for dirt, manure, &c., adapted for application to a manure unloading or distributing wagon, a rail arranged above each side-board at a distance above the same and extending from their forward end to near the rear end of said box, an apron detachably connected to the rear end of each rail, a board arranged transversely of said apron near the upper end thereof and being hinged thereto for protecting the beater, or distributing-drum of said wagon from the carrier when delivering the loading material to said distributing-wagon, substantially as set forth.

5. In a carrier for a loading device for loading dirt, manure, &c., a suitable head-piece therefor, suitable handles attached thereto, means secured to said head-piece for gathering and holding the material to be loaded, spindles secured to the carrier at each side thereof at a point substantially in the horizontal plane of the free, or outer end of said carrier and perpendicularly under said carrier head-piece, a roller mounted upon each spindle, and a bail pivoted to said carrier at a point forward of said rollers and above the plane of the bottom of said carrier, substantially as described.

6. In a carrier for a loading device for loading dirt, manure, &c., a suitable head-piece therefor, suitable handles attached thereto, means secured to said head-piece for gathering and holding the material to be loaded, spindles secured to the carrier at each side thereof at a point substantially in the horizontal plane of the free, or outer end of said carrier and perpendicularly under said carrier head-piece, a roller mounted upon each spindle, a flange upon the outer end of each roller, flaring outward therefrom and of greater diameter than said roller, and a bail pivoted to said carrier at a point forward of said roller and above the bottom of said carrier, substantially as set forth.

813,194. **LEER.** WILLIAM M. ANDERSON, Pittsburg, Pa. Filed Aug. 16, 1905. Serial No. 274,377.



Claim.—1. In a leer, a movable casing, adapted to inclose the glass, and to be drawn outwardly with the glass, and to be pushed back into the leer, leaving the glass outside the leer, substantially as specified.

2. In a leer, a movable casing adapted to inclose the glass in the leer, having an open end to permit the passage of the glass in the leer to the interior of the casing, and having a door adapted to keep the outer end of the leer closed, said casing being adapted to be drawn outwardly with the glass and to be pushed back into the leer, leaving the glass outside the leer, the door being opened to permit the retraction of the casing; substantially as specified

3. In a leer, an inclosed entry located within the leer, a door secured to the outer end of longitudinal and pivoted arms, and devices for raising and lowering the arms; substantially as specified.

4. In a leer, a longitudinally-movable casing, supported by rollers mounted on tracks secured to the side walls of the leer, said casing being adapted to inclose the glass during its passage from the leer substantially as specified.

813,195. **REFRIGERATING MEANS.** JOHN BECK, Ashland, Wis. Filed June 4, 1904. Serial No. 211,120.

Claim.—1. A refrigerator-house having oppositely-disposed drip-collectors presenting a central opening therebetween, and side openings adjacent to the side walls of said house, said drip-collectors being inclined toward said central opening, joists disposed transversely with respect to said central opening and supported on said drip-collectors, bars constituting gratings and resting on said joists, side hoods projecting from the side walls of said house and overhanging the outer edges of said drip-collectors, a central hood disposed over said central opening and overhanging the adjacent edges of said drip-collectors, the outer edge faces of said drip-collectors inclining inwardly in an upward direction whereby they facilitate the movement of air toward said central opening and across the upper faces of said drip-collectors, the inner edge faces of said drip-collectors being inclined downward away from the central line of said house whereby they tend to direct a descending air-current laterally.

2. A refrigerator-house having oppositely-disposed drip-collectors presenting a central opening therebetween and side openings adjacent to the side walls of said house, said drip-collectors being inclined toward said central opening and having inclined edge faces at said central opening adapted to facilitate the divergence of air-currents descending at said central opening, said drip-collectors further having inclined side edges at said side openings adapted to facilitate an inward or central movement of an air-current rising at the side walls of said house, ice-gratings supported on said drip-collectors, hoods overhanging the edges of said drip-collectors at said openings, and hinge door-sections attached below said openings and facilitating the flow of air-currents therethrough.

813,196. **FLY-PAPER.** JULIUS H. BIRD, San Francisco, Cal., assignor to C. A. Maydwell, San Francisco, Cal. Filed June 19, 1905. Serial No. 265,963.

Claim.—A new article of manufacture, comprising a plate having a surrounding upturned rim, said plate made of pulp or the like, sized or otherwise rendered non-absorbent, the bottom of said plate coated with a suitable sticky mixture, the surrounding rim being left uncoated to form a barrier against the escape of the sticky mixture, and a protective sheet of substantially the same diameter as the plate, laid thereon and pressed into contact with the mixture and capable of being rolled back to expose a portion of the coated part of the plate, said protective sheet being non-absorbent, and having a rim portion which corresponds to the uncoated rim of the plate thereby enabling several plates to be piled one on the other without one plate sticking to the other.

813,197. **HOSE-SUPPORTER.** HELEN W. CARR, New York, N. Y. Filed Mar. 6, 1905. Serial No. 248,702.

Claim.—1. A hose-supporter comprising a hanger folded upon itself at the lower end and forming a bight, a clasp attached to the free end of the hanger and embracing the same for slidable adjustment thereon, a loop in the bight of the hanger, a leg-band, a strap

attached at spaced points to the leg-band and passing through the loop, and another strap attached to the hanger above the slidable clasp thereon, said last-mentioned strap being provided with a stocking-clasp.

2. A hose-supporter comprising a hanger having its lower end folded upon itself and forming a bight, a clasp slidable on the hanger for varying the operative length thereof, means at the upper part of the hanger for attaching the same to a corset, a leg-band, an elastic strap connecting the leg-band with the bight of the hanger, and another strap attached to the hanger between the clasp and the corset-attaching means.

3. A hose-supporter comprising a hanger having one end doubled upon itself and producing a bight, a clasp adjustable on the hanger for varying the operative length thereof, means for attaching the hanger to a corset, a strap fastened to the hanger between the clasp and the corset-attaching means, a leg-band, a loop in the bight of the hanger, and an elastic strap fitted in the loop and having its ends secured at separated points to the leg-band.

813,198. **BOTTLE-CLOSURE.** ARISTODEMO CELENZA and DOMENICO CELENZA, New York, N.Y. Filed Oct. 26, 1905. Serial No. 284,457.

Claim.—1. In a bottle-closure, a cork, a rod extended through the same and terminating at its outer end in a hook portion, a loop for engaging the said hook portion, a ring having swinging connection with the loop, and a locking-plate mounted to rotate on the rod below the hook.

2. In a bottle-closure, a cork, a rod extended longitudinally through the cork and terminating at its outer end in a hook portion, a locking-plate mounted to rotate on the rod below the hook portion the said plate having a notch at one side, a loop for engaging with the hook portion, and a ring having swinging connection with the loop.

3. In a bottle-closure, a cork, a rod extending longitudinally through the cork and having a head at its inner end, a plate arranged between said head and the inner end of the cork, a hook on the outer end of the rod, a locking-plate mounted to turn on the rod below the hook and having a notch at one side, a loop adapted for removable engagement with said hook when the notch portion of the plate is turned underneath the free end of the hook, and a ring having swinging connection with the loop.

813,199. **MANUFACTURE OF ENGLISH BEERS OR MALT LIQUORS.** NIELS H. CLAUSSEN, Copenhagen, Denmark. Filed May 17, 1904. Serial No. 208,464.

Claim.—1. As a step in the production of English beers, such as ale, stout and porter, the addition thereto of cultures of the brettanomyces, in order to produce the flavor and condition of English beers, substantially as set forth.

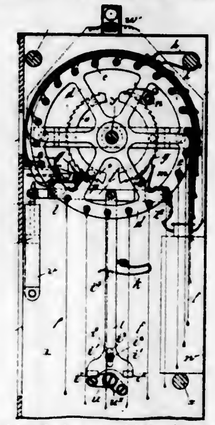
2. In the production of English beers, such as ale, stout and porter, the process which consists in adding thereto a mixture of yeast and cultures of brettanomyces, substantially as set forth.

3. In the production of English beers, such as ale, stout and porter, the addition thereto of cultures of brettanomyces to beer which has been primarily fermented in any suitable way, substantially as set forth.

4. In the production of English beers, such as ale, stout and porter, pasteurizing the beer and then adding cultures of brettanomyces to the pasteurized beer, substantially as set forth.

813,200. **ADVERTISING DEVICE.** PAULIN COUPETTE, Cologne, Germany. Filed June 13, 1904. Serial No. 213,133.

Claim.—1. An advertising device, comprising a drum constructed of duplicate rigid disks having corresponding sockets therein, rods of spring material having the ends thereof reduced and seated in the said sockets, advertising-sheets each having an edge thereof looped and slipped over one of the spring-rods, and means for imparting an intermittent rotary motion to the drum.



2. An advertising device comprising a drum, advertising-sheets carried by the drum, means for imparting motion to the drum and a plurality of springs having their free ends arranged one behind the other and bent or beveled, the said ends of the springs bearing on the advertising-sheets, and serving to hold and release the same.

3. An advertising device, comprising a drum, advertising-sheets supported thereon, and means for imparting an intermittent rotary motion to the drum, including a horizontal lever pivoted at one end, a rod having vertical guided movement and pivoted at its upper end to the lever, the said rod terminating at its lower end in branches each provided with a shoe, a two-armed lever mounted to oscillate, the arms of the lever being adapted to alternately engage the said shoes to reciprocate the rod, a pin projecting from said rod, a spring exerting downward pressure on said pin, a ratchet-wheel on the shaft of the drum, and an actuating-pawl therefor, carried by the said horizontal lever.

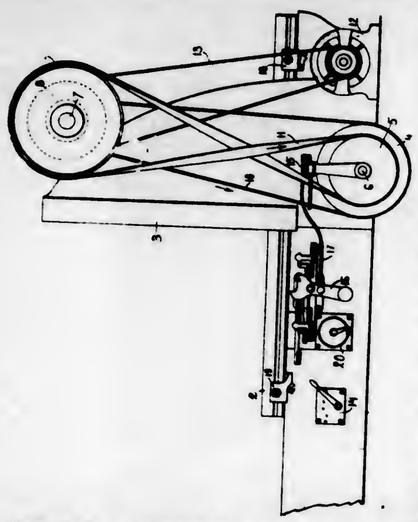
4. An advertising device, comprising a drum, advertising-sheets carried thereby, a ratchet-wheel, an actuating-pawl engaging the ratchet-wheel, means for moving the pawl for imparting intermittent rotary motion to the drum, a pawl engaging the ratchet-wheel for preventing retrograde movement of the drum, and a stop device for the drum comprising a second ratchet-wheel having its teeth disposed in an opposite direction to the teeth of the first-mentioned ratchet-wheel, and a pawl adapted to be carried into engagement with the teeth of said second ratchet-wheel on the completion of each movement imparted to the drum by the actuating-pawl.

5. An advertising device comprising a drum, advertising-sheets carried thereby, a pivoted vertically-swinging lever, a pawl carried thereby, a ratchet-wheel actuated by the pawl for imparting an intermittent rotary motion to the drum, a pawl engaging said ratchet-wheel for preventing retrograde movement of the drum, and a stop device for the drum, comprising a second ratchet-wheel having its teeth disposed in an opposite direction to the teeth of the first-mentioned ratchet-wheel, a pivoted pawl adapted to be carried into engagement with the said second ratchet-wheel by the movement of said lever, and a spring for normally holding the pawl out of such engagement.

6. An advertising device comprising a drum, advertising-sheets carried thereby, means for imparting an intermittent rotary motion to the drum including a ratchet-wheel mounted on the shaft of the drum, a swinging lever and a pawl carried by the lever and engaging the ratchet-wheel to move the same, a pawl engaging the ratchet-wheel to prevent retrograde movement of the drum, and a stop device comprising a ratchet-wheel mounted on the shaft of the drum and having its teeth disposed in a direction opposite the teeth of the first-mentioned ratchet-wheel, and a pawl normally held out of engagement with the said ratchet-wheel and adapted to be moved into engagement therewith by the movement of the actuating-lever for the drum.

813,201. **SPEED-CONTROLLING SYSTEM.**

813,201. SPEED-CONTROLLING SYSTEM. ADOLPH L. DE LEEUW, Hamilton, Ohio. Filed Aug. 7, 1905. Serial No. 273,991.



Claim.—1. In a speed-controlling system, the combination, substantially as set forth, of a machine having a part to be moved at differing rates of speed, a continuously-running motor for driving the machine part, transmitting connections between the motor and the machine part, a controller for varying the speed of the motor, and connections between the controller and a moving part of the machine for causing the movement of said part to automatically adjust the controller and effect variations in the speed of the continuously-running motor.

2. The combination, substantially as set forth, with a machine provided with automatic reversing mechanism, a motor running continuously in one direction for actuating the machine, transmitting mechanism between the motor and the machine, a controller for varying the speed of the motor, and connections between the controller and a moving part of the machine, of means for causing said connections to effect an adjustment of the controller at each reversal of the machine, whereby the speed of the continuously-running motor and the machine may differ upon the forward and backing strokes of the planer.

3. The combination, substantially as set forth, with a machine provided with automatic reversing mechanism, a motor running continuously in one direction for actuating the machine, transmitting mechanism between the motor and the machine, a controller for varying the speed of the motor, and connections between the controller and a moving part of the machine, of means for causing said connections to adjust the controller in the motor-slowing direction before and in the motor-quickening direction after each reversal whereby the continuously-running motor causes the machine to reduce its rate of motion prior to and increase its rate of motion subsequent to each reversal.

4. The combination, substantially as set forth, with a machine provided with automatic reversing mechanism, a motor running continuously in one direction for actuating the machine, transmitting mechanism between the motor and the planer, arranged to cause a given speed of the motor to give to the machine a backing speed in excess of its forward speed, a controller for varying the speed of the motor, and connections between the controller and a part of the machine, of means for causing said connections to effect an adjustment of the controller at each reversal of the machine, whereby the speed of the continuously-running motor and the machine may differ upon the forward and backing strokes.

5. The combination, substantially as set forth, with a reciprocating machine provided with an automatic reversing mechanism, a motor running continuously in one direction for actuating the planer, transmitting mechanism between the motor and the planer, a controller for varying the speed of the motor, and mechanism connected with the controller for adjusting it, of means connected with said controller-adjusting mechanism and adapted to be engaged by dogs on a reciprocating part of the machine before and after each reversal of the motion of said part.

6. The combination, substantially as set forth, with a planing-machine provided with automatic reversing mechanism, a motor running continuously in one direction for actuating the planer, transmitting mechanism between the motor and the planer, a controller for varying the speed of the motor, and connections from the controller for adjusting it, of means whereby the planer-dogs engage with and disengage from said controller-adjusting mechanism prior to the reversal of table motion, and means for causing the planer-dogs to engage with and disengage from said controller-adjusting mechanism subsequent to the reversal of table motion.

7. The combination, substantially as set forth, with a planing machine provided with automatic reversing mechanism, a motor running continuously in one direction for actuating the planer, transmitting mechanism between the motor and the planer, a controller for varying the speed of the motor, and connections from the controller for adjusting it, of means for causing the planer-dogs to engage with and disengage from said controller-adjusting mechanism prior to and again subsequent to the reversal of table motion, and means for variably adjusting the time of disengagement of the dogs from said controller-adjusting mechanism after the reversal of the table motion.

8. The combination, substantially as set forth, with a planing-machine provided with automatic reversing mechanism, a motor running continuously in one direction for actuating the planer, transmitting mechanism between the motor and the planer, a controller for varying the speed of the motor, and connections from the controller for adjusting it, of means for causing the planer-dogs to engage with and disengage from said controller-adjusting mechanism prior to and again subsequent to the reversal of table motion, and means for variably adjusting the time of disengagement of the dogs from said controller-adjusting mechanism after the reversal of the table motion, said variable adjusting means being independent as regards each dog, whereby the release of each dog from the controller-adjusting mechanism after the reversal of table motion may occur under selected conditions independent of the corresponding adjustment for the other dog.

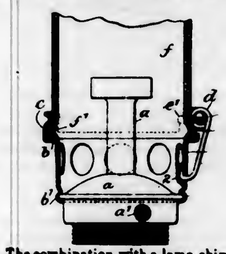
9. The combination, substantially as set forth, with a planing-machine provided with automatic reversing mechanism, a motor running continuously in one direction for actuating the planer, transmitting mechanism between the motor and the planer, a controller for varying the speed of the motor, and connections between the controller and a part of the planer moving in unison with its table, of means incorporated in said connections whereby a planer-dog will adjust the controller to motor-slowing position, then effect the reversal of the table motion and then adjust the controller to motor-quickening position.

10. The combination, substantially as set forth, with a planing-machine provided with automatic reversing mechanism, a motor running continuously in one direction for actuating the planer, transmitting mechanism between the motor and the planer, a controller for varying the speed of the motor, and connections from the controller for adjusting it, of means whereby the planer-dogs actuate the planer-reversing tumbler and the controller-adjusting mechanism at different times whereby the controller becomes adjusted before and after the reversals of planer motion.

11. The combination, substantially as set forth, with a planing-machine provided with an automatic reversing mechanism, a motor running continuously in one direction for actuating the planer, transmitting mechanism between the motor and the planer, a controller for varying the speed of the motor, and connections between the controller and a part of the planer moving in unison with its table, of means for causing each planer-dog to adjust the controller to motor-slowing position and then to effect the reversal of table motion and then adjust the controller to motor-quickening position

12. The combination, substantially as set forth, with a planing-machine provided with an automatic reversing mechanism, a motor running continuously in one direction for actuating the planer, transmitting mechanism between the motor and the planer, a controller for varying the speed of the motor, and connections between the controller and a part of the planer moving in unison with its table, of means for causing said connections to slow the table motion before reversal thereof and to quicken the table motion after the reversal thereof, and means independent for each dog for adjusting selectively the degree of said quickening whereby the continuously-running motor moves the table at speed decreased before reversal and at speed increased after reversal and whereby the table speeds after reversal may be selectively different for the cutting and the backing stroke.

813,202. LAMP-BURNER. FREDERICK W. DARNELL, New York, N. Y., assignor to The Drumel Railway Lamp Works, New York, N. Y., a Corporation of New York. Filed Sept. 20, 1905. Serial No. 279,346.



Claim.—1. The combination with a lamp-chimney ribbed at one end, of a lamp-burner and its gallery, a recessed support-arm at one side of said gallery, a wire helix at the opposite side adapted to engage the rib of said chimney and hold the same with a continuous pressure and points of support for the lower end of the chimney at opposite ends on the helix.

2. The combination with a lamp-chimney ribbed at one end, of a lamp-burner and its gallery, a recessed support-arm at one side of said gallery, a wire helix at the opposite side adapted to engage the rib of said chimney and hold the same with a continuous pressure, points of support for the lower end of the chimney at the opposite ends of the helix and a wire of curved form passing through the helix to limit its movement with the respective ends of the wire secured to said opposite places of support.

3. The combination in a lamp-burner with a gallery having an arm curved in plan conforming to the curve of the gallery, curved in vertical cross-section and located at one side of the gallery, of a double helix at the opposite side of the gallery, arms from the ends of the double helix lying side by side and passing down the gallery and at their free ends soldered thereto, a curved wire passing through the double helix, support-arms rising from the gallery at opposite sides or ends of the helix and to which the respective ends of the said wire are secured, and a lamp-chimney ribbed at its lower end and adapted to be received in the recessed arm at one side and by the helix at the other side with the lower end of the chimney resting upon the support-arms.

813,203. MUFFLER. GUSTAVE B. FRANQUIST, New York, N. Y. Filed Sept. 13, 1905. Serial No. 278,267.

Claim.—1. A muffler comprising a drum or casing having a perforated diaphragm transverse to the drum or casing and a wall whereby the same is divided into a receiving-chamber, an equalizing-chamber and an exit-chamber, and tubes for connecting the exit-chamber with the equalizing-chamber at a point in the region of the center of the latter.

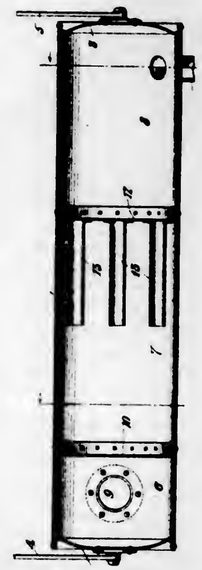
2. In a muffler, a receiving-chamber having a diaphragm with a multitude of perforations therein, an equalizing-chamber in which said perforations are axially directed, said chamber having an end wall substantially opposite said perforations, and an exit-chamber in communication with the equalizing-chamber in the region of its center.

3. In a muffler, a receiving-chamber having a perforated diaphragm, an equalizing-chamber having a plurality of tubes extending into its central portion and directed toward said diaphragm, and an exit-chamber with which said tubes communicate.

4. In a muffler, a plurality of chambers separated by perforated diaphragms, the central chamber being arranged to reflect the exhaust-wave upon itself and produce wave interference, and an outlet near the central region of said chamber.

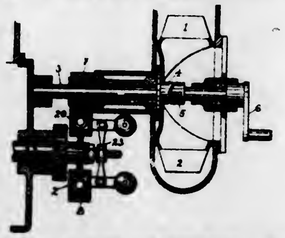
5. In a muffler, a receiving-chamber having a diaphragm with a multitude of perforations uniformly distributed over the face thereof, and formed to transmit an exhaust-wave in a forwardly-progressing plane, a wall in the path of said wave arranged to reflect the same upon itself, and a tube forming an outlet at a loop of the resulting wave interference produced.

6. In a muffler, a drum or casing having an inlet connection, a diaphragm whereby the exhaust-wave is transformed into a forwardly-progressing uniform wave, a wall in the path of said wave arranged to reflect the same upon itself, and a plurality of outlet-tubes having their inlet-orifices between the said diaphragm and wall.



7. In a muffler, a drum or casing of substantially cylindrical form having a diaphragm near one of its ends provided with a multitude of circular perforations directed axially of the drum, an inlet connection into the chamber thus formed, a second wall having a plurality of tubes projecting toward said diaphragm and arranged at a considerable distance therefrom whereby a wave is formed which impinges against said wall, and an exit-chamber in communication with said tubes and forming the final end of said drum or casing and in communication with the atmosphere.

813,204. ENGINE-DRIVEN BLOWER FOR EXPLOSION-ENGINES. LEE A. FRAYER and WILLIAM J. MILLER, Columbus, Ohio. Filed Jan. 11, 1905. Serial No. 240,670.



Claim.—In an air-cooled explosion-engine, a secondary starting-shaft, a blower mounted thereon, a small pinion on said shaft, a prime moving shaft, a relatively large cushioned gear-wheel thereon meshing with said pinion and adapted to form a yielding connection between said blower and said prime moving shaft, and whereby the speed of said blower is greatly accelerated.

813,205. CROSS-TIE AND MEANS FOR HOLDING TRACK-RAILS THEREON. EDWARD A. GILLCHRIST, McKeesport, Pa. Filed Aug. 17, 1905. Serial No. 274,581.

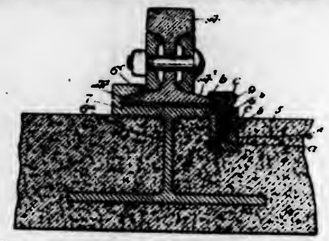
Claim.—1. The combination with a tie-body formed of concrete or the like, of two bracket-stands each comprising an anchor-plate of considerable area, a transverse web-plate erected on the anchor-plate, a base-plate on the upper end of the web-plate, an overhanging abutment-flange at one end of the base-plate, an anchor-block depending from the other end of the base-plate, and offset headed bolts

body of heated liquid, spraying said plates after emerging from said

means for gripping a portion of the bottom and withdrawing the

plate having a groove with straight and curved portions for the re-

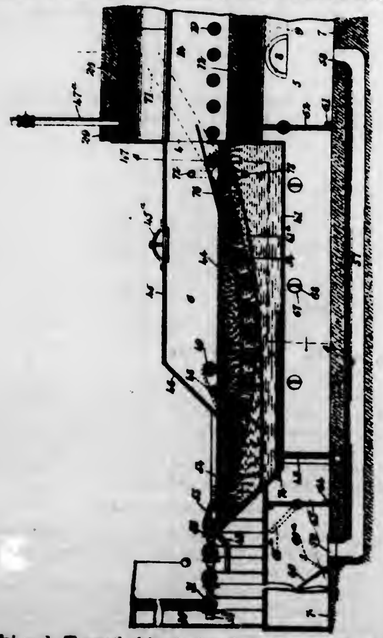
pending from the other end of the base-plate, and offset headed bolts screwing into threaded perforations in the anchor-block.



2. The combination with a tie-body formed of concrete or the like, of two metal bracket-stands, each comprising an oblong rectangular anchor-plate, a transverse web-plate erected on the anchor-plate near its center, a base-plate on the upper end of the web-plate, an overhanging abutment-flange at one end of the base-plate and spaced therefrom, an anchor-block formed transversely on the opposite end of the base-plate and depending therefrom, said block having threaded perforations therein, offset headed screw-bolts engaging the threaded perforations, said bolts having a longitudinal groove in each one, and a key engaging each groove and adapted to hold the bolt from turning.

3. The combination with a tie-body formed of concrete or the like, and with a track-rail, of a metal bracket-stand for support of the track-rail, comprising an oblong anchor-plate, a web-plate erected on the anchor-plate, a base-plate on the upper end of the web-plate, said base-plate seating on the tie-body and the web and anchor-plates embedded therein, a transverse hook-flange on one end of the base-plate, said flange hooking upon the base-flange of the track-rail along one side edge thereof, an anchor-block depending from the other end of the base-plate, keeper-bolts having offset heads and screwing into tapped perforations in the anchor-block, and keys engaging grooves in the keeper-bolts for holding said bolts from turning.

813,206. **PROCESS OF TREATING METALS.** HARRY H. GOODELL, Indiana Harbor, Ind. Filed July 7, 1905. Serial No. 268,688.



Claim.—1. The method herein described of treating plates of sheet iron and steel, which consists in passing the same through a body of heated liquid, spraying said plates after emerging from said liquid, raising the temperature of said plates while subjecting them to the vapor of said liquid so as to prevent oxidation of said plates, and finally allowing said plates to emerge into the atmosphere and gradually cool.

2. The method herein described of treating plates of sheet iron and steel, which consists in passing the same through a body of heated liquid serving as a vapor seal, subjecting said plates to the action of a vapor restrained by said vapor seal, increasing the temperature of said vapor, and thereby increasing the temperature of said plates, and finally allowing said plates to emerge into the air and to cool.

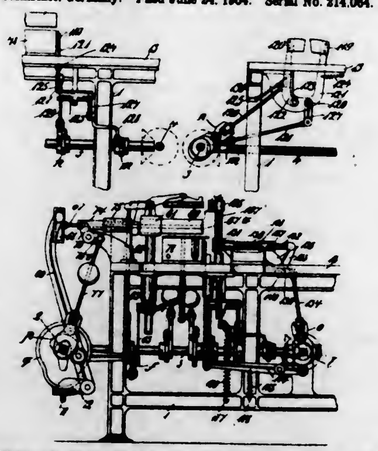
3. The method herein described of treating sheets of iron and steel, which consists in warming said plates, washing the same, subjecting said plates to the action of a body of vapor treated to different extents in different portions thereof, the lowest temperature of said vapor approximating 400° Fahrenheit and the highest temperature thereof approximating 900° to 1,200° Fahrenheit and finally allowing said plates to emerge into the open air and then to cool.

4. The method herein described of treating sheet iron and steel, which consists in passing the same slowly through a body of vapor heated unequally in different portions thereof, the iron and steel being first exposed to portions of low temperature and then to portions of successively higher temperature, and then allowing said iron and steel to emerge into the atmosphere and cool.

5. The method herein described of treating sheet iron and steel, which consists in passing the same through a volatile liquid, causing said liquid to vaporize so as to leave said iron and steel dry, gradually raising the temperature of said iron and steel by passing the same through a body of vapor heated unequally in its different portions, and finally allowing said iron and steel to cool in contact with the open air.

6. The method herein described of treating plates of metal, which consists in subjecting the same to the action of an aeriform body, of which different portions are heated unequally, said plates being first brought into contact with portions of said aeriform body having comparatively low temperatures and passed successively along to portions having higher and higher temperatures, and finally causing said plates to emerge into the open air.

813,207. **MACHINE FOR MAKING PAPER BAGS.** OTTO HESSER, Cannstatt, Germany. Filed June 24, 1904. Serial No. 214,064.



Claim.—1. In a paper-bag machine, a folding-box, a core movable thereinto, means for feeding a sheet of paper over the box, means for supplying an adhesive to the paper in advance of its arrival over the box, means for depressing the core and thus folding an intermediate portion of the sheet within the box, means for folding over the upstanding edges of the paper, means for pressing the longitudinal seam so formed, means for folding one end of the paper over the core to form a bottom, means for forcing the bag from the core, means for engaging and holding opposite sides of the bag, means for crossing the remaining sides inward, mechanism for moving the engaging and clamping means toward each other during such crossing operation to flatten all but the bottom of the bag and

means for gripping a portion of the bottom and withdrawing the same from the crossing and pressing mechanism.

2. In a machine of the class described, an adhesive-applying device including a paste-roller, a pair of stamps normally arranged in parallel relation with each other and the roller, means for moving the stamps over the roller, means for moving one of the stamps to dispose them in angular relation, and means for depressing said stamps; substantially as described.

3. In a machine of the class described, an adhesive-applying device including a paste-roller, a horizontally and vertically movable carriage, a pair of stamps arranged on the carriage in parallel relation and movable over the roller, and means for moving one of the stamps into angular relation to the other during such movement; substantially as described.

4. In a machine of the class described, an adhesive-applying device including a paste-roller, a horizontally and vertically movable carrier, a pair of stamps, one secured to the carriage and the other pivoted thereto, both of said stamps being normally disposed in parallel relation and movable over the paste-roller, an arm carried by the pivoted stamp and having a cam-slot, and a stationary pin engaging in said cam-slot to effect pivotal movement of the stamp; substantially as described.

5. In a machine of the class described, a movable paper-carriage, a paste-roller, a stamp pivoted at one side of the path of movement of the carriage, and means for swinging the stamp on its pivot between the roller and to an applying position at an angle to the path of movement of the carriage; substantially as described.

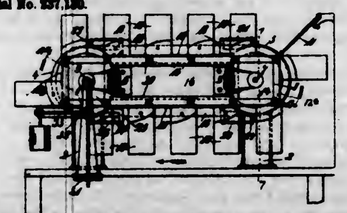
6. In a machine of the class described, the combination with a pair of pressing-plates between which the formed bag is fed, of means for engaging and clamping two opposite edges of the open end of the bag against said plates, creasing member for engaging the free sides of the bag, and means for forcing one plate toward the other to flatten the bag; substantially as described.

7. In a machine of the class described, a bag creasing and flattening means, including flattening-plates, grippers for holding two of the sides of the bag to the plate, means for creasing the two remaining sides of the bag, and means for moving said plates toward each other; substantially as described.

8. In a machine of the class described, the combination with bag creasing and flattening devices, of a feeder, a gripping-jaw carried thereby, means for actuating the jaw to engage a portion of the bottom of a bag, means for moving the feeder and gripping-jaw, and means for removing the bag from the jaw and feeder; substantially as described.

9. In a machine of the class described, the combination with an automatic bottom-gripper, of a segmental feeding-plate for removing the bag from the gripper, and a pair of flattening-rollers to which the bag is fed by said plate; substantially as described.

813,208. **CONVEYING MECHANISM FOR PAPER-BAG MACHINES.** OTTO HESSER, Cannstatt, Germany. Filed Dec. 16, 1904. Serial No. 237,139.



Claim.—1. In an apparatus of the class described, pivotally-connected links forming an endless conveyer, folding plates or mandrels carried thereby, pins projecting from the links, a conveyer-support, a plate having a continuous guiding-groove for said pins and means for resisting the passage of the latter in the groove.

2. In an apparatus of the class described, pivotally-connected links forming an endless conveyer, folding plates or mandrels carried thereby, pins projecting from the links, a conveyer-support, a plate having a guiding-groove with straight and curved portions for the reception of said pins, and means at the junction of the straight and curved portions of the groove for resisting the passage of the pins.

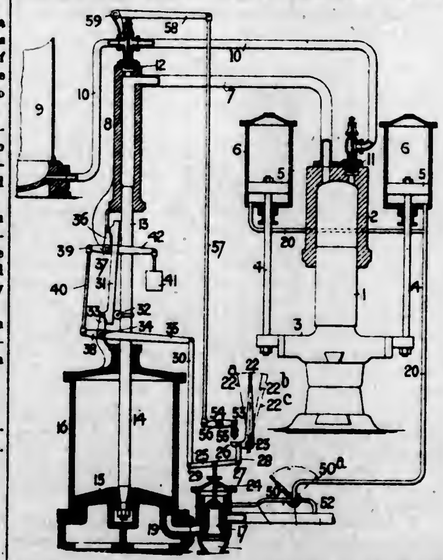
3. In an apparatus of the class described, pivotally-connected links forming an endless conveyer, folding plates or mandrels carried thereby, pins projecting from the links, a conveyer-support, a plate having a groove with straight and curved portions for the reception of said pins, and spring-pressed cam-levers at the junction of the straight and curved portions of the groove for resisting the passage of the pins.

4. In an apparatus of the class described, pivotally-connected links forming an endless conveyer, folding plates or mandrels carried thereby, pins projecting from the links, a conveyer-support, a plate having a groove with straight and curved portions, and pivotally-mounted spring-pressed levers having cam-shaped end portions for locking the pins at the junction of said straight and curved portions of the groove.

5. In an apparatus of the class described, pivotally-connected links forming an endless conveyer, folding plates or mandrels carried thereby, pins projecting from the links, a supporting-frame, a pair of shafts carried thereby, rectangular plates carried thereby and receiving the links, bell-crank levers carrying one of the shafts, and weights connected to the levers and tending to separate the shafts.

6. In a device of the class described, a link having a recessed rib, a clamp-plate, a bolt connecting the two, a detachable folding plate or mandrel having a slot for the reception of the bolt, and side strips for preventing lateral play of said plate or mandrel.

813,209. **STEAM HYDRAULIC INTENSIFIER.** THOMAS E. HOLMES, Sheffield, England, assignor of one-half to Davy Brothers Limited, Sheffield, England. Filed Mar. 8, 1905. Serial No. 248,964.



Claim.—1. In a hydraulic press working on the steam-intensifier system, the combination with the steam-piston of the intensifier, the valve for controlling the supply of steam to said piston, and a hand-lever whereby said valve is initially set, of mechanism including a movable bar, a reciprocatory device in contact therewith, and an intermediate resistance connected to said valve and hand-lever and controlled automatically by the steam-piston in such manner that the movement of said piston in performing its working stroke will cause the supply of steam to be cut off in accordance with the position to which the hand-lever has been set.

2. In a hydraulic press working on the steam-intensifier system, the combination with the steam-piston of the intensifier, the valve for controlling the supply of steam to said piston, and a hand-lever whereby said valve is initially set, of mechanism including a movable bar, a reciprocatory device in contact therewith, and an intermediate weight connected to said valve and hand-lever and controlled automatically by the steam-piston in such manner that the movement of said piston in performing its working stroke will cause the supply of steam to be cut off in accordance with the position to which the hand-lever has been set.

3. In a hydraulic press, working on a steam-intensifier system,

the combination with the steam-piston of the intensifier, of a valve for controlling the supply of steam to the piston, a hand-lever, a floating lever pivoted to the stem of the main valve and coupled by one end to the hand-lever, a movable bar connected to the other end of the floating lever, and means whereby the steam-piston may actuate the movable bar during its working stroke to close the steam-valve, substantially as described.

4. In a hydraulic press, the combination with the steam-piston of the intensifier of a so-called floating lever pivoted to the stem of the main steam-valve, and another lever to which one end of the floating lever is coupled, a movable bar connected to the other end of the floating lever, adapted to be acted upon by the steam-piston during its working stroke, to cause the main steam-valve to be closed in correspondence with the position to which the second-mentioned lever has been set, a double-acting piston coupled to said second-mentioned lever, a reciprocatory piston within the cylinder, a slide-valve adapted to admit fluid to the one side and exhaust it from the other side of said piston, alternately, a hand-lever, a coupling-rod attached to the said second-mentioned lever, and another so-called floating lever pivotally attached at its ends to the second-mentioned lever and said coupling-rod coupled at an intermediate point to the said slide-valve, to cause the piston to be arrested at that point in its travel, corresponding to the position to which the said hand-lever has been set.

813,210. DEVICE FOR DRESSING STONE. HENRY HUGHES and ROBERT HUGHES, Mount Vernon, N. Y. Filed Oct. 26, 1905. Serial No. 284,779.

Claim.—1. A stone-dressing tool, having corrugations extending across the two faces thereof, the corrugations upon one face being arranged at an angle to the corrugations on the opposite face.

2. A stone-dressing tool, having corrugations extending across the two faces thereof, the corrugations upon one face being arranged at a right angle to the corrugations on the opposite face.

3. A stone-dressing tool, having corrugations extending across the two faces thereof, the corrugations upon one face being arranged at an angle to the corrugations on the opposite face, and the tool being provided with a central hole.

4. A stone-dressing tool having parallel faces provided with corrugations, the corrugations upon one face being arranged at an angle to the corrugations on the opposite face, and the tool being provided with a central hole perpendicular to the parallel faces.

5. A stone-dressing tool having parallel faces provided with corrugations, the corrugations upon one face being arranged at an angle to the corrugations on the opposite face, and the two being provided with a central hole perpendicular with the parallel faces.

6. A stone-dressing tool having corrugations extending across the two faces thereof, the corrugations upon one face being arranged at an angle to the corrugations on the opposite face, and a holder having corrugations across one of its faces adapted to be engaged by either series of those on the tool.

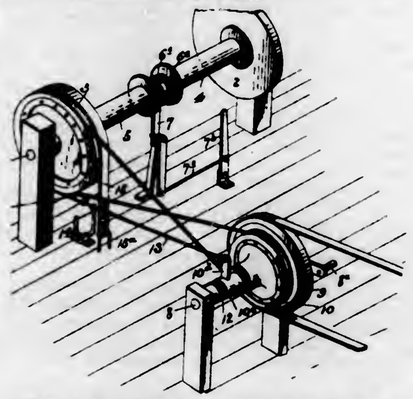
7. A stone-dressing tool, having corrugations extending across the two faces thereof in directions at right angles to each other, combined with a holder for the tool, having corrugations across one of its faces, adapted to be engaged by either series of those on the tool.

8. A stone-dressing tool, having corrugations extending across the two faces thereof, the corrugations upon one face being arranged at an angle to the corrugations on the opposite face, a holder for the tool having corrugations across one of its faces adapted to be engaged by either series of those on the tool, and a clamping member for securing the tool in place, the corrugations on one of its faces adapted for engagement with either of those on the tool.

9. A stone-dressing tool, having corrugations extending across the two faces thereof in directions at right angles to each other, combined with a holder for the tool, having corrugations across one of its faces, adapted to be engaged by either series of those on the tool, and a clamp member for securing the tool in place, having corrugations on one of its faces, adapted for engagement with either series of those on the tool.

10. A rectangular stone-dressing tool having corrugations extending across the two faces thereof in directions at right angles to each other, and provided with a central hole combined with a holder for the tool, having a vertical slot therein, a bolt extending through said hole and slot, a clamp carried by the bolt, and means for securing the parts together, said holder having corrugations engaged by one series of corrugations on the tool and said clamp having corrugations on the face thereof, engaging with the other series of corrugations on the tool.

813,211. DRILLING-MACHINE. JOHN P. JACOBS, Coalinga, Cal. Filed Aug. 22, 1905. Serial No. 275,202.



Claim.—1. A machine of the character described, comprising two loose drums, a common shaft bearing said drums, a rotary part fixed to said shaft, a clutch contrivance arranged upon said shaft, intermediately of said drums, a driving-pulley and its shaft, a frictional clutch arranged upon said driving-pulley shaft, means effective for transmitting motion from said driving-pulley to said frictional clutch, a brake-strap applicable to said rotary part and means for its actuation, a nut, a screw-threaded coupling equipped with said nut and effective for actuating said frictional clutch, and means forming connection between said nut and said brake-strap-actuating means.

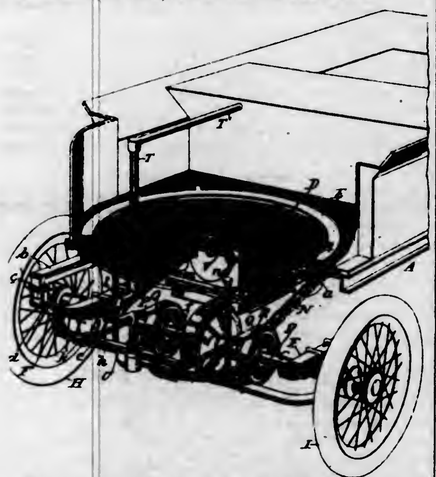
2. A machine of the character described, comprising a drill-line drum, a shaft bearing said drum, a clutch contrivance for effecting connection between said drum and shaft, a band or driving wheel, a frictional clutch adapted to have contact with said wheel, a shaft loosely equipped with said frictional clutch and bearing said band or driving wheel, means effecting connection between said driving-wheel and a rotary part fixed to the drum-shaft, a screw-threaded coupling equipped with a nut and effective for action between said frictional clutch and the shaft bearing said clutch, a brake-band engaging said rotary part, and a lever-and-rod connection between said nut and said brake-strap.

3. A machine of the character described, comprising a drum-equipped shaft having a fixed wheel, a brake-strap encompassing said wheel, a band-wheel, a second shaft equipped with said band-wheel, a frictional clutch loosely arranged upon the latter shaft, and fixed to a disk or pulley, a screw-threaded coupling for said frictional clutch equipped with a nut, means of connection between said pulley and said brake-strap-encompassed wheel, an arm-and-rod connection between said nut and a lever for actuating said brake-strap.

818,212. MILL-PICK. ROBERT JOHNSON, Cole, Tenn. Filed Jan. 14, 1905. Serial No. 241,207.

Claim.—A mill-pick comprising a sectional head composed of two plates each of which is provided on their inner faces with right-angular cut-away portions which serve to form a single socket when the sections are brought together, a single cutting-blade mounted in the socket and constructed of a thickness equal to size of the socket, said blade having its rear edge in direct contact with the vertical portions of the cut-away portions of the socket, and bolts passing solely through the two sections and having nuts thereon for securing said sections together, substantially as specified.

818,213. MOTOR-PROPELLED VEHICLE. WARREN S. JOHNSON, Milwaukee, Wis. Filed Nov. 10, 1904. Serial No. 232,165.



Claim.—1. In combination with the body of a vehicle, a turn-table; a divided driving-shaft carried by said turn-table; a motor for imparting rotation to said shaft; differential gear interposed between the motor and the shaft-sections; ground-wheels connected with the respective shaft-sections; and means whereby either wheel may be temporarily held against rotation while the other is left free to turn.

2. In a vehicle, the combination of a motor and a divided driving-shaft; differential gear connecting the motor with the shaft-sections; ground-wheels connected with and driven by said sections; and brake or holding devices, one for each of said wheels, each adapted to hold its wheel against rotation or to retard such rotation.

3. In combination with a vehicle, comprising a body, having rear wheels to rest normally upon the ground, and a front swiveled truck provided with a divided driving-shaft; a motor for rotating said shaft; ground-wheels connected with and rotated by the respective sections of said shaft; and means substantially such as described for holding against rotation either ground-wheel while permitting the other to rotate under the power of the motor.

4. In combination with the body of a vehicle provided with rear wheels to rest normally on the ground and support the vehicle, a turn-table mounted in and adapted to turn relatively to the vehicle-body; a divided shaft carried by said turn-table; a motor for rotating said shaft; ground-wheels connected with and adapted to be rotated by the respective sections of said shaft; brakes or holding devices serving to hold against rotation the driven ground-wheels; clamping or holding devices adapted to hold the turn-table against rotation; and intermediate connections substantially such as described, between the locking or holding devices of the turn-table and the brakes or clamping devices of the wheels, whereby when the turn-table is locked or clamped, the brakes are released, and when either brake is applied the turn-table is released.

5. In combination with a divided driving-shaft, and ground-wheels of a motor-vehicle connected with and rotated by the respective sections of said shaft, brakes or holding devices, one for each of said wheels; a motor for rotating the shaft; differential gear interposed between the motor and said shaft; an operating-lever for the brakes or holding devices; and connections between said lever and brakes or holding devices, whereby when the lever is in its medial position both brakes are made free, and whereby, when the lever is thrown in direction to apply either brake, it is precluded from also applying the other brake.

6. In combination with the body A of a vehicle, an annular support E carried thereby, a turn-table D rotatably mounted in said annular support; an axle carried by the turn-table; ground-wheels mounted upon said axle; braking or clamping shoes q carried by the turn-table and adapted to press against the support E; a lever; connections between said lever and the shoes q, whereby the latter may be forced into or withdrawn from frictional contact with the support E; a motor; and connections between the motor and the ground-wheels whereby either or both of said wheels may be positively driven by the motor.

7. In a vehicle, the combination with the body, of the turn-table D and its supporting-ring E; outwardly-movable rods o, provided with shoes q to bear against the support E; a cross-head V pivotally attached to the turn-table D; rods n connecting said cross-head with the rods o; a crank-shaft T provided with a steering handle or lever; and rods m connecting the cranked portion of said shaft with the cross-head V.

8. In combination with the body of a vehicle, a ring or annular support E carried thereby; a turn-table D rotatable in said support; a divided shaft carried by said turn-table; ground-wheels supporting said turn-table; connections between said ground-wheels and the respective shaft-sections, whereby the wheels are driven; a motor; differential gear connecting the motor with the shaft-sections; brakes or holding devices serving to hold or retard the respective ground-wheels independently; a cross-head pivotally attached to the turn-table; brake-shoes carried by the turn-table and movable into and out of contact with its annular support; connections between the cross-head and the brake-shoes; a crank-shaft provided with a cranked portion; and a connection between said cranked portion of the shaft and the cross-head pivoted to the turn-table and also between said shaft and the brake-shoes or holding devices, adapted to permit either brake to be thrown into clamping action without affecting the other brake, substantially as set forth.

9. In combination with a vehicle, front and rear ground-wheels therefor; a motor connected with and serving to positively and independently rotate the front wheels; and brakes or holding devices adapted and arranged to brake or hold either front wheel at will, whereby the other is adapted to circle about the retarded wheel by reason of the power applied to the driven wheel, and thus to turn the vehicle or change the direction of its movement.

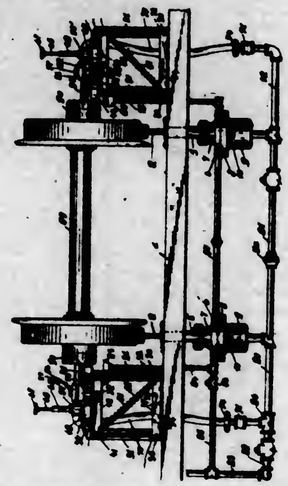
10. In combination with a vehicle, front and rear ground-wheels therefor; a turn-table interposed between the front wheels and the vehicle-body; a motor serving to positively and independently rotate said front wheels; brakes or holding devices adapted and arranged to brake or hold either driven wheel at will; and means for locking the turn-table against turning relatively to the vehicle-body.

11. In a vehicle, the combination with a body and rear supporting-wheels, of a forward truck swiveled in or rotatable relatively to said body and provided with ground-wheels; a motor serving to positively and independently rotate the wheels of said truck; and brakes or holding devices adapted and arranged to brake or hold either of said ground-wheels at will, and permit the other to circle about it under the power of the motor.

818,214. LUBRICATOR FOR CARS. JOSEPH F. JOY, Monongahela, Pa., assignor to Joy Horn Manufacturing Company, Monongahela, Pa., a Corporation of Pennsylvania. Filed Apr. 17, 1905. Serial No. 255,982.

Claim.—1. In an apparatus of the class described, the combination with a supporting-track, and a supply-pipe, of pumps communicating with said supply-pipe, resilient frames mounted on the track at the outside of the rails thereof, nozzle-supporting members slid-

ably mounted upon said frames, nozzles carried by said members and connected to said pumps, means to simultaneously actuate said pumps, and said movable nozzle-supporting members, and means to return said nozzle-supporting members to their normal position, substantially as described.



2. In an apparatus of the class described, the combination with a supporting-track, of resilient frames mounted at opposite sides of the track, nozzle-supporting members slidably mounted on said frames, nozzles carried by said members, the pumping-cylinders connected to said nozzles, means to simultaneously actuate said pumping-cylinders and said nozzle-supporting members, means for moving said resilient frames out of engagement with the actuating means, and means to return the pump-actuating means and the nozzle-supporting members to their normal position.

3. In an apparatus of the class described, the combination with a supply-pipe, a trackway and rolling-stock, of pump-cylinders connected to said supply-pipe and actuated by said rolling-stock, resilient frames mounted upon each side of said trackway, nozzles slidably mounted upon said side frames and connected to said pumping-cylinders, means actuated by said rolling-stock to force the contents of said pumping-cylinders through said nozzles, catch-basins mounted beneath said nozzles and connected to said reservoir, means actuated by said rolling-stock to return said nozzles to their normal position, substantially as described.

4. In an apparatus of the class described, the combination with a trackway, a supply-pipe and oil-cups, of rolling-stock, resilient frames mounted upon each side of said trackway, nozzles slidably mounted upon said frames and adapted to move with said rolling-stock, pumping-cylinders connected to said supply-pipe and said nozzles, means actuated by said rolling-stock to inject the contents of said pumping-cylinders through said nozzles into said oil-cups while the rolling-stock is in motion, and means to return said nozzles to their normal position, substantially as described.

5. In a lubricating apparatus of the class described, the combination with movable oil-cups or housings and a lubricant-supply pipe, of resilient frames mounted adjacent to said movable cups, movable nozzles mounted upon said frames, pumping-cylinders connected to said nozzles and said supply-pipe, means to simultaneously move said nozzles into engagement with said oil-cups and to actuate said pumping-cylinders to inject said lubricant into said cups, check-valves controlling the movement of said lubricant, adjustable pressure-valves controlling the movement of said lubricant, means to move said nozzles out of engagement with said cups, and means to return said nozzles to their normal position, substantially as described.

6. In an apparatus of the class described, the combination with a lubricant-supply pipe and movable oil-cups, of movable nozzles mounted in close proximity to said movable cups and adapted to engage said cups at predetermined times during the movement of said oil-cups, and means to inject the lubricant from the supply-pipe into said movable oil-cups, substantially as described.

7. In an apparatus of the class described, the combination with movable oil-cups or housings and a lubricant-supply, of frames mounted adjacent to said movable cups, nozzles slidably mounted upon said frames and communicating with said lubricant-supply, means to retain said nozzles in engagement with said movable cups, means to release said nozzles, and means actuated by the movement of said cups to inject lubricant from the supply through said nozzles into said cups, substantially as described.

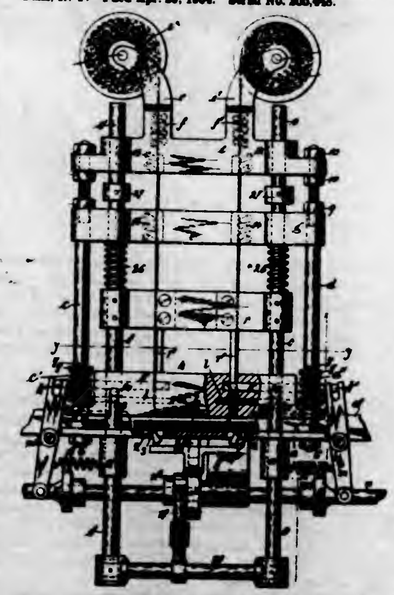
8. In an apparatus of the class described, the combination with a lubricant-supply and movable oil-cups or housings, of resilient frames, nozzles slidably mounted upon said frames and communicating with said lubricant-supply, means to retain said nozzles in engagement with said oil-cups, means actuated by said movable oil-cups to inject a portion of the contents of said lubricant-supply through said nozzle into said oil-cups, means to regulate the last-named means, means to release said nozzles from engagement with said oil-cups, and means to return the overdischarge of said nozzles to said reservoir, substantially as described.

9. In a lubricating apparatus of the class described, the combination with movable oil-cups or housings, of nozzles, means to move said nozzles a predetermined distance with said cups, means to inject a lubricant through said nozzles into said cups during the movement of said nozzles, and means to disengage said nozzles from said cups, substantially as described.

10. In a lubricating apparatus, the combination with movable oil-cups or housings, of nozzles, means to move said nozzles a predetermined distance in unison with said movable cups, and means to inject a lubricant through said nozzles into said cups, substantially as described.

11. In a lubricating apparatus, the combination with a supporting-track, of frames mounted outside the rails of the track, nozzle-supporting members slidably mounted on said frames, nozzles carried by said members, pumping-cylinders connected to said nozzles, pistons in said cylinders actuated by a car moving on said rails, means for actuating said nozzle-supporting members, and means to return the pistons and nozzle-supporting members to their normal positions.

813,215. STAPLING-MACHINE. CHARLES A. JUENGST, Croton Falls, N. Y. Filed Apr. 20, 1904. Serial No. 205,648.



Claim.—1. In a stapling-machine, the combination with a platform upon which the signatures or sheets to be connected rest, of means for progressively feeding the wire, a presser-bar adapted to come down on the signatures or sheets to hold the same in position, means for cutting the wire to form a staple and for simultaneously bending one end thereof, means for forcing the staple-wire through the signatures or sheets, and means for bending the wire on the under side of the signatures or sheets to complete the staple and hold the signatures or sheets together.

2. In a stapling-machine, the combination with a platform upon which the signatures or sheets to be connected rest, of means for progressively feeding the wire, a presser-bar adapted to come down on the signatures or sheets to hold the same in position, die-blocks and means for pivoting the same to the presser-bar, means for cutting the wire against the die-blocks to form a staple, and for simultaneously bending one end thereof, means for holding the die-blocks while the wire is cut, means for forcing the staple-wire through the signatures or sheets, and means for bending the wire on the under side of the signatures or sheets to complete the staple and hold the signatures or sheets together.

3. In a stapling-machine, the combination with a platform upon which the signatures or sheets to be connected rest, and means for progressively feeding the wire, of a presser-bar adapted to rest upon the pile of signatures or sheets and having vertical grooves for the wires, cutter-bars horizontally movable through apertures in said presser-bar, and means for actuating the same for cutting off lengths of the wire and simultaneously bending over adjacent ends equal in length to the width of the cutter-bars.

4. In a stapling-machine the combination with a platform upon which the signatures or sheets to be connected rest and means for progressively feeding the wire, of a presser-bar adapted to rest upon the pile of signatures or sheets and having vertical grooves for the wires, cutter-bars horizontally movable through apertures in said presser-bar, means for actuating the same for cutting off lengths of the wire and simultaneously bending over adjacent ends equal in length to the width of the cutter-bars, pivoted yielding die-blocks with parts normally below the cutter-bars and against which similar ends of staples are turned over, locking-bars for holding the yielding die-blocks while the cutting and bending acts are performed, the aforesaid means for actuating the cutter-bars also serving for the simultaneous movement with the cutter-bars of the locking-bars.

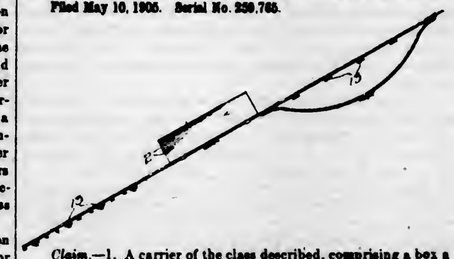
5. In a stapling-machine, the combination with a platform upon which the signatures or sheets to be connected rest, and means for progressively feeding the wire, of a presser-bar adapted to come down on the signatures or sheets to hold the same in position, said presser-bar having vertical apertures for the wire and adjacent larger vertical apertures, said presser-bar also having longitudinal apertures in pairs from opposite ends and slotted transversely in part, a cross-head, plungers connected to the cross-head and adapted to enter the larger vertical apertures parallel with the wires which enter the smaller vertical apertures, cutter-bars and locking-bars in pairs adapted to enter the horizontal apertures from opposite ends, and die-blocks pivotally connected to the presser-bar and adapted to pass through the transverse apertures.

6. In a stapling-machine, the combination with a platform upon which the signatures or sheets to be connected rest and means for progressively feeding the wire, of a presser-bar adapted to come down on the signatures or sheets to hold the same in position, said presser-bar having vertical apertures for the wire and adjacent larger vertical apertures, said presser-bar also having longitudinal apertures in pairs from opposite ends and slotted transversely in part, a cross-head, plungers connected to the cross-head and adapted to enter the larger vertical apertures parallel with the wires which enter the smaller vertical apertures, cutter-bars and locking-bars in pairs adapted to enter the horizontal apertures from opposite ends, die-blocks pivotally connected to the presser-bar and adapted to pass through the transverse apertures, means for actuating the cross-head and plunger, means for simultaneously actuating the pairs of cutter-bars and locking-bars, the locking-bars momentarily holding the die-blocks in position while the cutter-bars cut the wire and bend similar ends of the same over the upper surface of the die-blocks.

7. In a stapling-machine, the combination with a platform upon which the signatures or sheets to be connected rest and means for progressively feeding the wire, of a presser-bar adapted to come down on the signatures or sheets to hold the same in position, said presser-bar having vertical apertures for the wire and adjacent larger vertical apertures, said presser-bar also having longitudinal apertures in pairs from opposite ends and slotted transversely in part, a cross-head, plungers connected to the cross-head and adapted to enter the larger vertical apertures parallel with the wires which enter the smaller vertical apertures, cutter-bars and locking-bars in pairs adapted to enter the horizontal apertures from opposite ends, die-blocks pivotally connected to the presser-bar and adapted to pass through the transverse apertures, means for actuating the cross-head and plunger, means for simultaneously actuating the pairs of cutter-bars and locking-bars the locking-bars momentarily holding the die-blocks in position while the cutter-bars cut the wire and bend similar ends of the same over the upper surfaces of the die-blocks, dogs pivoted in apertures in the platform beneath the pile of signatures or sheets, and means for raising the same for completing the form of staples for connecting the signatures or sheets.

8. In a stapling-machine, the combination with a platform upon which the signatures or sheets to be connected rest and means for progressively feeding the wire, of a presser-bar adapted to come down on the signatures or sheets to hold the same in position, said presser-bar having vertical apertures for the wire and adjacent larger vertical apertures, said presser-bar also having longitudinal apertures in pairs from opposite ends and slotted transversely in part, a cross-head, plungers connected to the cross-head and adapted to enter the larger vertical apertures parallel with the wires which enter the smaller vertical apertures, cutter-bars and locking-bars in pairs adapted to enter the horizontal apertures from opposite ends, die-blocks pivotally connected to the presser-bar and adapted to pass through the transverse apertures, means for actuating the cross-head and plunger, dogs pivoted in apertures in the platform beneath the pile of signatures or sheets, means for raising the same for completing the form of staples for connecting the signatures or sheets, a power-shaft, cams on the power-shaft, rock-shafts actuated by the cams for simultaneously moving the pairs of cutter-bars and locking-bars, the locking-bars momentarily holding the die-blocks in position while the cutter-bars cut the wire and bend similar ends of the same over the upper surfaces of the die-blocks, a crank device on the rock-shaft, devices connected to the crank device for effecting the movement of the wire-feed devices and the cross-head and plungers and permitting the presser-bar to come down upon the signatures or sheets, and a device actuated by the cam device for moving the aforesaid dogs to complete the bend of the staples.

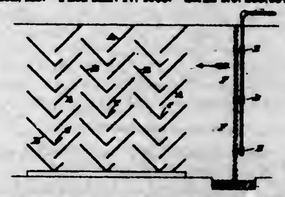
813,216. BOOK-STRAP. MABEL H. KARIBO, San Luis Obispo, Cal. Filed May 10, 1905. Serial No. 259,765.



Claim.—1. A carrier of the class described, comprising a box a series of main straps arranged in alinement and slidably engaged with the bottom of the box, one end of each said straps having a series of buttons and the other end having a loop for engagement interchangeably with said buttons, cross-straps connecting said series of straps, shoulder-straps connected with the outermost main straps upon one side of the box, and another strap detachably associated with the last-named straps.

2. A carrier of the class described, a holder, straps slidably associated therewith, one end of each strap having a series of buttons and the opposite end thereof having a loop, cross-straps engaging the first straps, shoulder-straps engaged with the outermost of said first straps upon one side of the holder, and another strap engaging the shoulder-straps.

813,217. AIR-PURIFYING APPARATUS. JOHN H. KENEALY, Pergamo, Mo. Filed Mar. 17, 1905. Serial No. 250,054.



Claim.—1. In an air-purifying apparatus, an air-washer, and a water-eliminator consisting of deflecting-plates for alternately deflecting the air downward and upward, said deflecting-plates being

slightly inclined to the horizontal in the direction of their length, and the plates for deflecting the air upward being provided at their lower

tongue of relatively large extent formed upwardly from the sub-

slightly inclined to the horizontal in the direction of their length, and the plates for deflecting the air upward being povided at their lower edges with gutters to carry away the water, substantially as described.

2. In an air-purifying apparatus, an air-washer consisting of a thoroughfare for the air and a transverse wall of vertically-dropping water in a sprayed or finely-divided condition, and a water-eliminator consisting of deflecting-plates for alternately deflecting the air downward and upward, said deflecting-plates being slightly inclined to the horizontal in the direction of their length, and the plates for deflecting the air upward being provided with gutters at their lower edges to carry away the water, substantially as described.

3. In an air-purifying apparatus, an air-washer, and a water-eliminator consisting of deflecting-plates for alternately deflecting the air downward and upward, said deflecting-plates being slightly inclined to the horizontal in the direction of their length, and the plates for deflecting the air upward being corrugated in the direction of their length and provided at their lower edges with gutters to carry away the water, substantially as described.

4. In an air-purifying apparatus, an air-washer consisting of a thoroughfare for the air and a transverse wall of downward-falling water in a sprayed or finely-divided condition, and a water-eliminator consisting of deflecting-plates for alternately deflecting the air downward and upward, said deflecting-plates being slightly inclined to the horizontal in the direction of their length, and the plates for deflecting the air upward being corrugated in the direction of their length and provided at their lower edges with gutters to carry away the water, substantially as described.

5. In an air-purifying apparatus, an air-washer consisting of a thoroughfare for the air and a transverse wall of downward-falling water in a sprayed or finely-divided condition, and a water-eliminator consisting of deflecting-plates for alternately deflecting the air downward and upward, said deflecting-plates being slightly inclined to the horizontal in the direction of their length, the plates for deflecting the air upward being corrugated in the direction of their length and provided at their lower edges with gutters to carry away the water, and means for carrying from the eliminator the water flowing from the gutters of said upward-deflecting plates, substantially as described.

6. In an air-purifying apparatus, a thoroughfare for the air, a spray-box arranged transversely to the thoroughfare at the top thereof, a pipe for supplying water to the spray-box, deflecting-plates for alternately deflecting the air downward and upward, said deflecting-plates being slightly inclined to the horizontal in the direction of their length, the plates for deflecting the air upward being corrugated in the direction of their length and provided at their lower edges with gutters to carry away the water, and means for carrying from the eliminator the water flowing from the gutters of said upward-deflecting plates, substantially as described.

7. In an air-purifying apparatus, a thoroughfare for the air, a spray-box arranged transversely to the thoroughfare at the top thereof, a pipe for supplying water to said spray-box, deflecting-plates for alternately deflecting the air downward and upward, said deflecting-plates being slightly inclined to the horizontal in the direction of their length, the plates for deflecting the air upward being provided at their lower edges with gutters to carry away the water, and means for carrying from the eliminator the water flowing from the gutters of said upward-deflecting plates, substantially as described.

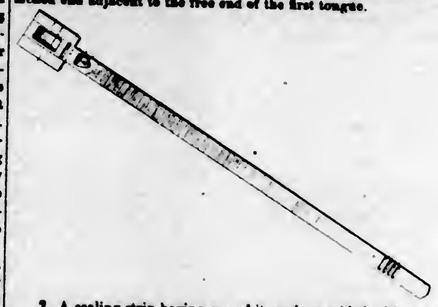
813,218. PROCESS FOR RENDERING MATERIALS OR ARTICLES RESISTANT TO WATER AND CHEMICALS. CARL KOCHMANN and JULIUS KAUFMANN, Berlin, Germany. Filed Sept. 7, 1905. Serial No. 277,472.

Claim.—1. The process of rendering materials or articles resistant to water and chemicals, which consists in treating the materials or articles with a solution of alum, and melted carnauba-wax.

2. The process of rendering materials or articles resistant to water and chemicals, which consists in first saturating the material or article with a solution of alum, and then subsequently treating same with melted carnauba-wax; substantially as set forth.

813,219. SELF-LOCKING SEAL. FRANK LAPORTE, St. Louis, Mo. Filed May 18, 1905. Serial No. 260,973.

Claim.—1. A sealing-strip having one of its ends provided with a plurality of transverse slots and the other end laterally extended and provided with a single transverse slot adjacent to the junction of the strip with its laterally-extended end, a projecting embossed surface beyond the single slot and between the lateral extensions, a tongue of relatively large extent formed upwardly from the substance of the strip, and having its attached end adjacent to the single transverse slot, and a tongue of relatively small extent formed downwardly from the substance of the first tongue, and having its attached end adjacent to the free end of the first tongue.

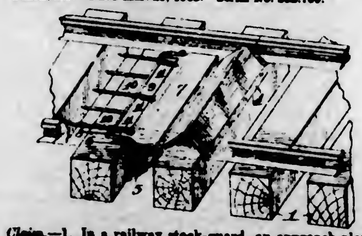


2. A sealing-strip having one of its ends provided with a plurality of transverse slots, and the other end provided with a single transverse slot, a tongue of relatively large extent formed upwardly from the substance of the strip and having its attached end adjacent to the single transverse slot, a tongue of relatively small extent formed downwardly from the substance of the first tongue and having its attached end adjacent to the free end of the first tongue, and means on one of the ends of the strip for inclosing the overlapping ends.

3. A sealing-strip, having one of its ends provided with a plurality of transverse slots and the other end provided with a single transverse slot, a tongue of relatively large extent formed from the substance of the strip and engaging one of the slots to prevent longitudinal movement of the ends of the strip from each other in one direction, a tongue formed from the substance of the strip for preventing longitudinal movement of the ends of the strip upon each other in the opposite direction, and means connected with one of the ends of the strip for inclosing the overlapping ends.

4. A sealing-strip, provided at one end with a plurality of transverse slots, a tongue at the other end of the strip engaging one of the slots to prevent movement of the ends of the strip upon each other in one direction, means on the tongue for engaging an adjacent slot to prevent movement of the ends of the strip upon each other in the opposite direction, and means connected with the strip for retaining the ends in contact with each other.

813,220. RAILWAY STOCK-GUARD. LOUIS LEBMANN, Dixon, Mo., assignor of one-fifth to Fred Welsh and one-fifth to W. F. Carter, Dixon, Mo. Filed Mar. 20, 1905. Serial No. 250,709.



Claim.—1. In a railway stock-guard, an approach-plate, having two inclined faces, a downwardly-curved plate integral with one of the edges of the approach-plate, and a guard pivotally mounted at a point above the curved plate; substantially as specified.

2. In a railway stock-guard, an approach-plate having two inclined faces, a plate hinged at one edge and overhanging one side of the approach-plate, and a guard mounted to swing on one edge of the pivoted plate; substantially as specified.

3. In a railway stock-guard, an approach-plate having two inclined faces, a curved plate integral with one edge of the approach-plate, a plate hinged at one edge above the lower end of the curved plate, and a yielding guard pivotally secured to one edge of the hinged plate; substantially as specified.

4. In a railway stock-guard, an approach-plate having two inclined faces, a plate hinged at one edge and overhanging one side of the approach-plate, a rod pivotally secured to one side of the hinged plate, rods projecting laterally from the pivotally-mounted rod, and retractile coil-springs arranged between the pivoted rod and the edge of the hinged plate; substantially as specified.

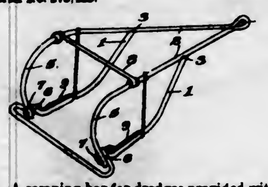
813,221. CATAMENIAL SACK. WALLACE M. LONGSTRETH, Tuts Alta, W. Va. Filed Apr. 5, 1905. Serial No. 253,263.

Claim.—1. A catamenial sack comprising a receptacle for absorbent material formed from a single length of wire bent to form two parallel side bars, two parallel bottom bars, and a catch at the junction of said side bars with said bottom bars, a retainer for said absorbent material formed of a U-shaped length of wire pivoted at the ends of its arms to the side bars of the said receptacle and having its cross-bar adapted to engage with the above-mentioned catch, and means to attach said receptacle to the person.

2. A catamenial sack comprising an elongated curved receptacle for absorbent material, the same comprising parallel longitudinal side bars and bottom bars, means to hold said bars in their parallel relation, a catch at one end of said receptacle and a bail hinged to the other end thereof and adapted to engage said catch to secure said material in the receptacle.

3. In a catamenial sack, an elongated curved, open-work receptacle formed from a single length of wire bent to form the parallel side bars, the bottom bars connected together at their rear ends by an integral cross-bar and connected at their front ends to the front ends of the side bars by integral cross-pieces having catch-forming bends, and a U-shaped retainer pivoted at its rear ends to the side bars and at its front closed and adapted to snap under said catch.

813,222. DREDGE. JAMES F. LOREMAN, Crisfield, Md. Filed Aug. 9, 1905. Serial No. 273,433.



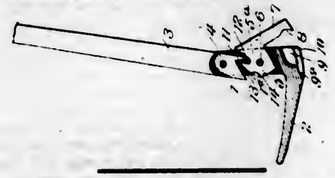
Claim.—1. A scraping-bar for dredges provided with an extension which projects beyond the side of the dredge and tends to prevent same from turning over.

2. A scraping-bar for dredges provided with extensions which project beyond the sides of the dredge and are formed by bending the ends of the scraping-bar back upon themselves before securing same to the framework, said extensions tending to prevent the dredge from turning upon its side.

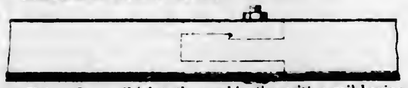
3. A scraping-bar for dredges formed with extensions which project beyond the sides of the dredge and are formed by bending the ends of the bar back upon themselves and then turning the extremities up for engagement with the frame, said extensions tending to prevent the dredge from turning upon its side.

813,223. SPIKE-PULLER. JAMES F. LOREMAN, Crisfield, Md. Filed Aug. 9, 1905. Serial No. 273,434.

Claim.—A spike-puller comprising the stock 1 embodying the spaced sides 1°, the laterally-extending feet 2 integrally formed with the stock at the lower extremities of the sides 1° aforesaid, the side of the stock opposite that from which the feet 2 projects, being provided at the lower end thereof with a head-receiving socket 9 contracted at its lower portion as shown at 9°, the lever 3 pivoted at 4 between the sides 1° of the stock, the jaw member 5 comprising the body 5° pivoted at 6 between the sides 1° of the stock and arranged below the lower end of the lever 3, the jaw 7 projecting downwardly from the jaw member 5 and provided with a recess 8 on its inner side, the toe extension 11 formed at the lower extremity of the lever 3, the body 5° on the member 5 having the recess 12 to receive the toe extension 11, the said body 5° being also formed with a cam-surface 14 at its inner side, and a cam extension 13 projecting downwardly from the lower extremity of the lever 3 and adapted to engage the cam-surface 14 on the member 5, as specified.

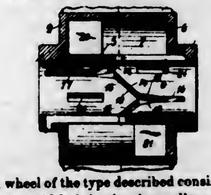


813,224. RAIL-JOINT. THOMAS W. MAYO, Redding, Cal. Filed Nov. 28, 1905. Serial No. 289,496.



Claim.—In a rail-joint, the combination with a rail having its web thickened to the width of the tread and having its lower face recessed and having a vertical slot formed therethrough and opening through its extremity, said slot at its inner end being broadened in one direction and having its outer vertical wall 14 cut under, of a second rail having its end portion reduced transversely to engage the slot of the first-named rail, the free end portion of the reduced end of the second rail being broadened in one direction and having the inner vertical wall of the broadened portion cut under to correspond to and fit against the cut-under wall 8 of the broadened portion of the slot of the first-named rail, the second rail having the end portion of its flange reduced vertically and fit in the cut-away portion of the bottom of the first-named rail.

813,225. WHEEL. CHARLES P. MELVIN, Monongahela, Pa. Filed May 13, 1905. Serial No. 260,234.



Claim.—1. A wheel of the type described consisting of a flanged rim, spokes and hub, said hub having inwardly-extending annular shells, there being an annular compartment formed by said shells, the confronting edges of said shells providing a sinuous passage, said shells having slots formed therein intercepting said passage, there being a plurality of radially-disposed ribs staggeredly arranged within said compartment, said hub having openings formed therein communicating with said slots, substantially as described.

2. In a wheel of the type described, the combination with a flanged rim and spokes, of a hub supported by said spokes, said hub having an annular compartment formed therein, said compartment having a plurality of radially-disposed ribs staggeredly arranged therein, said hub having openings formed therein communicating with said compartment, said hub having a sinuous passage-way formed therein, substantially as described.

3. The combination with an axle, of a wheel having a hub, said hub having a central bore formed therein, said hub having a compartment formed therein surrounding said bore, said compartment having a plurality of radially-disposed ribs formed therein extending each part way of the length of the compartment and alternately from opposite ends thereof, means to convey the contents of said compartment to said bore, and means whereby access may be had to said compartment, substantially as described.

4. In a wheel of the character described, the combination with a hub having a central bore, of a compartment surrounding said bore, the inner wall of said compartment providing inwardly-extending shells, the confronting edges of said shell providing a sinuous passage-way, said shells having slots formed therein communi-

a roof formed by upper and lower layers with intervening air-passages communicating with the atmosphere, air-ports leading downwardly from said roof-passages to a hot-air flue, a series of heated-air flues leading upwardly to a combustion-chamber, and a series of intervening gas-ports also leading upwardly to said combustion-chamber

back support movably secured to the arch on either side of the loop on the arch, and provided with an upward extension for engaging the loop on the arch, to limit the angular opening of the arch-support.

link members with the exterior link members, said members detachably connected one to another, and retaining-pins journaled within said interior link members, said retaining-pins being formed with

4. In a wheel of the character described, the combination with a hub having a central bore, of a compartment surrounding said bore, the inner wall of said compartment providing inwardly-extending shells, the confronting edges of said shell providing a sinuous passage-way, said shells having slots formed therein communicating with said passage, substantially as described.

5. In a wheel, the combination with a hub having a central bore formed therein, of a compartment surrounding said bore, the inner wall of said compartment providing confronting shells having slots formed therein affording communication between said compartment and the said bore, means whereby access may be had to said compartment, substantially as described.

6. In a wheel, the combination with a hub, of confronting shells carried by said hub, and forming a central bore, and a compartment surrounding the bore, said shells having a plurality of slots formed therein communicating with one another and extending through the shells, means whereby access may be had to said compartment.

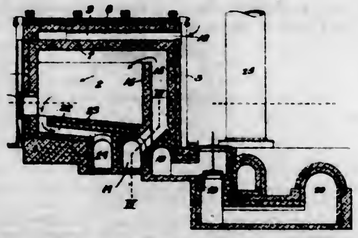
7. In a wheel, the combination with a hub, of confronting shells carried by said hub, said shells having a plurality of slots formed therein communicating with one another, said hub having an annular compartment formed therein adapted to contain a lubricant and communicating with the bore of the hub through said slots, and means to elevate said lubricant within said compartment.

8. In a wheel, the combination with a hub having a central bore, of an annular compartment surrounding said bore, the sides of said bore having a sinuous slot formed therein communicating with said compartment, means to agitate the contents of said compartment.

9. In a wheel, the combination of a hub, said hub being formed of confronting shells providing a circuitous sinuous passage-way, the wall of said bore having slots formed therein communicating with said passage-way, a compartment communicating with said slots and said passage-way, means whereby access may be had to said compartment from the exterior of said hub, substantially as described.

10. In a wheel, the combination of a hub having a central bore, there being a lubricant-compartment surrounding said bore, the walls of said bore having a circuitous passage-way formed therein, adapted to convey the contents of said compartment to said bore, substantially as described.

813,226. FURNACE. JAMES C. MILLER, Pittsburg, Pa., assignor to Porter Miller Engineering Company, Pittsburg, Pa., a Corporation of Pennsylvania. Filed Mar. 7, 1905. Serial No. 248,896.



Claim.—1. A furnace provided with a bridge-wall, a series of air-ports traversing the roof and walls of the furnace and finally leading upwardly terminating below the top of the bridge-wall, a series of gas-ports traversing the walls of the furnace structure also leading upwardly and terminating below the top of the bridge-wall, whereby the heated air and gas are caused to commingle and flow in the same direction, with an outlet-flue for the products of combustion opening into the furnace-chamber at the opposite lower portion thereof, whereby the gases circulate diagonally across the furnace area, substantially as set forth.

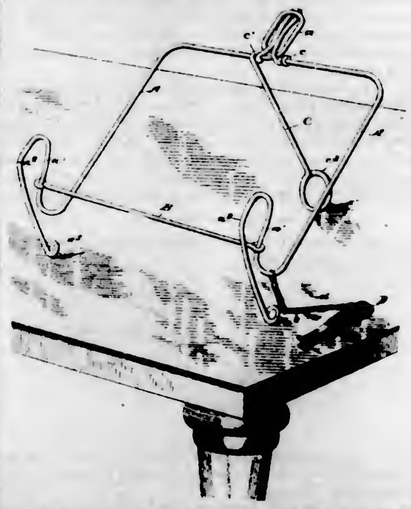
2. A furnace provided with a bridge-wall, a series of air-ports traversing the roof and walls of the furnace and finally leading upwardly terminating below the top of the bridge-wall, a series of gas-ports traversing the walls of the furnace structure also leading upwardly and terminating below the top of the bridge-wall, whereby the heated air and gas are caused to commingle and flow in the same direction, an outlet-flue for the products of combustion opening into the furnace-chamber at the opposite lower portion thereof, and a series of return-ports communicating with said opening leading underneath the furnace-floor and communicating with an outlet-conveyor for the waste products, substantially as set forth.

3. In a heating-furnace, the combination of inclosing walls and a roof formed by upper and lower layers with intervening air-passages communicating with the atmosphere, air-ports leading downwardly from said roof-passages to a hot-air flue, a series of heated-air flues leading upwardly to a combustion-chamber, and a series of intervening gas-ports also leading upwardly to said combustion-chamber, with a series of outlet-ports communicating with an escape-flue and opening into the furnace-chamber at the opposite lower portion thereof, substantially as set forth.

4. In a heating-furnace, the combination of inclosing walls and a roof formed by upper and lower layers with intervening air-passages communicating with the atmosphere, air-ports leading downwardly from said roof-passages to a hot-air flue, a series of heated-air flues leading upwardly to a combustion-chamber, and a series of intervening gas-ports also leading upwardly to said combustion-chamber, with a series of outlet-ports communicating with an escape-flue and opening into the furnace-chamber at the opposite lower portion thereof, and an intervening bridge-wall extending upwardly beyond the combustion-chamber, substantially as set forth.

5. In a heating-furnace, the combination with a chamber inclosed within the walls of the furnace structure having a roof provided with upper and lower portions, of return-air passages incorporated between the upper and lower portions of the roof structure communicating with the atmosphere, with communicating downwardly and upwardly leading air-ports, and a series of gas-supply ports, terminating in a common combustion-chamber; with a series of return-ports leading underneath the furnace-floor and opening into the furnace-chamber at its lower portion opposite the combustion-chamber, whereby the products of combustion are caused to traverse the furnace-chamber, substantially as set forth.

813,227. BOOK-HOLDER. JAMES H. MILLER, Ashland, Oreg. Filed May 27, 1905. Serial No. 262,626.



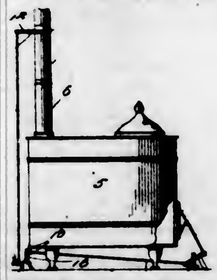
Claim.—1. A book-holder comprising a flexible strand bent to form an arched back support having a loop at the top of the arch, the ends of the flexible strand bent upwardly to form edge supports, and downwardly upon themselves to a point beneath the edge supports, and turned into rings for supporting the holder, a cross flexible strand connecting the loops formed by the junction of the edge supports and the holder-supports, a movable rear holder-support, comprising a third flexible strand lapping the flexible strand of the arch on either side of the inner end of the loop, and having a portion intermediate the laps bent up to form a loop for engaging the loop on the arch to limit the movement of the holder-support with respect to the holder, a chain connected to one end of the edge supports and a spring book-leaf clamp attached to the chain.

2. A book-holder comprising a flexible strand bent to form an arched back support having a loop at the top of the arch, the ends of the flexible strand bent upwardly to form edge supports, and downwardly to a point beneath the edge supports to form front holder-supports, a cross flexible strand connecting the edge supports, and a back support movably secured to the arch on either side of the loop on the arch, and provided with an upward extension for engaging the loop on the arch, to limit the angular opening of the arch-support.

3. A book-holder comprising a flexible strand bent to form an arched back support having a loop at the top of the arch, the ends of the flexible strand bent upwardly to form edge supports, and downwardly to a point beneath the edge supports to form front holder-supports, means connecting the edge supports, a back support movably connected to the arch on each side of the loop, and means on the back support engaging the loop to limit the outward movement of the arch-support.

4. A book-holder comprising a flexible strand bent to form arched back supports having a loop at the top of the arch, the ends of the flexible strand bent upwardly to form edge supports, and downwardly to a point beneath the edge supports to form front holder-supports, means connecting the edge supports, means movably connected to the arch for supporting the rear of the holder, and means engaging the loop for limiting the outward movement of the said supporting means.

813,228. AUTOMATIC DAMPER. WILLIAM H. H. MORELOCK, Jonesboro, Ark. Filed Feb. 3, 1904. Serial No. 191,880.



Claim.—As an article of manufacture, an automatic damper-moving mechanism comprising a split collar adapted for engagement with the smoke-pipe of a stove, a clamping-bolt engaged in the collar, an ear carried by the collar, a rod engaged in the ear, a supporting-block, a lever pivoted in the supporting-block for movement in a vertical plane and having series of perforations therein at opposite sides of its pivot-point, said rod having an angular end arranged for interchangeable engagement in the perforations at one side of the pivot-point, a second supporting-block, a lever pivoted in the second supporting-block for movement in a vertical plane, said second lever having series of perforations therein at opposite sides of its pivot-point, a rod having angular ends, one engaged in one of the perforations at the opposite side of the pivot-point of the first-named lever from the first-named rod and being adapted for interchangeable engagement in these perforations, the other angular end of the second-named rod being engaged in one of the perforations of the second-named lever and being adapted for engagement in the several perforations of the same series interchangeably, the other series of perforations of the second lever being adapted to receive an attaching device for connection of said lever with the damper mechanism of a stove.

813,229. DETACHABLE-LINK CHAIN. ARCHIBALD D. MORRIS, New York, N. Y. Filed Nov. 19, 1904. Serial No. 233,436.

Claim.—1. In a detachable-link chain, the combination of the interior link members with the exterior link members, pins connecting said exterior and interior members, and rotatable retaining-pins formed with flanges overlapping the exterior link members, said flanges normally retaining the members in operative relation.

2. In a detachable-link chain the combination of the interior link members with the exterior link members, said members being detachably connected one to another, and retaining-pins journaled within said interior link members, said retaining-pins controlling the assembling and disassembling of the chain.

3. In a detachable-link chain the combination of the interior link members with the exterior link members, said members detachably connected one to another, and retaining-pins journaled within said interior link members, said retaining-pins being formed with flanges normally overlapping said exterior link members for holding the link members in proper operative relation.

4. In a detachable-link chain the combination of the interior link members with the exterior link members said members being detachably connected one to another, pins journaled centrally within said interior link members having disks rigidly connected thereto, and locking-dogs connected to said disks for preventing the disassembling of the link members.

5. In a detachable-link chain, the combination of the exterior link members with the interior link members, and means for detachably connecting said members together, said means comprising retaining-pins journaled centrally within the interior link members, said retaining-pins having overlapping ends having portions thereof cut away to conform to the periphery of the extremities of the exterior link members, said retaining-pins connecting the members and normally holding them in operative relation.

6. In a detachable-link chain, the combination of the exterior link members with the interior link members, said members being detachably connected one to another, retaining-pins journaled centrally within said interior link members, said pins having disks partially cut away and which normally overlap said exterior link members, and dogs detachably connected to said disks for preventing the disassembling of the link members.

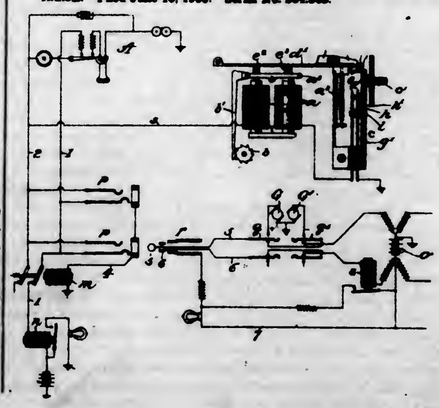
7. In a detachable-link chain the combination of the exterior link members with the interior link members, means for detachably connecting said exterior and interior link members, said means comprising spindles rotatably mounted within the extremities of the interior link members and being keyed in the exterior link members, and pins rotatably mounted centrally within the said interior link members, having disks partially cut away for connecting and normally holding the members in operative relation.

8. In a detachable-link chain, a plurality of link members, some of said link members being interjacent of the other of said link members, and retaining means comprising disks, connected to the interjacent members for connecting the members and for controlling the assembling and disassembling of the link members.

9. In a detachable-link chain, the combination of a plurality of link members, some of said link members being interjacent of the other of said link members, pins connected to said interjacent members, said pins having connected at their extremities disks partially cut away, said disks normally holding the members in operative relation and controlling the disassembling of the said link members.

10. In a detachable-link chain the combination of the exterior link members, interior link members having eyes or openings adjacent to their ends, pins engaging both members for connecting them, and adjustable retaining means comprising disks, connected to the interior link members for controlling the assembling and disassembling of the link members.

813,230. SERVICE-METER FOR TELEPHONE-EXCHANGES. FRANK R. MCBERTY, Evanston, and HOWARD B. CRAFT, Chicago, Ill., assignors to Western Electric Company, Chicago, Ill., a Corporation of Illinois. Filed June 10, 1905. Serial No. 264,966.



Claim.—1. The combination with an electromagnet, of a tilting armature therefor, a circuit for said magnet, a switch controlling said circuit, a catch adapted to lock said switch in its open position, a

9. In a service-meter, the combination with an electromagnet, of a tilting armature therefor, switch-springs controlling the circuit

---

813,233. COMBINED DAVENPORT AND BED. ARTHUR M. PARSONS, Lead, S. D. Filed July 26, 1905. Serial No. 271,294.

wedge member, and a spring housed in a corresponding part of the frame meeting with the follower to move the wedge to expand the

Claim.—1. The combination with an electromagnet, of a tilting armature therefor, a circuit for said magnet, a switch controlling said circuit, a catch adapted to lock said switch in its actuated position, a registering-train operated in the movement of the armature in one direction, said catch being operated in such movement of the armature to release the switch, the armature being adapted when moved in the opposite direction to operate said catch and release the switch without effecting a registration, and means for applying current in the circuit of said magnet to effect the movement of said armature in either direction.

2. In a service-meter, the combination with a tilting lever, of electromagnetic mechanism for moving said lever in either direction, a switch controlling the circuit connections of said mechanism, a catch adapted to lock said switch in its actuated position, and a registering-train operated in the movement of said lever in one direction, said lever being adapted in such movement to operate said catch to release the switch, said lever when moved in the opposite direction releasing said switch without effecting a registration.

3. In a service-meter, the combination with an electromagnet, of a centrally-pivoted armature therefor, switch-springs controlling the circuit connections of said magnet, a pivoted arm, a catch carried thereby adapted to lock said switch-springs in their actuated position, and a registering-train operated by said armature when moved in one direction, said armature when so moved operating said pivoted arm to withdraw the catch and release said switch-springs, said armature when moved in the opposite direction moving said arm to release the switch-springs without effecting a registration.

4. In a service-meter the combination with a polarized electromagnet, of a centrally-pivoted armature therefor, switch-springs controlling the circuit connections of said magnet, a pivoted arm carrying a hook at its outer end adapted to engage the ends of said springs when the same are operated to lock them in such position, studs upon said armature on either side of the pivot thereof, a spring normally holding said pivoted arm adjacent to said studs, a registering-train, a pawl carried by said armature adapted when said armature is tilted in one direction to operate said train, one of said studs in such movement of the armature moving said pivoted arm to withdraw the hook thereof and release said switch-springs, said armature when tilted in the opposite direction acting through the agency of the other stud to move said arm and release the switch-springs without affecting the registering-train.

5. In a service-meter, the combination with an electromagnet, of an armature therefor, a registering-train controlled by said armature in its movement, a switch controlling the circuit connections of said magnet, a catch, means for closing said switch and effecting the locking thereof by said catch, and means for preventing actuation of the switch after the same is closed and while locked, said armature being adapted when moved to operate said catch and release the switch.

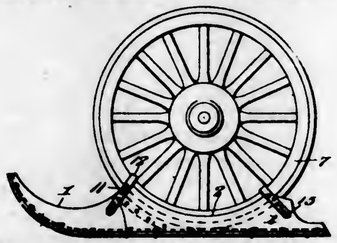
6. In a service-meter, the combination with an electromagnet, of an armature therefor, a registering-train controlled by said armature in its movement, a switch controlling the circuit connections of said magnet, a catch, a device for moving said switch until locked by said catch, said switch closing upon the withdrawal of said device, and a guard for preventing subsequent movement of said switch by said device while the switch is locked, said armature being adapted when moved to operate said catch and release the switch.

7. In a service-meter, the combination with an electromagnet, of a tilting armature therefor, a switch controlling the circuit connections of said magnet, a pivoted arm, a catch carried thereby, a device for moving said switch until locked by said catch, said switch closing upon the withdrawal of said device, a guard for preventing subsequent actuation of the switch by said device while the same is locked, and a registering-train operated by said armature when moved in one direction, the armature when so moved operating the pivoted arm to release said switch, the armature when moved in the opposite direction moving said arm to release the switch without effecting a registration.

8. In a service-meter, the combination with an electromagnet, of an armature therefor, a registering-train controlled by said armature in its movement, switch-springs controlling the circuit connections of said magnet, a tension member adapted when operated to move said springs, a catch adapted to hold said member in such position, a device for operating said tension member, an insulating-spacer adapted to be engaged by said device to hold said springs apart as the same are moved by said tension member, said spacer upon the withdrawal of said device moving to permit the springs to close, and means for preventing subsequent actuation of said springs by said device while the switch is locked, said armature being adapted when moved to operate said catch and release the switch-springs.

9. In a service-meter, the combination with an electromagnet, of a tilting armature therefor, switch-springs controlling the circuit connections of said magnet, an idler-spring carrying an insulating-button adapted upon the operation of said spring to move said switch-springs, a pivoted arm, a catch carried thereby adapted to lock said idler-spring in its operated position, a device for moving said spring, an insulating-spacer engaged by said device when moved adapted to maintain said switch-springs apart, said spacer upon the withdrawal of the device moving to permit said switch-springs to close, a lip carried by said idler-spring, a spring-actuated stop-lever normally resting against said lip, said lever upon the movement of the idler-spring being interposed between said spring and the operating device to prevent subsequent actuation of the switch-springs by said device, and a registering-train operated by said armature when moved in one direction, said armature when so moved operating the said pivoted arm to release the switch-springs, said armature when tilted in the opposite direction moving said arm to release the catch without operating the registering-train, as described.

813,231. SNOW-SHOE FOR WHEELS. FRANK W. NIGHTINGALE, Quincy, Mass. Filed Apr. 23, 1905. Serial No. 256,941.

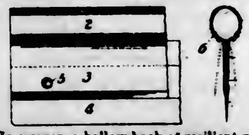


Claim.—1. A runner for use with wheeled vehicles comprising side plates bent inward at their lower edges to provide flanges to receive and support the wheel, a shoe secured to the lower side of said flanges, and a filler-block secured between the side plates.

2. A runner for use with vehicles comprising side plates bent inward at their lower edges to provide flanges with which the wheel is adapted to contact, a shoe secured to the lower surface of said flanges, a filler-block comprising a curved plate having depending side flanges, the flanges of said block being secured to the side plates of the runner.

3. In combination with the wheel of a vehicle, of a runner comprising side plates having inwardly-projecting flanges at their lower edges adapted to receive and support the wheel, a shoe secured to said flanges, and a filler-block secured between the side plates and being curved in longitudinal section to conform to the curvature of the wheel.

813,232. RAZOR. JOHN W. OFFUTT, Ellwood City, Pa., assignor of one-half to R. T. Brown, Ellwood City, Pa. Filed July 26, 1905. Serial No. 271,274.



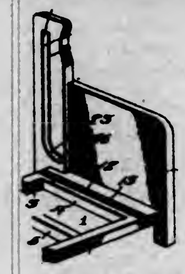
Claim.—1. In a razor, a hollow back of resilient material, having extended clamping-plates arranged to hold a removable blade by spring-pressure, said back being open at the end and above the blade to receive a spreading or releasing key above the blade; substantially as described.

2. In a razor, a hollow back of resilient material, having extended substantially parallel clamping-plates, and a removable blade held between the said plates, said blades and plates having coacting projections and recesses, and the back being open to receive a spreading-tool above the blade; substantially as described.

3. In a razor, a hollow back of spring material forming a substantially complete ellipse, and having its free edges extended to form clamping-plates for holding a removable blade, said back having a shank extension; substantially as described.

4. In a razor, a tubular back of elliptical form having clamping-plates arranged to hold the blade by spring-pressure, and a turning-key arranged to spread the blades; substantially as described.

813,233. COMBINED DAVENPORT AND BED. ARTHUR H. PADDOCK, Lead, S. D. Filed July 26, 1905. Serial No. 271,334.



Claim.—1. A combined davenport or bed comprising a main frame provided with side pieces and rear standards, said frame being provided adjacent to said side pieces with guide-grooves and the standard with guide-grooves having forwardly-curved lower ends, a head-piece extending between and secured to the standards, seat and back sections comprising upholstered frames hingedly connected, the seat-frame being provided with runners movable in the guide-ways in the seat-frame and the back-frame, rollers to traverse the guides in the standards whereby the seat and back portions may be adjusted in unison to extend the seat portion beyond the main frame and to bring the back portion to the position normally occupied by said seat portion, and a strip upon the front edge of the seat portion to conceal the joint between the same and the main frame when the parts are in normal position.

2. A combined davenport and bed comprising a main frame composed of a bottom, side pieces, rear standards, and a head-piece extending between the standards, the bottom portion of the frame being provided adjacent to the side pieces and standards with guide-grooves having channeled wear-strips inserted therein, and the standards with vertical grooves having forwardly-projecting lower terminals, the top and bottom walls of said grooves forming stops, seat and back frames hingedly connected at their meeting edges, the seat-frame being provided at its ends with runners movable in the channeled guide-pieces and the back-frame upon the normally upper portions of its ends with rollers to travel in the guide-grooves in the standards and engage said stops, a strip secured to the front portion of the seat-frame to cover the joint between the same and main frame when the parts are in normal position, and a leg pivoted to the forward portion of the main frame and adapted to fold behind said strip.

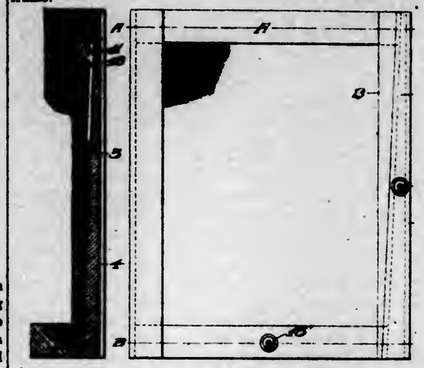
3. A sofa of the character described comprising a main frame provided at the front thereof with a receiving-recess and horizontal and vertical guideways, hingedly-connected seat and back portions provided with guide members to respectively travel in said horizontal and vertical guideways, the said seat portions being extendible beyond the frame and the back portion adjustable to the position normally occupied by the seat portion, a hinged supporting-leg upon the front rail of the seat portion adapted to be turned to an inactive position and to occupy said receiving-recess when the seat and back portions are restored to their normal positions, said leg having a lug, a strip upon the front rail of the seat portion to conceal the joint between the same and main frame and conceal the leg when the seat portion occupies its normal position, and a keeper-pin upon the rear side of said strip adapted to be engaged by the lug to hold the leg in folded position.

813,234. WINDOW-SCREEN FRAME. HUBERT B. PALLADY, Sebastopol, Cal. Filed Sept. 22, 1905. Serial No. 279,585.

Claim.—1. A screen or like frame having a light-aperture of fixed size, one of the side rails of the frame being divided diagonally into two sections, one of the sections being slidable lengthwise on and relative to the other to contract or to expand the frame transversely.

2. A screen or like frame having rigidly-connected top, bottom and side rails, one of said side rails being divided diagonally into two sections, one of said sections being movable lengthwise on the other to contract or expand the frame, and spring-actuated means carried by the sections operating to hold the sections normally in expanded position.

3. A screen or like frame comprising rigidly-connected top, bottom and side rail portions, one of said side-rail portions being provided with a lengthwise-movable wedge member, a follower on said wedge member, and a spring housed in a corresponding part of the frame coacting with the follower to move the wedge to expand the frame.



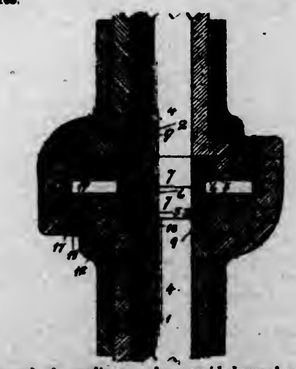
4. A screen or like frame having a side rail divided longitudinally into two wedge-shaped sections, the outer section movable lengthwise on the other to expand or contract the frame, a spring carried by one section, and a follower carried by the other section and coacting with the spring to hold the sections normally in expanded position.

5. A screen or like frame having top, bottom and side rails, one of said side rails divided diagonally into two sections, the outer section forming a wedge member movable lengthwise on the other section to expand or contract the frame, the inner edge of the outer section being longitudinally grooved, and the top and bottom rails of the frame having tenon portions projecting into said groove, and means for holding said sections together.

6. A screen or like frame having top, bottom and side rails, one of said side rails divided diagonally into two sections, the outer section forming a wedge member movable lengthwise on the other section to expand or contract the frame the inner edge of the outer section being longitudinally grooved and the top and bottom rails of the frame having tenon portions projecting into said groove, a spring housed in a slotted part in one of said sections, and a follower carried by the other section coöperating with the spring to hold the sections in normally expanded position.

7. The combination with a window-casing having vertical guides, of a screen or like frame slidably mounted in said guides, said frame having one of its sides diagonally divided into two sections, the outer of said sections forming a wedge with its widest end downward, said wedge movable lengthwise on the inside section to contract or expand the frame, and said sections coöperating to lock the frame at any desired point in the casing.

813,235. STEAM-PIPE COUPLING. WILLIAM J. PIER, Chicago, Ill., and LEE P. HYDE, Laporte, Ind. Filed Feb. 10, 1905. Serial No. 245,105.



Claim.—1. A coupling member provided round a portion of its engaging edge with a flange leaving an open space at one end and

being tapered or thickened away from the opening, a projecting wall having an inner diameter sufficient to embrace the tapered flange of a companion section and provided at its outer edge with an overhanging flange adapted to engage the tapered flange of the companion section, the flanges being beveled to interlock with one another and form a dovetail joint, and said walls adapted to be arranged opposite each other when the coupling is effected, substantially as described.

2. A coupling consisting of two companion sections each consisting of a circular coupling-sleeve having formed integrally around a portion of its periphery a flange terminating in an open space and thickened or tapered away from the open space, and terminating in a projecting wall formed integrally with the coupling-head having an inner curvature sufficient to embrace the tapered flange of the companion section and arranged so that the projecting walls will be opposite each other when the coupling is effected, and an inwardly-projecting engaging flange on each of the projecting walls adapted to engage a tapered flange of a companion section, all of the flanges being beveled to interlock with one another and form a dovetail joint, each of the coupling-sleeves having within it a tubular member having at its engaging end a rubber gasket, the two gaskets being adapted to contact with one another when the coupling is locked, substantially as described.

3. A coupling consisting of two companion sections each consisting of an inner tubular shank having an enlarged head, companion gaskets within the enlarged heads, coupling-sleeves surrounding the tubular shanks and each provided around a portion of its edge with a tapered flange formed integrally therewith, leaving an opening at its thinnest point, each of the flanges terminating in a projecting wall, adapted to be arranged opposite each other when the coupling is effected, said walls being formed integrally with the coupling-sleeve, and each having around its edge an inwardly-projecting flange adapted to engage the tapered flange of the companion section, all of the flanges being beveled to interlock with one another, substantially as described.

4. A coupling consisting of two companion sections each consisting of a coupling-sleeve provided around a portion of its rim with a retaining-flange formed integrally therewith leaving an opening at one end, and each of the sleeves being further provided with a forwardly-projecting wall formed integrally therewith, said walls adapted to be arranged opposite each other when the coupling is effected and each having an interior diameter sufficient to embrace the retaining-flange of the companion section, and having an inwardly-projecting engaging flange integrally formed with the coupling-sleeve and adapted to coact with the retaining-flange of the companion section, one of the flanges being inclined to lock with its companion flange after a predetermined degree of revolution of the two sections, and all of the flanges being beveled to interlock with one another and form a dovetail joint, substantially as described.

5. A coupler consisting of two companion sections each consisting of a coupling-sleeve provided around a portion of its rim with a retaining-flange formed integrally therewith, leaving an opening at one end, and each of the sleeves being further provided with a forwardly-projecting wall formed integrally therewith said walls adapted to be arranged opposite each other when the coupling is effected, and each having an interior diameter sufficient to embrace the retaining-flange of the companion section, and having an inwardly-projecting engaging flange adapted to coact with the retaining-flange of the companion section, one of the flanges being inclined to lock with its companion flange after a predetermined degree of revolution of the two sections, all of the flanges being beveled to interlock with one another and form a dovetail joint, and a tubular shank passing through each of the coupling-sleeves, and having a counterbore on its inner face, companion gaskets fitted into and outwardly projecting from the counterbores, substantially as described.

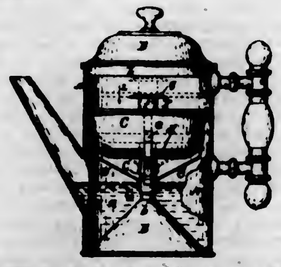
6. A coupler consisting of two companion sections each consisting of a coupling-sleeve provided around a portion of its rim with a retaining-flange formed integrally therewith, leaving an opening at one end, and each of the sleeves being further provided with a forwardly-projecting wall formed integrally therewith said walls adapted to be arranged opposite one another when the coupling is effected and each having an interior diameter sufficient to embrace the retaining-flange on the companion section, and having an inwardly-projecting engaging flange adapted to coact with the retaining-flange of the companion section, one of the flanges being inclined to lock with its companion flange after a predetermined degree of revolution of the two sections, all of the flanges being beveled to interlock with one another and form a dovetail joint, and a tubular shank passing through each of the coupling-sleeves, and having a counterbore on its inner face, companion gaskets fitted into and outwardly projecting from the counterbores, and a split ring for each section entered into a recess in the counterbore for holding each of the gaskets in place, substantially as described.

813,286. APPARATUS FOR SUPPLYING LIQUID FUEL TO BURNERS OF LAMPS AND LANTERNS. THOMAS C. PURDY, Paris, France. Filed June 16, 1905. Serial No. 265,610.

Claim.—1. In an apparatus of the character described, the combination of a cylinder, a piston located therein, a supply-pipe, a valve automatically operated to prevent the return of fluid through said pipe, and a main open to the cylinder.

2. In an apparatus of the character described, the combination of a hollow stationary piston, a supply-pipe communicating therewith, a weighted cylinder working on the piston, a valve in the head of the piston adapted to be automatically closed by the pressure in the cylinder, and a main mounted in the piston-head open to the cylinder.

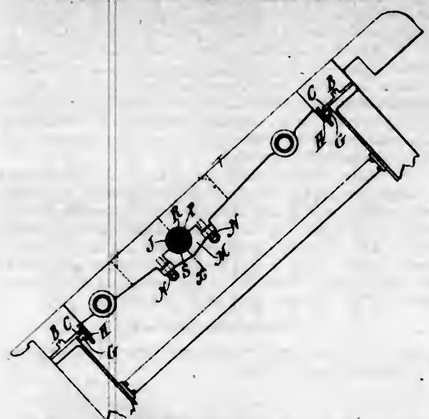
813,287. ATTACHMENT FOR COFFEE-POTS. ROBERT F. RANDALL and HARRY V. PEIRSON, Newark, N. Y., assignors of two-thirds to said Peirson and one-third to said Randall. Filed Mar. 20, 1905. Serial No. 251,733.



Claim.—1 The herein-described coffee-pot, comprising a body, a removable attachment within said body and comprising an inverted funnel resting directly on the bottom of said body, a rigid central vertical tube piercing the apex of said funnel and extended downwardly into the said funnel and terminating at a distance from the bottom, the upper end of said tube having an annular enlargement, a tube sleeved upon said tube and over said enlargement, a percolator carried by said tube and having a bottom of fine-mesh material, a perforated plate within said percolator, a thimble rigid with said plate at the center thereof and sleeved upon the outer tube, and a spreader carried by the upper end of the said thimble.

2. The coffee-pot attachment described comprising an inverted funnel, a central vertical tube rigid therewith, a portion extended above the apex of the funnel and a portion extending well into the funnel and terminating above the bottom thereof, a tube telescopically engaged over said tube, braces extending from said tube, a percolator rigid with said tube and its braces and having reticulated bottom, a removable perforated spreader having a rigid tubular part telescopically engaged over the last-named tube, and a flange movable with said spreader and rigid with its tubular part.

813,288. DEVICE FOR PREVENTING THE SHAFTS OR ARBORS OF SAW-BLADES FROM SAGGING. THOMAS B. REED, Jr., Philadelphia, Pa. Filed June 3, 1904. Serial No. 210,942.



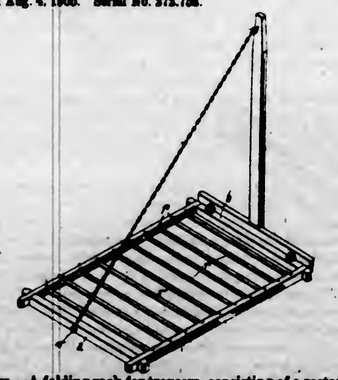
Claim.—1. A saw-carrying shaft, a cross-head, a support for the latter, said head having its body longitudinally divided forming separate side members and blocks connected with the under portions of said members, said body and blocks forming a plurality of bearings for said shaft and firmly sustaining the same respectively on opposite sides of the saw.

2. A shaft, a saw longitudinally movable thereon, a cross-head, a support for the latter, said head having its body longitudinally divided forming separate side members, blocks connected with the under portions of said members and means on said head and support, whereby said head is laterally movable on said support, said body and blocks forming a plurality of bearings for said shaft and firmly sustaining the same respectively on opposite sides of the saw.

3. A frame, a track thereon, a member projecting inwardly from said frame and overhanging the inner side thereof, a saw-carrying shaft, a cross-head forming the bearing for said shaft and being movably supported on said track and a piece projecting outwardly from said cross-head and freely engaging said overhanging member of the frame from below.

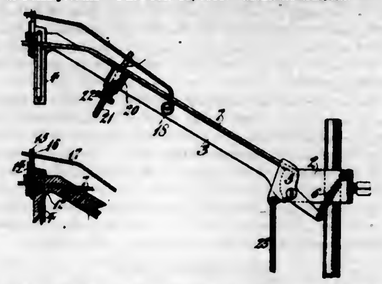
4. A frame, a track thereon, a member projecting inwardly from said frame and overhanging the inner side thereof, a saw-carrying shaft, a cross-head forming the bearing for said shaft, and being movably supported on said track, a piece projecting outwardly from said cross-head and freely engaging said overhanging member of the frame from below, and means for vertically adjusting said piece on said cross-head.

813,289. TROUSERS-RACK. MAX ROSENBERG, Philadelphia, Pa. Filed Aug. 4, 1905. Serial No. 272,788.



Claim.—A folding rack for trousers, consisting of a rectangular rack-frame having notched side bars, and removable rack-bars, and hinged thereto, a L-form wall-frame having a central upright bar longer than the rack-frame and provided with a rearward-projecting fastening-eye near its lower end and a forward-projecting hook at its upper end, and an adjusting-chain connected to the end of the rack-frame and having engagement with said hook, substantially as specified.

813,240. STOP-MOTION FOR KNITTING-MACHINES. GEORGE W. REVE, York, Pa., assignor to Ruth Machine Company, a Corporation of Pennsylvania. Filed Jan. 18, 1905. Serial No. 241,522.



Claim.—1. In a device of the character described, supporting means for carrying the yarn, means connected with said supporting means for operating a stop-motion, holding means for said supporting means, spring means extending substantially lengthwise of and connected with said holding means, and means at an angle to said spring means for adjusting the tension of the latter.

2. In a device of the character described, yarn-supporting means pivotally mounted, means connected with said supporting means for operating a suitable stop-motion, means engageable with said supporting means for holding same in operative position, springs suitably connected with and extending substantially lengthwise of said holding means and means at right angles to the length of said springs for adjusting the tension of the latter.

3. In a device of the character described, hooks for supporting the yarn, dogs engaging with said hooks for holding the same in operative position, spring-arms extending in the direction of the length of the hook-supporting means engaging with and carrying said dogs for normally depressing same and means at right angles to the length of said spring-arms for independently adjusting the tension of said spring-arms for varying the pressure on said dogs.

4. In a device of the character described, hooks pivotally supported, dogs adapted to engage with said hooks for holding the same in operative position, rods movably connected with said hooks, plates connected with said rods, springs extending in the direction of the length of the hook-supporting means for operating said plates, spring-arms supporting and contacting with said dogs for normally depressing the same, pins disposed at right angles to the length of said springs and engaging with said spring-arms and means for adjusting said pins whereby the tension on said dogs may be varied.

5. In a device of the character described, a head, plates pivotally attached thereto, springs having one end attached to said head and the other end to said plates, rods projecting from said plates, a block carried by said head, said rods moving in slots in said block, hooks pivoted to said block and having slots in their body portion in which said rods are adapted to move, depressions in said hooks, dogs carried by said block adapted to engage in said depressions, spring-arms suitably supported parallel with the length of said rods and in engagement with said dogs, pins at right angles to and having portions loosely engaging with said spring-arms and independent means for adjusting said pins for varying the tension of said spring-arms on said dogs.

6. In a device of the character described, a stationary slotted guard formed of a plate and a finger having a lateral arm coacting with the slot of said guard and adapted to be sustained by the yarn, said finger being provided with a lug, a spring-actuated lever having a head to engage said lug, and a dog having a nose in the path of said lever.

7. In a device of the character described, a stationary slotted guard formed of a plate and a finger having a lateral arm coacting with the slot of said guard and adapted to be sustained by the yarn, said finger being provided with a lug, a spring-actuated lever having a head to engage said lug, and a dog having a nose in the path of said lever and a tip in the path of said lug.

8. In a device of the character described, a support, slotted

hooks pivotally mounted thereon and having depressions adjacent their pivots, spring-held means adapted to engage said depressions, spring-arms extending lengthwise of said support and carrying said means for normally depressing same and means at right angles to the length of said spring-arms for independently adjusting the tension of said spring-arms for varying the pressure on said means.

7. In a power plate-printing press, an automatically-reciprocable polisher comprising a plurality of rotatable members having pol-

tongues formed by pressing said side flanges inwardly, blocks adapted to slide longitudinally into the space between said flanges, said

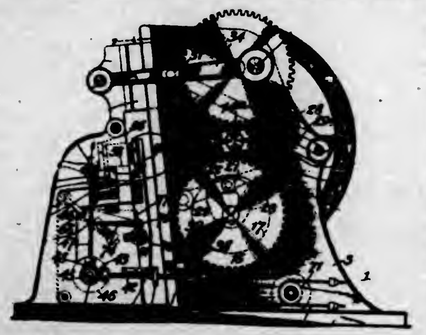
Claim.—1. A hexagonal packing-case provided with series of diagonally-arranged partitions located on different levels, substan-

hooks pivotally mounted thereon and having depressions adjacent their pivots, spring-held means adapted to engage said depressions springs extending lengthwise of said support and carrying said means and means movable in guides on said support and in slots of said hooks, and means for adjusting the said springs to vary their tension.

9. In a device of the character described, a support, hooks pivotally mounted thereon and having longitudinal slots, holding means for normally holding said hooks in a horizontal position, vertical guides on said support, pivotally-mounted plates, rods carried thereby with their free ends engaged in the slots of said hooks and in the guides of said support, springs having one end fixed relatively to said rods and disposed lengthwise thereof and operatively engaged with said holding means.

10. In a device of the character described, a support, hooks pivotally mounted thereon and having longitudinal slots, spring-held means for normally holding said hooks in a horizontal position, vertical guides on said support, pivotally-mounted plates, rods carried thereby with their free ends engaged in the slots of said hooks and in the guides of said support, springs having one end fixed relatively to said rods and disposed lengthwise thereof and operatively engaged with said holding means, and means at right angles to said rods and operatively connected with said springs to vary their tension.

818,241. **POWER PLATE-PRINTING PRESS.** HERMAN J. SCHMIDT, Brooklyn, N. Y. Filed June 8, 1905. Serial No. 264,369.



Claim.—1. In a power plate-printing press, a reciprocal plank adapted to carry a plate, an automatically-reciprocal polisher comprising a plurality of concurrently-rotatable disks having their polishing-surfaces flush, automatically-reciprocal cleaning means and inking means, substantially as described.

2. In a power plate-printing press, a reciprocal plank adapted to carry a plate, an automatically-reciprocal polisher, comprising a plurality of concurrently-rotatable disks having their polishing-surfaces flush, automatically-reciprocal dusting means, automatically-reciprocal cleaning means and inking means, substantially as described.

3. In a power plate-printing press, a reciprocal plank adapted to carry a plate, reciprocal blocks, an automatically-reciprocal polisher carried by one of said blocks and comprising a plurality of rotatable disks having their polishing-surfaces flush, automatically-reciprocal cleaning means carried by the other of said blocks, and means connecting said blocks for concurrent simultaneous reciprocal movement, substantially as described.

4. In a power plate-printing press, a reciprocal plank adapted to carry a plate, an automatically-reciprocal polisher, comprising a plurality of rotatable disks having their polishing-surfaces flush, means for causing concurrent rotary movement of said disks, and cleaning means comprising an automatically-reciprocal block and a strip of fabric adapted to be moved automatically across the face of said block, substantially as described.

5. In a power plate-printing press, a reciprocal plank adapted to carry a plate, a polisher comprising an automatically-reciprocal block, rotatable shafts therein and polishers on said shafts, and cleaning means comprising an automatically-reciprocal block and a strip of fabric adapted to be moved automatically across the face of said block, substantially as described.

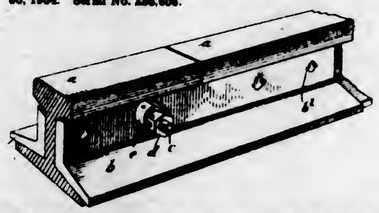
6. In a power plate-printing press, an automatically-reciprocable polisher comprising a plurality of concurrently-rotatable disks having their polishing-surfaces flush, substantially as described.

7. In a power plate-printing press, an automatically-reciprocable polisher comprising a plurality of rotatable members having polishing-surfaces, dusting means adapted to be automatically reciprocated across the faces of the polisher, automatically-reciprocable cleaning means, and inking means, substantially as described.

8. In a power plate-printing press, a reciprocable plank adapted to carry a plate, a reciprocable block having concurrently-rotatable polishers comprising disks having their polishing-surfaces flush, a reciprocable block located below the first-mentioned block and having wiping means, means connecting said blocks for simultaneous concurrent reciprocable movement and means for reciprocating said blocks, substantially as described.

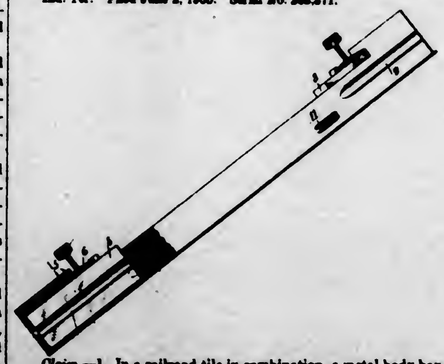
9. In a power plate-printing press, a reciprocal plank, adapted to carry a plate, a reciprocable block having rotatable shafts provided with polishers, gearing connecting said shafts for simultaneous rotation, a reciprocable block located below the first-mentioned block and having wiping means, means connecting said blocks for simultaneous reciprocable movement, means for reciprocating said blocks and dusting means adapted to be automatically reciprocated across the faces of said polishers, substantially as described.

818,242. **NUT-LOCK.** HENRY SIMMER, Morley, Iowa. Filed Sept. 30, 1904. Serial No. 228,666.



Claim.—The combination of a bolt, a collar on the bolt and provided with lugs on its inner face for entering cavities in a part through which the bolt passes, a nut on the bolt and provided in the exterior of its body with a plurality of notches, said notches extending out through the inner end of the nut and having their bottom walls beveled downwardly and inwardly, and a dog pivoted to the washer and having its under face at the outer end beveled upwardly and outwardly, said dog being adapted to enter one of the recesses of the nut to lock the same, substantially as herein shown and described.

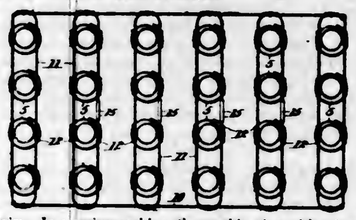
818,243. **RAILROAD-TIE.** CHARLES R. SHANNON, Marble City, Ind. Ter. Filed June 2, 1905. Serial No. 263,371.



Claim.—1. In a railroad-tie in combination, a metal body having side flanges projecting upwardly, said side flanges having extensions at the extremities of said body, said extensions having recesses formed thereunder adapted to receive the outer edges of the rail-flanges, blocks disposed between said first flanges and adapted to support the rails, and fastening devices for securing the inner edges of the rails to said blocks, said flanges having longitudinally-disposed steps formed in a depressed position on the inner faces of said flanges, said steps abutting the inner faces of said blocks to fix the same against inward movement.

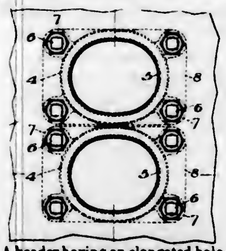
2. In a railroad-tie in combination, a metal body having side flanges projecting upwardly and having longitudinally-disposed tongues formed by pressing said side flanges inwardly, blocks adapted to slide longitudinally into the space between said flanges, said blocks having longitudinal grooves in the side faces thereof adapted to receive said tongues, stops formed by pressing said flanges inwardly and engaging the inner ends of said blocks to lock the same against inward movement, and means for fastening the rails to said blocks.

818,244. **CUSHION-SPRING.** WATSON R. SMITH, Jackson, Mich. Filed Nov. 19, 1904. Serial No. 233,546.



Claim.—In a spring-cushion, the combination with a frame, of support-wires arranged in pairs therein, springs mounted upon corresponding pairs of support-wires, means for securing the springs to the support-wires, a border-wire disposed above and in alinement with the outer edge of the aforesaid frame, and a pressure-distributing element comprising a single piece of material, bent to form parallel side members for engagement with opposite sides of the tops of alining-springs, the ends of the said element being forced against the under face of each side of the border-wire by said springs, and means engaging the said ends of said element and the sides of the border-wire to hold them together.

818,245. **HEADER CONNECTION.** JAMES P. SHEDDON, Barberton, Ohio, assignor to The Stirling Consolidated Boiler Company, New York, N. Y., a Corporation of New Jersey. Filed Nov. 11, 1904. Serial No. 232,333.



Claim.—1. A header having an elongated hole at its end, a drum having a corresponding elongated hole and having an integral flange provided with inclined inner faces and a coned nipple engaging said inclined faces; substantially as described.

2. A header having an elongated hole at its end, and a drum having a similar elongated hole in alinement therewith, said holes having inclined inner faces, and a double-coned nipple engaging said inclined faces; substantially as described.

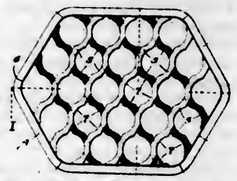
3. A header having an elliptical hole at its end, a drum having a corresponding elliptical hole having an outwardly-flaring flange secured in registry therewith, and a nipple fitting in the registering holes, and means for drawing the parts together; substantially as described.

4. The combination with a drum having elongated holes arranged side by side with their minor axes substantially in line and having outwardly-flaring flanges, of headers having correspondingly-elongated holes registering with the holes in the drum, and nipples having inclined sides fitting in the registering holes; substantially as described.

5. A header having an elongated hole at its end, a drum having a similarly-shaped hole secured in registry therewith, a double-coned nipple fitting in the registering holes, and connections for drawing the parts together; substantially as described.

818,246. **PARTITIONED PACKING-CASE.** ARTHUR R. SPEER, Pittsburg, Pa. Filed Apr. 1, 1905. Serial No. 253,256.

Claim.—1. A hexagonal packing-case provided with series of diagonally-arranged partitions located on different levels, substantially as set forth.



2. A hexagonal packing-case provided with diagonally-arranged partitions, provided with alternately-arranged recesses, substantially as set forth.

3. A hexagonal packing-case provided with rounded corners and series of partitions arranged parallel with the ends of the case, and located at different levels, substantially as set forth.

4. A hexagonal packing-case of sheet metal provided with diagonally-arranged series of cross-partitions having concave recesses, substantially as set forth.

5. A hexagonal packing-case of sheet metal provided with diagonally-arranged series of cross-partitions formed of strips of sheet metal pressed to provide concave bottle-engaging recesses, substantially as set forth.

6. A partition member consisting of a strip of sheet metal having lateral concave recesses formed by bending the edge of the strip, substantially as set forth.

7. A partition member consisting of a strip of sheet metal having alternately-arranged lateral concave recesses formed by bending the edges of the strip, substantially as set forth.

8. A hexagonal packing-case provided with rounded corners and series of partitions arranged at different levels and parallel with the ends of the case, said series extending transversely of each other, substantially as set forth.

818,247. **MANUFACTURING GLASS.** JAMES R. SPEER, Pittsburg, Pa., assignor to Brownsville Glass Company, Pittsburg, Pa., a Corporation of Pennsylvania. Filed Apr. 1, 1905. Serial No. 253,257.

Claim.—1. In an apparatus for drawing hollow glass bodies, wherein a gaseous pressure is supplied within the body during operation, means for equalizing the pressure throughout the body.

2. In an apparatus for drawing hollow glass bodies, means for containing the glass to be drawn, a drawing-tool arranged to draw a hollow body, means for supplying gaseous fluid to the interior of said body during the drawing operation, and means for equalizing the pressure of the gaseous fluid throughout the body.

3. In an apparatus for drawing hollow glass bodies, means for containing the glass to be drawn, a drawing-tool arranged to draw a hollow body, and a plurality of ducts leading to different longitudinal portions of the interior of the glass cylinder being formed from means for supplying a gaseous fluid thereto.

4. In an apparatus for drawing hollow glass bodies,

4. In an apparatus for drawing hollow glass bodies, means for containing the glass to be drawn, a drawing-tool arranged to draw a hollow body, and a plurality of ducts leading separately from different longitudinal portions of the interior of the glass cylinder being formed to a common supply of gaseous fluid.

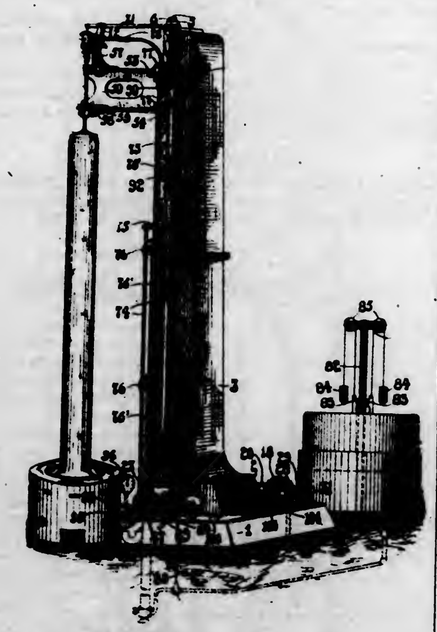
5. In an apparatus for drawing hollow glass bodies, means for containing the glass to be drawn, a drawing-tool arranged to draw a hollow body, a gaseous-fluid-supply pipe, and branch pipes connected thereto and leading from the exterior to different longitudinal portions of the interior of the cylinder being formed.

6. In an apparatus for drawing hollow glass bodies, means for containing the glass to be drawn, a drawing-tool arranged to draw a hollow body, a gaseous-fluid-supply pipe, and branch pipes connected thereto and leading to different longitudinal portions of the cylinder being formed.

7. A step in the process of drawing hollow glass bodies which consists in supplying gaseous fluid to the interior thereof simultaneously equalizing the pressure of the gas throughout the body.

8. A step in the process of drawing hollow glass bodies which consists in supplying gaseous fluid to the interior at two or more different points thereof simultaneously equalizing the pressure of the gas throughout the body.

813,248. GLASS-DRAWING APPARATUS. JAMES B. SPEER, Pittsburg, and GEORGE H. HARVEY, Clenfield, Pa., assignors to Brownsville Glass Company, Pittsburg, Pa., a Corporation of Pennsylvania. Filed July 26, 1905. Serial No. 271,143.



Claim.—1. In the art of drawing hollow glassware, a vertically-movable drawing-tool, and a pipe connected thereto to supply fluid-pressure to the interior of the hollow ware, said pipe including a telescopic portion extensible during the upward movement of the tool to permit the vertical movements of the drawing-tool without interrupting the fluid-supply pipe.

2. In the art of drawing hollow glassware, a drawing-tool, a vertically-movable carriage therefor, means for moving the carriage upwardly at the desired speed and a second means for moving the carriage downwardly at a greater speed.

3. In the art of drawing hollow glassware, a hollow drawing-tool, a fluid-supply pipe and a rigid detachable connector between them to hold the drawing-tool rigid.

4. In the art of drawing hollow glassware, a drawing-tool, means for supplying fluid-pressure to the interior of the glassware, and a movable member constituting a part of the fluid-supply conduit for locking the drawing-tool in operative position.

5. In the art of drawing hollow glassware, a drawing-tool, means for raising and lowering the same, a driving means, separate driving connections between the raising and lowering means and the driving means.

6. In the art of drawing hollow glassware, a drawing-tool, means for raising and lowering the same, a driving means, and separate driving connections between the raising and lowering means and the driving means, one of the connections being flexible to prevent vibration of the said means.

7. In the art of drawing hollow glassware, a drawing-tool, a screw for raising and lowering the same, two driving connections therefor, and means for making operative either connection.

8. In the art of drawing hollow glassware, a vertically-movable carriage, a fluid-supply connection carried thereby, a valve in said connection and non-traveling means for operating said valve at all positions of the carriage.

9. In the art of drawing hollow glassware, a drawing-tool, a carriage to support the same, a standard to guide the carriage, a screw for operating the carriage, and means for suspending the screw from a part relatively distant from its lower end.

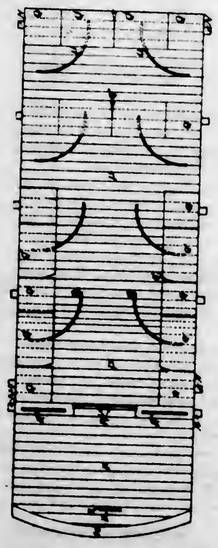
10. In the art of drawing hollow glassware, a drawing-tool, a carriage to support the same having therein a socket, a standard to guide the carriage, a screw for operating the carriage, and a nut on the screw and in said socket.

11. In the art of drawing hollow glassware, a traveling drawing-tool, a pipe for supplying a fluid within the draw and a telescopic portion connected thereto extensible during the draw, whereby excess pressure of fluid within the draw is minimized by the gradual increasing area of the telescopic portions during the upward travel of the drawing-tool.

12. In the art of drawing hollow glassware, a traveling drawing-tool, means for transmitting fluid-pressure through the tool to the interior of the draw, a plurality of means for controlling the flow of the fluid to the said means, one of the controlling means traveling with the tool and means by which the latter controlling means may be operated during the entire draw.

13. In the art of drawing glassware, a drawing-tool, a carriage therefor, a screw adapted to rotate and a non-rotating nut adapted to move said carriage by the rotation of said screw.

813,249. CONVERTIBLE CAR. FRANK H. STANLEY and JOHN L. GILLMORE, Bellingham, Wash. Filed Sept. 13, 1904. Renewed Aug. 13, 1905. Serial No. 274,013.



Claim.—1. In a convertible car, a plurality of movable seats, a rotary operating-shaft extending approximately the entire length of the car, and means connected with the operating-shaft for moving the seats.

2. In a convertible car, a plurality of pivotally-mounted seats, a rotary operating-shaft extending approximately the entire length of the car, and means connected with the operating-shaft for moving the seats.

3. In a convertible car, a plurality of pivotally-mounted seats, a rotatable shaft extending longitudinally of the car, and flexible elements connecting said shaft with the seats.

4. In a convertible car, a plurality of movable seats, an operating-shaft, flexible elements connecting said shaft with said seats, and strain-receiving and tightening means for said flexible elements.

5. In a convertible car, a plurality of movable seats, flexible elements for operating said seats, and strain-receiving and tightening means connected with said flexible elements.

6. In a convertible car, a plurality of movable seats, an operating-shaft, a plurality of flexible elements connecting said shaft with said seats, and a plurality of coil-springs connected with said flexible elements.

7. In a convertible car, a plurality of movable seats, a plurality of auxiliary seats adapted to coöperate therewith, and means for simultaneously moving the movable seats.

8. In a convertible car, a plurality of movable seats, a plurality of auxiliary seats adapted to coöperate therewith, means for moving the movable seats, and means for holding the auxiliary seats in elevated position, during the movement of the movable seats.

9. In a convertible car, a slotted floor, a plurality of movable foot-pieces beneath the floor, a standard on each of the foot-pieces projecting upwardly through the slotted floor, a seat on each of the standards, and means for moving the foot-pieces.

10. In a convertible car, a slotted floor, a plurality of movable foot-pieces beneath the floor, a standard on each of the foot-pieces projecting upwardly through the slotted floor, a seat on each of the standards, and means for simultaneously moving the foot-pieces.

11. In a convertible car, a slotted floor, a plurality of foot-pieces pivotally mounted beneath said floor, a seat-support connected with each foot-piece, and extending through the slotted floor, a seat on each seat-support, and means for simultaneously moving said pivotally-mounted foot-pieces.

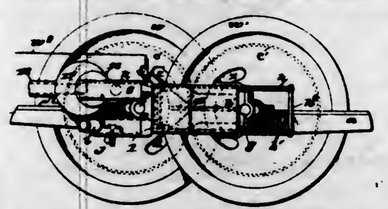
12. In a convertible car, a plurality of pivotally-mounted foot-pieces, a seat upon each of the foot-pieces, an operating-shaft, and flexible elements connecting the operating-shaft with the foot-pieces.

13. In a convertible car, a slotted floor, a plurality of pivotally-mounted foot-pieces below said floor, a seat-support on each of said foot-pieces, a seat on each seat-support, a stationary seat-support on said floor adjacent to each foot-piece, an auxiliary seat removably mounted on each stationary seat-support, an operating-shaft extending longitudinally of the car, and a plurality of flexible elements connecting said shaft with said foot-pieces.

14. In a convertible car, a plurality or movable seats, means for moving said seats, a stationary seat-support adjacent to each movable seat, and an auxiliary seat removably connected with each of the stationary seat-supports.

15. In a convertible car, a plurality of movable seats, means for moving said seats, a seat-back coöperating with each seat, and removable brackets secured to each seat-back.

813,250. INTERNAL-COMBUSTION ENGINE. CLARENCE M. STEELE, Statesville, N. C. Filed Apr. 7, 1905. Serial No. 254,312.



Claim.—1. An internal-combustion engine, comprising two parallel crank-shafts, a cylinder hung on one crank-shaft and a piston hung on the other crank-shaft, means for holding the same parallel, and means for maintaining the intake and exhaust connections.

2. An internal-combustion engine, comprising a pair of parallel crank-shafts, gears for connecting them to run in opposite directions and at the same speed, the combined throw of the cranks equaling the stroke of the engine, a cylinder mounted upon one crank, and a piston mounted upon the other crank, whereby the shock of the explosion is absorbed equally by the two cranks to eliminate recoil and increase the economy.

3. An internal-combustion engine, comprising two parallel crank-shafts, a cylinder mounted on one crank-shaft, a piston mounted upon the other crank-shaft and a fly-wheel for each crank-shaft having an excess of weight on one side to balance the weight of the cylinder and the piston.

4. An internal-combustion engine, comprising two parallel crank-shafts, gears for connecting them to run in opposite directions, a cylinder hung on one crank-shaft, a piston hung upon the other crank-shaft, said cranks having together a throw equal to the stroke of the engine and the piston and cylinder having a rectilinear reciprocation to and from each other and a parallel lateral motion at right angles to the line of rectilinear reciprocation.

5. An internal-combustion engine, comprising a crank-shaft, a cylinder hung on the crank of said shaft and a fuel-supply for the cylinder consisting of a hollow crank having the same stroke as the crank on which the cylinder is hung.

6. An internal-combustion engine, comprising a crank-shaft, a cylinder hung on the crank of said shaft, and an exhaust connection for the cylinder consisting of a stationary exhaust-pipe having a terminal face-plate with the exhaust-pipe opening through the center of it, the plane of the face-plate being parallel to the longitudinal axis of the cylinder and a lateral outlet from the cylinder lying parallel to and scouring against said face-plate.

7. An internal-combustion engine, comprising a crank-shaft, a cylinder hung on the crank of said shaft and an exhaust connection for the cylinder consisting of two scouring-faces, both of said faces having openings through them and one of said faces having an extended flange to always cover the opening in the other face throughout all positions of the cylinder.

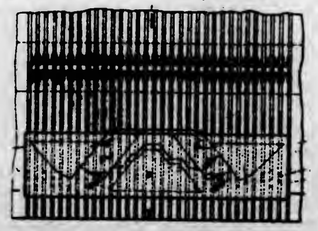
8. An internal-combustion engine, comprising a crank-shaft, a cylinder hung on the crank of said shaft, an exhaust-valve having a stem extending laterally to the cylinder and partaking of the rotary motion of the said cylinder, mechanism for opening said exhaust-valve consisting of a relatively stationary push-plate made large enough to cover the traverse of the exhaust-valve, a stationary frame supporting said push-plate and means for forcing the push-plate against the valve.

9. An internal-combustion engine, comprising a crank-shaft, a cylinder hung on the crank of said shaft, an exhaust-valve extending laterally to the cylinder and mechanism for opening said exhaust-valve consisting of a push-plate made large enough to cover the traverse of said valve, said push-plate being constructed and arranged to revolve and means for forcing it against the valve.

10. An internal-combustion engine, comprising a crank-shaft, a cylinder hung on the crank of said shaft, an exhaust-valve extending laterally to the cylinder, a push-plate for opening said exhaust-valve made large enough to cover the traverse of said valve, means for automatically operating the push-plate by the engine and means for operating the push-plate manually and at will in starting the engine.

11. An internal-combustion engine, comprising a crank-shaft, a cylinder hung on the crank of said shaft, an exhaust-valve extending laterally to the cylinder, a push-plate covering the traverse of said valve, a slide-bar attached to the push-plate, a gear-wheel having a cam on its side operating the slide-bar and another gear-wheel meshing with the first-named and fixed to the crank-shaft.

813,251. KNITTING-MACHINE. HEINRICH STOLL, Jr., Reutlingen, Germany. Filed Oct. 5, 1905. Serial No. 282,897.

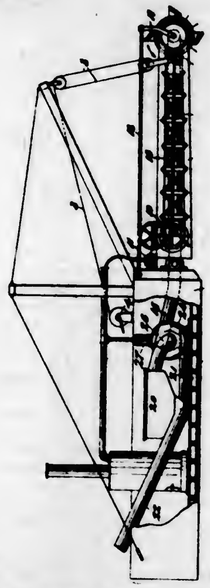


Claim.—1. In a through-and-through knitting-machine, a grooved bed, needles arranged therein, jacks for operating the nee-

dles, said jacks having feet of different height, and feet-engaging cams having actuating-surfaces of different lateral extent; substantially as described.

2. In a through-and-through knitting-machine, a grooved bed, needles arranged therein, jacks for operating said needles, said jacks having feet of different length, and cams acting on said feet to effect different lengths of needle-stroke and corresponding differences in the character of the mesh of the fabric; substantially as described.

813,252. **DREDGER.** VICTOR A. STROM, Alameda, Cal., assignor of one-half to Wm. H. Williamson, Alameda, Cal. Filed Mar. 31, 1905. Serial No. 253,694.



Claim.—1. In a dredger, a float, a hinged ladder projecting therefrom, with means for raising and lowering its front end, an excavator carried upon the front of said ladder, an internal receiver into which the excavator discharges, said receiver having a closed bottom and open top, means whereby the receiver may be turned axially relative to the ladder to maintain its open portion substantially uppermost during the raising or lowering of said ladder, and a suction-pipe connecting with the receiver.

2. In a dredger, a float, a ladder hinged thereto, an excavator consisting of a hollow revolvable drum, buckets carried upon the periphery of said drum, said buckets having the rear inner portions opening to the interior of the drum, a receiver consisting of a drum closed at the bottom and open at the top and having open communication through the ends of the drums, and means connecting with the second drum for turning said drum relative to the ladder whereby its open top is maintained substantially uppermost during the raising or lowering of said ladder, and a suction-pipe leading from said second drum.

3. In a dredger, a float, a ladder hinged thereto, an excavator journaled upon the front of the ladder, said excavator comprising a drum having openings in the periphery, buckets fixed to the periphery of the drum having the inner rear portions opening and coincident with the openings in the drum, a receiver consisting of a second drum located within the first one having the lower portion closed, the upper portion open and levers connecting said drum with the front of the float whereby the open portion is maintained upon the upper side during the raising or lowering of the ladder.

4. In a dredger, a float, a ladder hinged to the front thereof, mechanism by which the outer end of the ladder may be raised or depressed, a revolvable drum journaled upon the outer end of the ladder having openings in its periphery, scoop-shaped buckets fixed over said openings and adapted to discharge therethrough, an interior drum having the upper side open to receive discharged material, arms connected with said interior drum, and rods connecting said arms with the front of the dredge-boat, said arms acting to revolve the interior drum with relation to the outer one so as to present the opening upwardly at any position of the ladder.

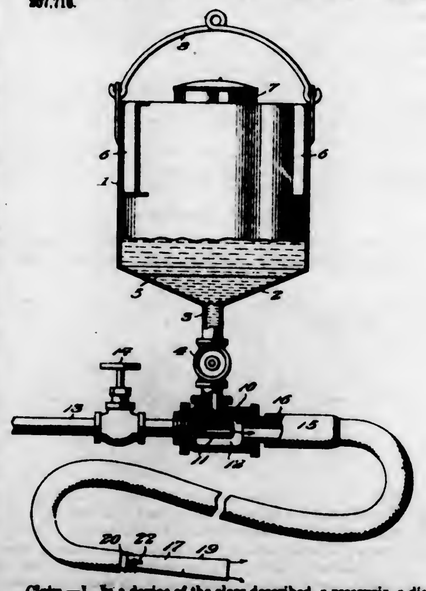
5. In a dredger, a float, a ladder hinged thereto, means for raising and depressing the ladder, an excavating apparatus located upon the front of the ladder, a suction-pipe into which material excavated is delivered, said pipe leading along the ladder and into the float, a suction-pump, a closed casing interposed between the pump and the suction-pipe, said casing having an opening in the bottom through which heavy material will drop by gravitation and a connection with the pump in line with the main discharge-pipe.

6. In a dredge, a float, a ladder hinged thereto, means by which the ladder is raised or depressed, an excavating apparatus carried upon the front of the ladder, a suction-pipe extending from said apparatus into the float, a suction-pump, a receiver into which the suction-pipe delivers, a discharge-opening in the bottom of said receiver through which heavy material falls by gravitation, connection between the suction-pump and the receiver out of line with the main suction-pipe, a discharge-pipe connecting with the bottom of the receiver into which pipe the spoils deliver, and a jet-tube discharge from the suction-pump in line with the main discharge-pipe.

813,253. **MOLD.** JOHN H. SULLIVAN, Grand Rapids, Mich. Filed June 15, 1905. Serial No. 265,269.

Claim.—The herein-described mold, consisting of the planks 1 provided with apertures and a fastener consisting of a sheet-metal body portion 4, formed with oppositely-projecting pairs of right-angular flanges 5, said flanges having apertures 8 located to aline with the apertures in the planks 1, said fastener being secured at the meeting edges of the planks by means of tie-rods 9 passed through the alining apertures in the planks and fastener, as described.

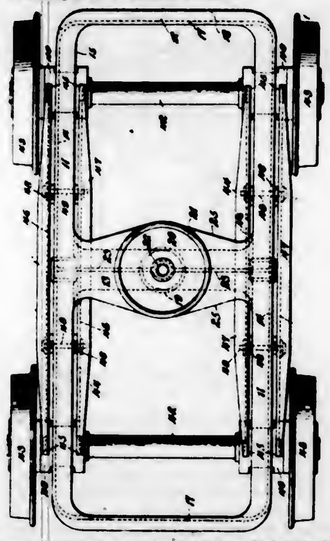
813,254. **SPRAY.** JAMES M. SWEENEY, Anaconda, Mont., assignor of one-third to Fred M. Schwartz, Anaconda, Mont., and one-third to Hugh H. Sweeney, Seattle, Wash. Filed Apr. 27, 1905. Serial No. 257,716.



Claim.—1. In a device of the class described, a reservoir, a discharge-duct communicating therewith and a spraying-nozzle carried by the duct, said nozzle comprising a pair of relatively movable sections comprising said portions and overlapping edge flanges, and means for securing the sections in relatively adjusted positions.

2. In a device of the class described, a spraying-nozzle comprising a tubular portion, a pair of relatively movable sections pivoted at one end to said portion, said sections having overlapping edge flanges and being adjustable for varying the size of the discharge end of the nozzle, and a clamping-screw carried by one of the flanges and coöperating with the companion flange for fixing the sections in adjusted positions.

813,255. **LOCOMOTIVE-TRUCK.** WILSON B. STROUD, Pittsburg, Kans. Filed July 6, 1905. Serial No. 268,377.



Claim.—1. In a truck of the character described, a single-piece main frame comprising channel side beams composed of upright webs having longitudinally-disposed upper and lower substantially horizontal marginal flanges, and substantially L-shaped cross-bars, each consisting of an upright web and a single longitudinally-disposed substantially horizontal marginal flange.

2. In a truck of the character described, a single-piece main frame comprising channel side beams composed of upright webs having longitudinally-disposed upper and lower substantially horizontal and inwardly-extending marginal flanges leaving substantially smooth outer sides to the beams, and cross-bars connecting the side beams, each of said cross-bars being substantially L-shaped in cross-section and comprising an upright bar and a single horizontally-disposed substantially horizontal outstanding marginal flange.

3. In a truck of the character described, the combination with a main frame including a side beam having an inwardly-extending longitudinal flange, of a pedestal fitted against the under side of the beam, and fastening means for the pedestal passing therethrough and through the said inwardly-extending longitudinal flange.

4. In a truck of the character described, the combination with a main frame including a side beam having an inwardly-extending longitudinal flange, said flange having an integral pedestal depending therefrom, of detachable pedestals coöperating with the integral pedestal and fitted against the under side of the flange, and fastening-bolts for the detachable pedestals, said bolts passing through the said inwardly-extending longitudinal flange.

5. In a truck of the character described, the combination with a main frame including a side beam provided with an offset flange along its lower margin, of a pedestal fitted against the flange, and bolts engaging the pedestal and passing through the flanges for securing the pedestal to the beam.

6. In a truck of the character described, the combination with a main frame including a side beam provided with an offset flange along its lower margin, of an integral pedestal depending from the beam, another separate pedestal fitted against the flange and coöperating with the integral pedestal, and bolts engaging the latter pedestal and passing through the flange for securing said pedestal to the beam in coöperative relation to the integral pedestal.

7. In a truck of the character described, the combination with a main frame including a side channel-beam composed of an upright web and inset upper and lower flanges, of depending integral pedestals carried by the side beam, detachable pedestals located outside and coöperating with the integral pedestals, said detachable pedestals bearing against the lower side of the side beam, and means for securing the detachable pedestals to the side beam.

8. In a truck of the character described, the combination with a main frame comprising side beams provided with upper and lower inset flanges and integral end bars connecting the ends of said side beams, of depending inner pedestals carried by the side beams, detachable outer pedestals coöperating with the integral pedestals and fitted against the lower flanges of the side beams, bolts connecting the detachable pedestals and the flanges, and binders connecting the associated integral and detachable pedestals.

9. In a truck of the character described a main frame including side beams and end bars connecting the ends of the side beams and being substantially inverted-L-shaped in cross-section.

10. In a truck of the character described a single-piece main frame comprising side channel-beams and substantially L-shaped end bars connecting the same and integral therewith.

11. In a truck of the character described, a single-piece main frame comprising side beams of upright webs and offset upper and lower flanges, substantially L-shaped end bars connecting the ends of the side beams and formed integral therewith, and depending integral pedestals carried by the lower flanges of the side beams, in combination with detachable pedestals fitted against said lower flanges and coöperating respectively with said integral pedestals, and bolts for securing said pedestals and lower flanges of the side beams together.

12. In a truck of the character described, a main frame including side beams and a transom extending between the side beams, said transom comprising an upright web having offset longitudinally-disposed marginal flanges.

13. In a truck of the character described, a main frame including side beams, and a transom extending between the same, said transom comprising an upright central web, and oppositely-projecting longitudinally-disposed marginal flanges located on opposite sides of the web.

14. In a truck of the character described, a main frame including side beams and a transom extending between the same, said transom having a central bearing or female casting, upright webs located on opposite sides of the bearing or female casting and connecting the same with the side beams, said webs being provided with oppositely-projecting longitudinally-disposed marginal flanges.

15. In a truck of the character described, a main frame including channel side beams and a transom connecting the intermediate portions of the side beams and made integral therewith, said transom having a central bearing or female casting, upright webs connecting the bearing or female casting and side beams, and oppositely-projecting longitudinally-disposed upper and lower flanges located along the margins of the webs.

16. In a truck of the character described, a main frame comprising side beams, each of said side beams consisting of an upright web and inwardly-extending upper and lower marginal flanges, end bars made integral with the side beams and connecting the ends of the same, said bars consisting of angularly-disposed flanges, and a transom also integral with the side beams and located between the end bars, said transom having a central bearing, upright webs between the bearing and the side beams, and marginal flanges carried by the upper and lower portions of the webs and connecting the central bearing and said side beams.

17. In a truck of the character described, the combination with a single-piece main frame comprising side beams, end bars, and a transom, each of said elements having an upright web and offset marginal flanges, of depending pedestals carried by the side beams, certain of said pedestals being integral therewith, others being separate therefrom, bolts securing the separate pedestals to the side beams, binders connecting the lower ends of coöperating pedestals, and journal-boxes located between the pedestals.

18. In a truck of the character described, the combination with a main frame including side channel-beams, of journal-boxes mounted on the side beams, channel equalizer-bars located on opposite sides of the side beams and supported at their ends on the journal-boxes, and springs connected to the equalizer-bars and side beams.

19. In a truck of the character described, the combination with a main frame including side beams composed of upright webs and marginal flanges, of journal-boxes mounted on the side beams, equal-

inor-bars located on opposite sides of the side beams and supported at their ends on the journal-boxes, said bars also comprising upright webs and marginal flanges, spring-hangers suspended from the equalizer-bars and located between the same, and springs supported on said hangers and engaging the side beams.

20. In a truck of the character described, the combination with a single-piece main frame including channel side beams having depending integral and detachable pedestals, of journal-boxes mounted between the pedestals on the side beams, bowed equaliser channel-bars located on opposite sides of the side beams and supported at their ends on the journal-boxes, and springs associated with the equalizer-bars and side beams.

21. In a truck of the character described, the combination with a main frame including side beams, of journal-boxes mounted on the side beams, equaliser channel-bars located on opposite sides of the side beams and supported at their ends on the journal-boxes, and springs interposed between the equalizer-bars and side beams.

22. In a truck of the character described, the combination with a main frame, of journal-boxes mounted thereon, and an equalizer-bar comprising a web and offset longitudinal flanges, said bar having downturned terminals seated on the journal-boxes, and said flanges having their terminal portions tapered and terminating at the downturned ends of the bar.

23. In a truck of the character described, the combination with a main frame including a side beam, of journal-boxes mounted thereon and projecting on opposite sides of the same, and equalizer-bars located on opposite sides of the side beam and bearing on the boxes, said bars having the faces that are opposed to the beam substantially flat and having outstanding flanges on their opposite faces, which flanges taper toward their ends.

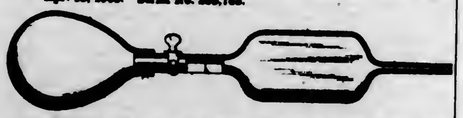
24. In a truck of the character described, an equalizer-bar tapering toward its ends and comprising a web having offset flanges.

25. In a truck of the character described, a bowed equalizer-bar having downturned ends, said bar comprising a web having upper and lower offset marginal flanges.

26. In a truck of the character described, the combination with a main frame including side beams, of pedestals carried by the side beams and having recesses in their upper portions below the side beams, shoes fitted upon the pedestals and having lugs that engage in the recesses, and binders connecting the lower ends of the pedestals and engaging the lower ends of the shoes.

27. In a truck of the character described, the combination with a main frame including a side beam, said side beam being provided with an integral pedestal depending therefrom and said pedestal having a recess in its upper portion below the side beam, of a detachable pedestal secured to the side beam and coacting with the integral pedestal, said detachable pedestal also having a recess in its upper portion, shoes fitted upon the inner opposing sides of the pedestals and having portions engaged in the recesses thereof, and a binder connecting the lower ends of the pedestals and engaging the lower ends of the shoes to retain the said portions of the shoes in the recesses.

813,256. PIPETTE. SEIJI-ICHI TAKAKI, New York, N. Y. Filed Apr. 15, 1905. Serial No. 255,723.

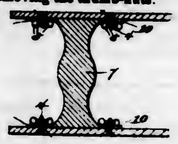


Claim.—A pipette comprising a bulb or chamber having constricted openings at its upper and lower ends, an elongated restricted inlet and discharge tube communicating with the lower end of the chamber, a relatively shorter neck of greater diameter communicating with the upper end of the chamber and provided at its lower end with a gage-mark, intermediately with seats and at its upper end with exterior retaining means, a rotary valve mounted in said seats, and a compressible bulb having a nipple fitted upon the upper end of the neck and held by the said retaining means, substantially as described.

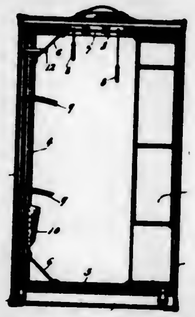
813,257. KNOCKDOWN IRONING-BOARD. ELMER E. TAHL, Mount Vernon, Ohio. Filed Feb. 23, 1905. Serial No. 246,949.

Claim.—1. A knockdown ironing-board comprising a pair of ironing-arms, a coupling-post having end flanges, each of said flanges having a pair of slots of unequal depth through the edge thereof, and screw-studs upon which the flanges are adapted to be slid under suitable nuts on the studs.

2. A knockdown ironing-board comprising a pair of ironing-arms having countersunk screw-threaded apertures, a coupling-post having a handle portion, flanges formed on the ends of the post having short and long slots to register with the apertures, the thumb-nuts, and the screw-studs fixed in the apertures and adapted to enter the slots without removing the thumb-nuts.



813,258. WARDROBE-RACK. GEORGE R. THEIS, Minneapolis, Minn. Filed Dec. 10, 1904. Serial No. 236,251.

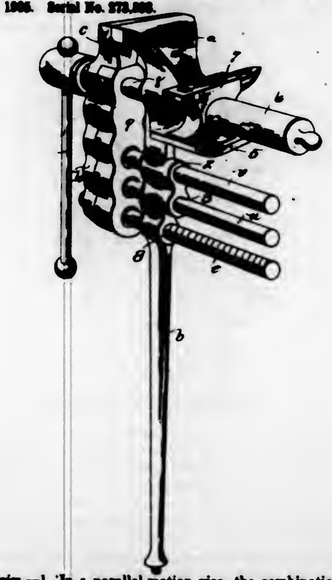


Claim.—A wardrobe-rack made up of upper and lower rectangular head-frames 3 and corner-posts 4 rigidly connecting said head-frames at their rear portions only leaving the sides and front portions of said rack between said head-frames free from obstruction, and a box removably fitting between the front portions of said head-frames and when positioned serving to prevent the forward portion of the upper head from sagging downward under the weight of the load supported by said upper head, substantially as described.

813,259. BAND-CUTTER AND FEEDER. ROBERT H. VAN COURT, Boston, Iowa. Filed June 26, 1904. Serial No. 213,707.

Claim.—In a band-cutter and feeder the combination of an upwardly-extending frame expanded at its lower end to form a flared hopper, the sides of said frame being slotted adjacent to the upper ends thereof, vertical shafts journaled on said sides adjacent to said slots and having oppositely-extending arms which are adapted to project through the slots to act as bundle-straighteners, an endless conveyer mounted in said frame and band-cutting and bundle-straightening means mounted in said frame.

813,260. VISE. THOMAS W. VARE, Philadelphia, Pa. Filed Aug. 12, 1905. Serial No. 273,698.



Claim.—1. In a parallel-motion vise, the combination with a fixed jaw and its downward extension having upper and lower threaded bearings, and intermediate guide-bearings in the same vertical plane, of a movable jaw having a downward extension, of upper and lower parallel screws pivoted in the extension of the movable jaw, a train of gear-wheels in connection with said screws, and upper and lower guide-bars between and parallel to said screws and forming journals of gear-wheels of said train, substantially as specified.

2. In a parallel-motion double-screw vise, a movable jaw having a downward extension, upper and lower parallel screws journaled in said extension, an upper cylindrical guide-bar and a lower cylindrical guide-bar between and in the plane of said screws, a train of gear-wheels connecting said screws and a detachable protecting-casing for said gear-wheels, substantially as specified.

3. A parallel-motion double-screw vise, having between and in the plane of its screws an upper cylindrical guide-bar and a lower cylindrical guide-bar and a train of gear-wheels connecting said screws and mounted on said guide-bars, substantially as specified.

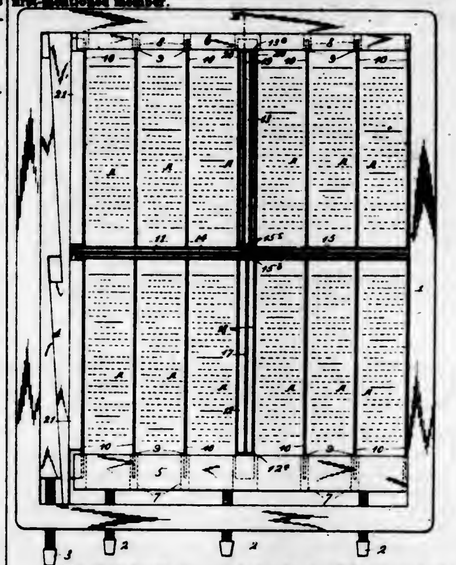
813,261. MEANS FOR PRODUCING FOLDING MATRICES. GEORGE H. VINING, Kansas City, Mo., assignor to Vining's News Bureau, Kansas City, Mo., a Corporation of Missouri. Filed Dec. 9, 1904. Serial No. 236,904.

Claim.—1. The combination with a form of type, of a member arranged in said form, and a series of ribs on said member for rendering matrices foldable.

2. The combination with a form of type, of a plurality of members suitably arranged in said form, and means on said members arranged parallel to each other for rendering matrices foldable.

3. The combination with a form of type, of a member arranged transversely therein, and longitudinal ribs on the upper central surface of said member, for rendering matrices foldable.

4. The combination with a form of type, of a member arranged transversely therein, a longitudinal rib on the upper surface of said member, a second member arranged in said form, a longitudinal rib on the upper surface of said second member abutting at one end against one side of the rib on the first-mentioned member, a third member arranged in the form in alinement with the second member, and a pair of longitudinal ribs on the upper surface of said third member abutting at their inner ends against one side of the rib on the first-mentioned member.



5. The combination with a form of type, of a member arranged transversely therein, parallel ribs on the upper surface of said member, a second member arranged in the form, abutting at one end against one side of the first-mentioned member, parallel ribs on the upper surface of said second member, a third member arranged in the form in alinement with the second member abutting at its inner end against one side of the first-mentioned member, and a plurality of parallel ribs on the upper surface of said third member.

6. The combination with a form of type, of a member arranged in said form, and a rib on said member more than type-high for rendering matrices foldable.

7. The combination with a form of type, of a grooved head-bar interposed between the type and the chase of said form, of members arranged in the form of a cross one of said members having a reduced end loosely fitting into one of the grooves of the head-bar, and ribs on the upper surfaces of said members.

8. The combination with a form of type, and an adjustable foot-bar located at one end of the form and provided with transverse grooves, a head-bar located at the opposite end of the form and provided with transverse grooves, a transverse member arranged in the form, means on said member for rendering matrices foldable, and column-rules arranged with their adjacent ends abutting against the transverse member and their opposite ends in the grooves of the foot-bar and the head-bar.

9. The combination with a form of type and a quoin located at one side thereof, of a transverse member arranged in the form, means on said member for rendering matrices foldable, and filling-strips terminating at opposite sides of the transverse member and interposed between the type and the quoin so that the latter cannot contact with the adjacent end of the transverse member.

813,262. AUTOMATIC STARTING DEVICE. HERBERT A. WARREN, FREDERICK MANER, and WILLIAM H. DENKER, Newburgh, N. Y. Filed June 20, 1905. Serial No. 266,346.

Claim.—1. In a device of the character described, the combination with a rheostat including a movable switch element, of a screw, shaft adapted to be operated from a motor, a nut adapted to traverse said shaft and to impart motion to said switch element, means for maintaining the nut in engagement with the shaft during its forward motion, means for releasing it therefrom at the end of such motion, and means for restoring the parts to their normal position.

2. In a device of the character described, the combination with a rheostat including a movable switch element, of a screw-shaft adapted to be operated from a motor, a nut adapted to traverse said

shaft, a pitman connecting the nut with the switch element, means for maintaining the nut in engagement with the shaft during its forward motion, means for releasing it therefrom at the end of such motion, and means for restoring the parts to their normal position.

3. In a device of the character described, the combination with a rheostat including a movable switch element, of a screw-shaft adapted to be operated from a motor, a nut adapted to traverse said shaft, a pitman connecting the nut with the switch element, means for maintaining the nut in engagement with the shaft during its forward motion, means for releasing it therefrom at the end of such motion, means for restoring the parts to their normal position, and means for preventing the nut from engaging the shaft during its return motion.

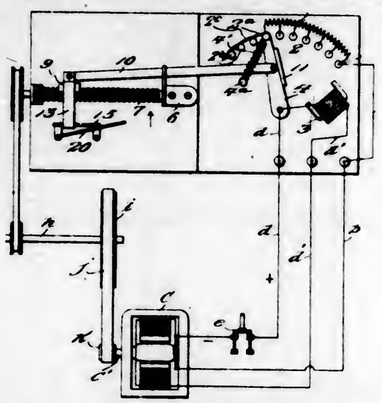
4. In a device of the character described, the combination with a rheostat including a movable switch element, of a screw-shaft adapted to be operated from a motor, a nut adapted to traverse said shaft, a pitman connecting the nut with the switch element, means for maintaining the nut in engagement with the shaft during its forward motion, means for releasing it therefrom at the end of such motion, means for restoring the parts to their normal position, and means for preventing the nut from engaging the shaft during its return motion, said means comprising a fly-felt.

5. In a device of the character described, the combination with a rheostat including a movable switch element, of a screw-shaft adapted to be operated from a motor, a nut adapted to traverse said shaft, a pitman connecting the nut with the switch element, means for maintaining the nut in engagement with the shaft during its forward motion, means for releasing it therefrom at the end of such motion, means for restoring the parts to their normal position, and means for preventing the nut from engaging the shaft during its return motion, said means comprising a fly-felt and a sleeve.

6. In a device of the character described, the combination with a rheostat including a movable switch element, of a screw-shaft adapted to be operated from a motor, a nut adapted to traverse said shaft, a pitman connecting the nut with the switch element, means for maintaining the nut in engagement with the shaft during its forward motion, means for releasing it therefrom at the end of such motion, means for restoring the parts to their normal position, and means for preventing the nut from engaging the shaft during its return motion, said means comprising a fly-felt and a sleeve, an annular strip against which the said fly-felt contacts when in raised position at which time said fly-felt contacts with said sleeve, an annular

and supported between the posts, the edges of said trays and the posts forming vertical passages in open communication with the tray-interspaces, means for circulating a heating and cooling medium through said tray-interspaces, and means for connecting said mechanism with both inlet and outlet ends of the tray-interspaces, independent heating and cooling devices located in

shaft, a pitman connecting the nut with the switch element, means for maintaining the nut in engagement with the shaft during its forward motion, means for releasing it therefrom at the end of such motion, and means for restoring the parts to their normal position.



3. In a device of the character described, the combination with a rheostat including a movable switch element, of a screw-shaft adapted to be operated from a motor, a nut adapted to traverse said shaft and impart forward movement to said switch element, means for holding the nut in engagement with the shaft during its forward movement and maintaining the same out of engagement therewith during its rearward movement, means for throwing the nut out of engagement with the shaft at the limit of its forward movement, and means for retracting or restoring the parts to their normal position.

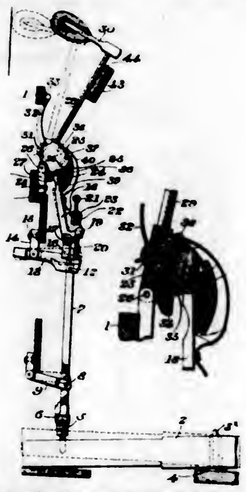
4. In a device of the character described, the combination with a rheostat including a movable switch element, of a screw-shaft adapted to be operated from a motor, a nut adapted to traverse said shaft and impart forward movement to said switch element, a shoe connected with the nut, a retaining and guiding member having opposite surfaces adapted to be traversed by said shoe to hold the nut in engagement with the shaft during its forward movement and out of engagement therewith during its rearward movement, means for shifting the shoe from the former to the latter named surface, and means for restoring the parts to their normal positions.

5. In a device of the character described, the combination with a rheostat including a movable switch element, of a screw-shaft adapted to be operated from a motor, a nut adapted to traverse said shaft and impart forward movement to said switch element, a shoe connected with the nut, a guiding and retaining member having opposite surfaces adapted to be traversed by said shoe to hold the nut in engagement therewith during its forward movement and out of engagement therewith during its rearward movement, a spring for shifting the shoe from the former to the latter named surface, and means for restoring the parts to their normal position.

813,268. **PIANO-ACTION.** EMIL WIRSUM, Philadelphia, Pa., assignor of one-third to Gustave A. Walther, Philadelphia, Pa., and one-third to Charles Schwerdfeger, Lansdale, Pa. Filed Jan. 30, 1905. Serial No. 242,188.

Claim.—1. In a device of the character described, a butt pivotally supported, a fly, a hammer-catch secured to said butt, the inner surface of which is concentric with the pivot of said butt, a strip 35 secured to said butt and having a laterally-extending portion and an upwardly-extending portion, a strip 36 extending outwardly from the upwardly-extending portion of said strip 35 and against which the top of the fly contacts during the operation, an angular piece engaging said strips, and a sleeve closely engaging said catch, said sleeve being retained thereon by the contact therewith of said catch and of the angular piece between said strips.

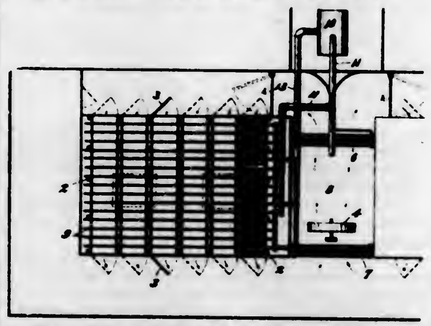
2. In a device of the character described, a butt pivotally supported, a catch secured thereto, the inner surface of which is concentric with the pivot of said butt, a sleeve adapted to closely engage said catch, a fly, a felt secured to the back of said fly near the upper end thereof, a strip secured to said butt and having a laterally-extending portion and an upwardly-extending portion, a strip extending outwardly from the upwardly-extending portion of said first strip and against which the said fly-felt contacts when in raised position at which time said fly-felt contacts with said sleeve, an angular piece engaging said strips and a stop-felt secured to said butt beneath said first strip.



3. In a device of the character described, a pivot, a butt pivotally supported thereon, a catch secured thereto, the inner surface of which is concentric with said pivot, a fly, a fly-felt near the outer end thereof, and a strip extending from said butt in a plane above the point at which said fly normally contacts, and which engages with said catch and against which the top of said fly contacts only when in raised position.

4. In a piano-action, a fly, a pivot, a butt pivotally supported thereon, a catch secured to said butt the inner surface of which is concentric with said pivot, a bridle-strip secured to said butt and adjustably attached to said fly, a hammer, means interposed between said butt and said catch against which the top of said fly contacts in raised position, and a felt on said fly, the outer surface of which is concentric with said pivot when said fly contacts with said catch whereby said hammer is frictionally held away from the string when the key is depressed.

813,264. **APPARATUS FOR DRY-CURING FISH.** VICTOR WEITMAN, San Francisco, Cal., assignor to Alaska Codfish Co., San Francisco, Cal., a Corporation. Filed Mar. 15, 1905. Serial No. 250,201.



Claim.—1. An apparatus for curing fish comprising superposed trays forming intermediate horizontal spaces for the passage of air, said trays being disposed in series side by side and having vertical ventilating-passages between the series, and means for passing alternate hot and cold currents of air intermittently through the horizontal passages.

2. In an apparatus for curing fish, vertical posts in parallel lines, parallel series of trays superposed to form horizontal passages and supported between the posts, the edges of said trays and the posts forming vertical passages in open communication with the horizontal passages, doors by which the opposite ends of the horizontal passages are controlled, an air-forcing mechanism and connection between said mechanism and the controlled passages.

3. In an apparatus for curing fish, vertically-disposed supports, trays slidable thereon and forming horizontal passages between the superposed series of trays, doors adjustable at the ends of the spaces between the trays, conduits connecting with each end of the tray series, an air-forcing mechanism, a heating-coil through which the air passes therefrom before being admitted to the drying-chambers, connections between the escape-passage and the air-forcing mechanism whereby the air may be continuously circulated through the drying-chambers, and vertical passages connecting with the interspaces between the trays.

4. In an apparatus for curing fish, horizontally-movable superposed trays forming a series of horizontal interspaces, doors located at opposite ends of these spaces and adjustable to regulate the movement of air therethrough, an air-forcing mechanism, a heating-coil through which the air is passed from said mechanism, a conduit through which the heated air is delivered to the inlet ends of the spaces between the trays, a second conduit into which the air is delivered after passing through the tray-interspaces said chamber connecting with the air-forcing mechanism, a cooling-coil so located that said air passes through the coil before again entering the air-forcing mechanism, and controlling means by which the air is intermittently subjected to a heating and a cooling process.

5. In a fish-curing apparatus, chambers consisting of a series of supports, and trays superposed thereon to form horizontal passages between the trays, controlling and regulating doors at each end of said chambers, an air-forcing mechanism, a heating-coil through which the air is passed, a conduit conducting the air to the inlet ends of the curing-chambers, a receiving-conduit at the opposite end of said chambers, said conduit connecting with the air-forcing mechanism, a cooling-coil located anterior to the air-forcing mechanism and vertically-disposed ventilating-passages between the parallel and successive series of trays and their supports whereby both a horizontal and vertical circulation of air may be effected.

6. In a fish-curing apparatus, a chamber having successive series of horizontally-disposed trays superposed to form horizontal passages, means for heating and circulating air through said passages, an independent series of heating-pipes passing through the space between the trays and operating in conjunction with the air-currents, a boiler, pipes leading therefrom to supply the circulating system, and other pipes with which said system connects and by which the heating medium is returned to the boiler.

7. In a fish-curing apparatus, a plurality of chambers, each composed of vertically-disposed studding with rails upon each side, trays adapted to contain fish, and fitting and slidable upon said rails so as to form substantially independent superposed series of air-spaces upon each side of the vertical posts, vertically-disposed ventilating-openings between said posts connecting with each of the horizontal air-passages, heating-pipes extending transversely through one horizontal passage, and returning through the next contiguous one, connections by which a heating medium is supplied from and returned to a heater, an air-forcing mechanism, a heating-coil through which the air is passed from said mechanism, a conduit extending from said coil and connecting with each of the successive series of horizontal passages, doors at opposite ends of the passages, whereby the inlet and outlet of the air and its horizontal and vertical circulation may be controlled, a conduit into which the air discharged from between the horizontal trays is admitted, said conduit connecting with the inlet side of the air-forcing mechanism, and a refrigerating-coil, through which the air passes before reaching the said mechanism.

8. An apparatus having in circuit a drying-chamber consisting of superposed trays forming horizontal passages between them, means to discharge the heated air vertically from the spaces between the trays, means to alternately circulate bodies of cool and heated air horizontally through said spaces, and means to regulate the air-supply passing between the trays.

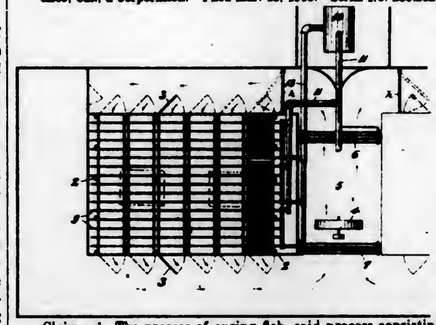
9. An apparatus for curing fish, having in circuit superposed series of trays forming horizontal passages between them, an air-forcing mechanism and conduits connecting said mechanism with both inlet and outlet ends of the passages, independent heating and cooling devices located in the circuit, and means for controlling the alternate flow of heated and cooled air through the apparatus.

10. An apparatus for curing fish, having in circuit a plurality of parallel and superposed series of trays forming horizontal passages between each series of trays, an air-forcing mechanism and conduits connecting said mechanism with both inlet and outlet ends of the tray-interspaces, independent heating and cooling devices located in the circuit, means for controlling the flow of air through the apparatus, and vertical conduits between the superposed series with open communication with the tray-interspaces.

11. An apparatus for curing fish having a plurality of vertical independent circuits each including parallel and superposed series of trays forming horizontal interspaces, an air-forcing mechanism, and independent heating and cooling devices located in that portion of the circuit common to both series of trays, conduits and gates whereby the flow from the air-forcing mechanism may be diverted to one series and cut off from the other, and means for regulating the flow through either series.

12. An apparatus for curing fish having in circuit parallel and superposed series of trays forming horizontal passages between the superposed trays, an air-forcing mechanism and conduits connecting said mechanism with both inlet and outlet ends of the tray-interspaces, independent heating and cooling devices located in the circuit with means for controlling the flow through the apparatus, independent heating-pipes located in the tray-interspaces and vertical conduits connecting with said interspaces.

813,265. **PROCESS OF DRY-CURING FISH.** VICTOR WEITMAN, San Francisco, Cal., assignor to Alaska Codfish Company, San Francisco, Cal., a Corporation. Filed Mar. 15, 1905. Serial No. 250,202.



Claim.—1. The process of curing fish, said process consisting in first applying radiant heat between separated layers of fish, and subsequently subjecting the fish to alternate hot and cool air-currents by circulating alternately cooled and heated air through the interspaces between the supported fish.

2. The process of curing fish, said process consisting in first warming the fish by radiant heat between the fish, then allowing the warm air to escape and subjecting the fish to alternate hot and cool air-currents by circulating currents of alternately cooled and heated air above and below the superposed fish-supports.

3. The process of curing fish, said process consisting in first warming the fish by radiant heat applied between superposed and separated layers thereof, withdrawing the body of warm air and then circulating a current of heated air between the fish-trays, cooling the air, and again circulating said cooled air between the layers of fish.

4. The process of curing fish, said process consisting in first warming the fish by radiant heat applied between separated trays of fish, then circulating a body of air through the spaces between the fish, and subjecting the fish to alternate hot and cool air-currents by heating said air, and then cooling it between the periods of heating.

813,266. **BAG-FASTENER.** JOHN S. WILLIAMSON, Elizabethtown, N. C. Filed Aug. 4, 1905. Serial No. 272,717.

Claim.—1. A bag-fastener comprising a wire having a pointed end and having its opposite end portion bent to form a portion extending at an acute angle to the main portion, the free end of this said angular portion being bent inwardly at an acute angle to the remainder of said angular portion and having its free extremity sharpened.

2. The combination with a bag, of a fastener therefor comprising a wire engaged through the sides of the bag and then over the free edges thereof and then through the bag throughout the entire width of the latter, the end portions of the wire being bent toward each other at opposite sides of the bag and then being passed through

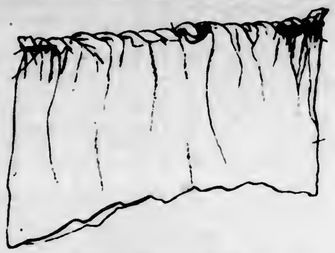
the bag, the extremities of said end portions being bent away from each other against the bag and lying at opposite sides thereof.

3. In combination with a door and frame therefor, a casing upon the door, a weather-strip within said casing, angled levers pivotally mounted within the casing, pivotal link connections between

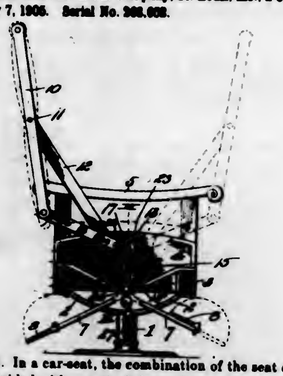
813,269. **GALVANOMETER.** PHILIP H. WYNNE, Boston, Mass., assignor, by direct and mesne assignments, of one-half to Agnes Wynne and one-half to J. H. Pratt, Assignee, Somerville, Mass. Filed Dec. 15, 1904. Serial No. 236,997.

magnet sustained between said supports, a coil suspended in the field of the magnet, brackets carried by the supports, rods adjustably

the bag, the extremities of said end portions being bent away from each other against the bag and lying at opposite sides thereof.



813,267. REVERSIBLE CAR-SEAT. HUBERT WITTE, St. Louis, Mo., assignor to St. Louis Car Company, St. Louis, Mo., a Corporation. Filed July 7, 1905. Serial No. 268,028.



Claim.—1. In a car-seat, the combination of the seat ends, one of which is provided with a vertical slot; a dog positioned in said slot and pivoted to said seat end and having a finger at its upper end and a weighted lower end; a pair of back-supporting arms rockingly supported by said seat ends and one of which is provided with a stud adapted to engage the finger of said dog, and a back supported by said arms, substantially as set forth.

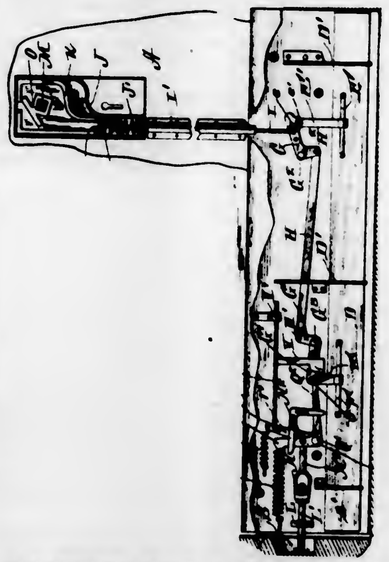
2. In a car-seat, the combination of the seat ends provided with studs, a pair of back-supporting arms rockingly supported by said seat ends and provided with slots to receive said studs, a back supported by said arms, and restraining-links pivoted to said arms intermediate of their ends and provided at their inner ends with T-shaped slots to receive the studs of said seat ends and having their outer ends loosely connected to said back, substantially as set forth.

813,268. WEATHER-STRIP. LEWIS W. WOODBURN, Charleston, Ill. Filed July 31, 1905. Serial No. 272,066.

Claim.—1. In combination with a door and frame therefor, a casing upon the door, a weather-strip within said casing, angled levers pivotally mounted within the casing, pivotal link connections between said angled levers and weather-strip, a bar connecting said angled levers, a knob-shaft, means actuated thereby for tilting one of said angled levers, a spring-actuated angled lever coöperating with the mechanism actuated by the knob-shaft for partially counterbalancing the weather-strip, means for holding the weather-strip in a raised position, said spring-actuated lever adapted to release the weather-strip-holding means as the door is closed, as set forth.

2. In combination with a door and frame therefor, a casing upon the door, a weather-strip within said casing, angled levers pivotally mounted within the casing, pivotal link connections between said angled levers and weather-strip, a bar connecting said angled levers, a yoke, a knob-shaft and means actuated thereby for raising said yoke, a rod connecting said yoke with one of said angled levers, a spring bearing yieldingly against said yoke, a spring-actuated angled lever coöperating with said rod to partially counterbalance said weather-strip, means for holding the weather-strip in a raised position, and mechanism for operating said spring-actuated lever, whereby the latter may cause said holding means to be released to allow the weather-strip to fall as the door is closed, as set forth.

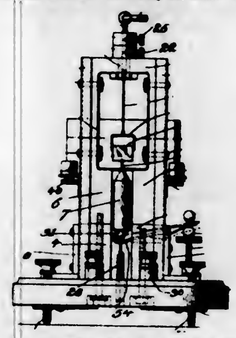
3. In combination with a door and frame therefor, a casing upon the door, a weather-strip within said casing, angled levers pivotally mounted within the casing, pivotal link connections between said angled levers and weather-strip, a bar connecting said angled levers, a knob-shaft, a yoke, means carried by said shaft for raising said yoke, a casing in which said yoke is mounted, a spring bearing between said casing and the yoke, a rod passing through the yoke and connected to one of said angled levers, a pivotal spring-actuated angled lever adapted to coöperate with said rod to partially counterbalance the weather-strip, a lug upon one of said angled levers, spring-actuated means for engagement with said lug whereby the weather-strip may be held in a raised position, and a rod for operating said spring-actuated angle-lever, whereby the latter may cause said holding means to be released to allow the weather-strip to fall as the door is closed, as set forth.



4. In combination with a door and frame therefor, a casing upon the door, a weather-strip within said casing, angled levers pivotally mounted within the casing, pivotal link connections between said angled levers and weather-strip, a bar connecting said angled levers, a knob-shaft, a yoke, means carried by said shaft for raising said yoke, a casing in which said yoke is mounted, a spring bearing between said casing and the yoke, a rod passing through the yoke, and connected to one of said angled levers, a spring-actuated angled lever mounted in the casing, coöperating with said rod to partially counterbalance said weather-strip a lug *g* upon one of said angled levers adapted to be engaged by an arm of said spring-actuated lever, a lug G^4 upon one of said angled levers, a longitudinally-movable rod W, a depending angled arm thereon adapted to engage said lug G^4, a spring-actuated pivotal lever T connected to said rod W, and a lug *t* upon said lever T, and against which the spring-actuated angled lever is adapted to contact, whereby the rod W may be moved longitudinally and the depending angled arm thereof released from the lug upon the angled lever as the door is closed, as set forth.

5. In combination with a door and frame therefor, a casing upon the door, a weather-strip within said casing, angled levers pivotally mounted within the casing, pivotal link connections between said angled levers and weather-strip, a bar connecting said angled levers, a lug upon one of said angled levers, a longitudinally-movable rod, an angled arm thereon adapted to engage said lug, a spring-actuated lever connected to said rod, a lug upon said spring-actuated lever, a pivotal spring-actuated angled lever, knob-actuating mechanism coöperating with the latter to partially counterbalance said weather-strip, a bolt secured to said spring-actuated angled lever, and a plate against which the end of the bolt is adapted to contact as the door is closed, whereby the bolt may be moved longitudinally and said angled arm released from the lug upon the angled lever, to allow the weather-strip to fall, as set forth.

813,269. GALVANOMETER. PHILIP H. WYNNE, Boston, Mass., assignor, by direct and mesne assignments, of one-half to Agnes Wynne and one-half to L. H. Knott Apparatus Company, Boston, Mass., a Corporation of Massachusetts. Filed July 14, 1905. Serial No. 269,940.



Claim.—1. In a galvanometer, an inverted horseshoe-magnet, stilts or struts of non-magnetic material on which said magnet is supported, and a coil suspended between the poles of the magnet to swing about a vertical axis.

2. In a galvanometer, a base or table, stilts of non-magnetic material rising therefrom, a horseshoe-magnet with parallel pole-pieces resting on said stilts, and a vertical coil suspended between said parallel pole-pieces.

3. In a galvanometer, a base, stilts of non-magnetic material rising therefrom, a horseshoe-magnet resting on said stilts, a coil suspended between the poles of said magnet, and transparent plates resting against the magnet and forming with the magnet an inclosing case for the coil

4. In a galvanometer, a base, non-magnetic stilts rising therefrom, a horseshoe-magnet arranged with its pole-pieces resting on said stilts, a coil suspended between said pole-pieces, and supports secured to the base and the sides of the magnet for holding the magnet in position.

5. In a galvanometer, a base, non-magnetic stilts rising therefrom, a horseshoe-magnet arranged with its pole-pieces resting on said stilts, a coil suspended between said pole-pieces, and channel-shaped supports rigid with the base and embracing the sides of the magnet and holding the latter in position.

6. In a galvanometer, a base, non-magnetic stilts rising therefrom, a horseshoe-magnet arranged with its pole-pieces resting on said stilts, a coil suspended between said pole-pieces, channel-shaped supports rigid with the base and embracing the sides of the magnet and holding the latter in position, and transparent plates overlying the magnet and clamped thereto by the channel-shaped supports.

7. In a galvanometer, a base, channel-shaped supports rising from the base, an inverted horseshoe-magnet between said supports and sustained thereby, and a suspended coil in the field of the magnet.

8. In a galvanometer, a base, supports rising therefrom, an inverted horseshoe-magnet between said supports and sustained thereby, a non-magnetic distance-piece between the magnet and base, and a coil suspended in the field of the magnet.

9. In a galvanometer, a base, channel-shaped supports rising therefrom, an inverted horseshoe-magnet between said supports and sustained thereby, and transparent plates overlying the magnet and clamped thereto by the channel-shaped supports.

10. In a galvanometer, a base, supports rising therefrom, a magnet held in position by said supports, a suspended coil between the pole-pieces of the magnet, brackets secured to said supports, and a reading device adjustably mounted on said brackets.

11. In a galvanometer, a base, supports rising therefrom, a magnet held in position between said supports, a suspended coil between the pole-pieces of the magnet, brackets sustained by the supports, and a reading device adjustably mounted on the brackets for movement transversely of the magnet.

12. In a galvanometer, a base, supports rising therefrom, a magnet between said supports and held in position thereby, a coil suspended between the pole-pieces of the magnet, brackets extending from the supports, a supporting-rod adjustably clamped to each bracket, and plates carrying a scale and a fiducial mark respectively, sustained by said supporting-rods.

13. In a galvanometer, a base, supports rising therefrom, a magnet sustained between said supports, a coil suspended in the field of the magnet, brackets carried by the supports, rods adjustably clamped to the bracket and capable of a lateral swinging and a longitudinal movement, and plates carrying a scale and a fiducial mark respectively, sustained by said rods.

14. In a galvanometer, a base, supports rising therefrom, a magnet sustained by said supports, a coil suspended in the field of the magnet, brackets carried by the supports, a slotted clamping-screw carried by each bracket, a rod passing through the slot of each clamping-screw, and plates carrying a scale and fiducial mark respectively sustained by said rods.

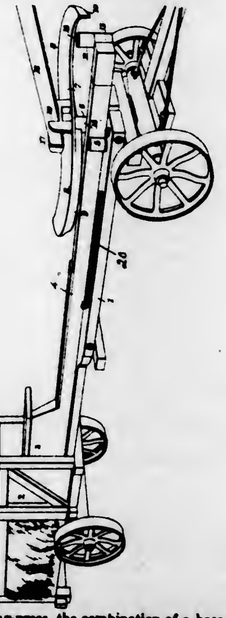
15. In a galvanometer, a pair of supports, a magnet sustained thereby, a bracket carried by each support, a horizontal rod adjustably clamped to each bracket, and plates carrying a scale and fiducial mark respectively, pivotally connected to the rods at their ends.

16. In a galvanometer, a base, supports rising therefrom, a magnet arranged between and sustained by said supports, a coil suspended between the poles of the magnet, and a clamping-lever pivoted to one of the supports and adapted to engage the coil to clamp it in inoperative position.

17. In a galvanometer, a base, supports rising therefrom, an inverted magnet between said supports and sustained thereby, a coil suspended between the pole-pieces of the magnet, a protecting-shell inclosing the coil, and means to immovably clamp said shell in inoperative position.

18. In a galvanometer, a base, a magnet supported thereby, a coil operated by the magnet, leveling-screws screw-threaded through the base, and friction members separate from the base and through which the leveling-screws pass, said friction members being adjustable with relation to the base, thereby to take up lost motion.

813,270. BALING-PRESS. THOMAS ABBOT and HARRY B. ABBOT, Terrell, Tex. Filed Oct. 30, 1899. Renewed Apr. 9, 1903. Serial No. 151,919.



Claim.—In a baling-press, the combination of a base, a baling box or chamber fixed thereon, a plunger movable in said box or chamber and having a beam, a tractile spring connected at its rear end to the plunger-beam, and at its forward end to the base at one side of the beam, an antifriction-roller mounted on the base at the same side of the beam and arranged to be engaged by said beam, an antifriction-roller carried by the beam and located above the beam and at the forward corner thereof remote from the spring and the first-mentioned antifriction-roller, a journal rising from the base at the opposite side of the beam, with reference to the spring and the

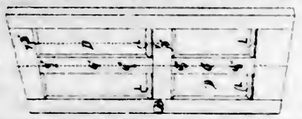
first-mentioned antifriction-roller, a rotary casting mounted on said journal and having depending cam-flanges arranged to engage the impulses, and the other roll having opposed to and coacting with the spirally-ridged part of the first roll, a periphery unbroken by

813,275. RADIATOR. ISAAC BROOKE, Pottstown, Pa., assignor to The Floyd-Wells Company, Royersford, Pa., a Corporation of Penn-

the top of the jar, and gaskets arranged between said plate and jar and between said thumb-screw and plate, substantially as described.

first-mentioned antifriction-roller, a rotary casting mounted on said journal and having depending cam-flanges arranged to engage the antifriction-roller on the beam, and a sweep for rotating the said casting.

813,271. COMBINED STORM AND SCREEN DOOR. JOHN ARMIN, Joliet, Ill. Filed May 14, 1904. Serial No. 207,995.



Claim.—1. In a combined storm and screen door, in combination, a frame having openings with moldings at top and bottom thereof, interchangeable panels adapted to fit said openings, and mullions detached from frame and panels adapted to fit the moldings at the top and bottom of said openings and to secure said panels in said openings, substantially as described.

2. In a combined storm and screen door, in combination, a frame having panel-openings, interchangeable panels adapted to fill said openings, a molding L^1 on said panels and moldings E, E' on said frame providing a weather-tight joint between the bottom of said panels and said frame, and means J whereby said panels are secured in said openings, substantially as described.

3. In a combination storm and screen door, a frame composed of stiles, rails and base only, having openings D, in combination with panels F, detached mullions G, and bolts J passing through said mullions and said panels and adapted to secure both mullions and panels in said frame, substantially as described.

4. In a combination storm and screen door, in combination, a frame, interchangeable panels, a molding E, E', on the top of each rail of said frame, a molding L on the bottom of each of said panels adapted to closely engage said moldings E, E', substantially as described.

813,272. PROCESS OF MAKING SILK FIBROIN PEPTONE. JULIUS ALTSCHUL, Berlin, Germany, assignor to Action-Gesellschaft für Anilin Fabrikation, Berlin, Germany. Filed Oct. 14, 1905. Serial No. 283,047.

Claim.—1. A process for the manufacture of silk fibroin peptone which consists in treating silk fibroin with a mineral acid which forms insoluble salts with alkaline-earth metals until addition of alcohol to a sample causes only a slight precipitate, neutralizing the acid by converting it into an insoluble alkaline-earth salt, filtering and evaporating the filtrate to dryness.

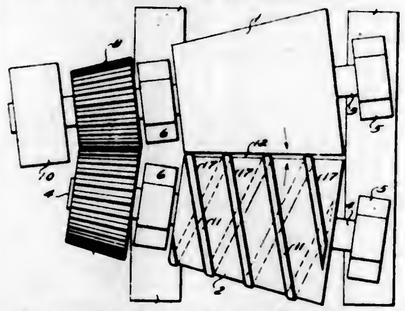
2. A process for the manufacture of silk fibroin peptone which consists in treating silk fibroin with strong sulfuric acid until addition of alcohol to a sample causes only a slight precipitate, neutralizing the acid by converting it into an alkaline-earth salt, filtering and evaporating the filtrate to dryness.

3. A process for the manufacture of silk fibroin peptone which consists in introducing silk fibroin into several times its weight of sulfuric acid of eighty per cent. strength, allowing the mixture to remain at a temperature between 0° centigrade and 25° centigrade until the addition of alcohol to a sample causes only a slight precipitate, adding an alkaline-earth carbonate in quantity sufficient to neutralize the acid, filtering and evaporating the filtrate to dryness at a low temperature.

4. A process for the manufacture of silk fibroin peptone which consists in introducing silk fibroin into several times its weight of sulfuric acid of eighty per cent. strength, allowing the mixture to remain at a temperature between 0° and 25° centigrade until the addition of alcohol to a sample causes only a slight precipitate, adding an alkaline-earth carbonate in quantity sufficient to neutralize the acid, filtering and evaporating the filtrate to dryness at a low temperature, redissolving the residue in a solvent that does not dissolve the inorganic salts, filtering the solution, and evaporating it to dryness at a low temperature.

813,273. BRICK-CLAY-CRUSHER ROLLS. JULIUS H. BACH, Chicago, Ill. Filed Feb. 6, 1903. Serial No. 142,181.

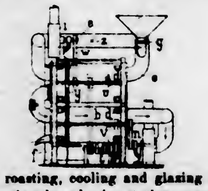
Claim.—1. An apparatus for crushing clay and removing the stones therefrom, comprising a supporting-frame; a pair of coacting crusher-rolls, one of same having a ridge extending spirally around and along its periphery, the width of the space between adjacent spires of said ridge being considerably greater than the height of the ridge, whereby said ridge is adapted to eject stones by discontinuous impulses, and the other roll having opposed to and coacting with the spirally-ridged part of the first roll, a periphery unbroken by ridges or depressions; and means for simultaneously revolving said rolls; one of said rolls being geared to revolve at different peripheral speeds than the other, substantially as described.



2. An apparatus for crushing clay and removing the stones therefrom, comprising a supporting-frame; a pair of coacting crusher-rolls, one of same having a ridge extending spirally around and along its periphery, the width of the space betwen adjacent spires of said ridge being considerably greater than the height of the ridge, whereby said ridge is adapted to eject stones by discontinuous impulses, and the other roll having opposed to and coacting with the spirally-ridged part of the first roll, a periphery unbroken by ridges or depressions; and means for simultaneously revolving said rolls; one of said rolls being conical and geared to revolve at different peripheral speeds than the other, substantially as described.

3. An apparatus for crushing clay and removing the stones therefrom, comprising a supporting-frame; a pair of conical coacting crusher-rolls, one of same having a ridge extending spirally around and along its periphery, the width of the space between adjacent spires of said ridge being considerably greater than the height of the ridge, whereby said ridge is adapted to eject stones by discontinuous impulses, and the other roll having opposed to and coacting with the spirally-ridged part of the first roll, a periphery unbroken by ridges or depressions; and means for simultaneously revolving said rolls, one of said rolls being geared to revolve at different peripheral speeds than the other, substantially as described.

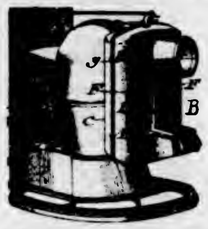
813,274. ROASTING APPARATUS FOR COFFEE, MALT, &c. MICHEL BOOP, Strassburg, Germany. Filed May 31, 1905. Serial No. 263,189.



Claim.—1. A roasting, cooling and glazing apparatus, comprising a rotary roasting-drum having stationary ends, a rotary cooling and glazing drum located below said roasting-drum and having stationary ends, means for heating the said roasting-drum connected by piping with both ends of the latter, a ventilator communicating with the piping, dampers controlling the passage of air and hot gases through said piping, a pipe, presenting a perforated portion, connecting the one end of each of the two drums, and an exhauster communicating with the other end of said glazing-drum, substantially as set forth.

2. A roasting, cooling and glazing apparatus, comprising a roasting-drum and a cooling and glazing drum located below said roasting-drum, each drum having stationary ends and a rotary body, means to revolve said drums, means for heating said roasting-drum, connected by piping with both ends of the said roasting-drum, a ventilator communicating with the said piping, dampers controlling the passage of air and hot gases through said piping, a pipe presenting a perforated portion, connecting the one end of each of the two drums, an exhauster communicating with the other end of said glazing-drum, and means for driving the two said drums both in conjunction or independently of each other, substantially as set forth.

813,275. RADIATOR. ISAAC BROOKE, Pottstown, Pa., assignor to The Floyd-Wells Company, Royersford, Pa., a Corporation of Pennsylvania. Filed Mar. 31, 1905. Serial No. 253,083.



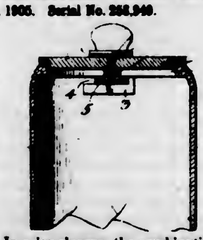
Claim.—1. A radiator attachment for a furnace formed of a body of separate chambered sections, the latter being provided with inturned walls on the interior thereof, the inner terminals of said walls being closely in contact forming side and central flues which are in communication at the lower end of said body, the latter having an inlet in communication with the side flues and an outlet in communication with the central flue.

2. A radiator attachment for a furnace composed of a body formed of separate chambered sections, the latter being provided with inturned walls on the interior thereof, the inner ends of said walls being closely in contact forming side and central flues, an inlet on said body in communication with the side flues, an outlet on said body in communication with the central flue, the top of the central flue having means for partially closing the same, and a damper above said means intermediate of said inlet and outlet.

3. A radiator attachment for a furnace composed of a body formed of chambered sections and having an inlet and outlet, said sections being provided with inturned walls on the interior thereof, the inner sides of said walls being closely in contact forming central and side flues in said body, the side flues being in communication at their tops with said inlet and at the bottom thereof with the central flue and the terminal of the latter-named flue being in communication with said outlet.

4. A radiator composed of a body formed of sections, the interior of the sections having inturned walls, the same being in contact forming central and side flues and an inlet and outlet on said body, the side flues being in communication at their tops with said inlet and at the bottom thereof with the central flue and the terminal of the latter-named flue being in communication with said outlet.

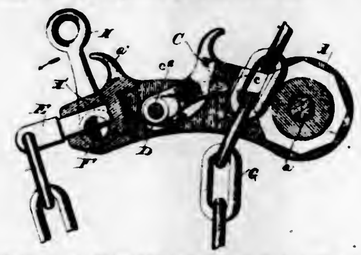
813,276. JAR-CLOSURE. FRANKLIN G. BURLEY, Boston, Mass. Filed May 5, 1905. Serial No. 258,940.



Claim.—1. In a jar-closure, the combination with the body of the jar having an inwardly-projecting annular flange formed around the mouth of the same, radially-disposed brackets arranged on the inner wall of said body below said flange, a spider frame supported on said brackets and adapted to engage beneath said flange, a flanged cover-plate arranged on said jar, and means to connect said plate and spider and to clamp said cover-plate into air-tight engagement with the top of the jar, substantially as described.

2. In a jar-closure, the combination with the body of the jar having an inwardly-projecting annular flange formed around the mouth of the same, radially-disposed brackets arranged on the inner wall of said jar, a spider frame the arms of which are adapted to engage said brackets beneath said annular flange, a concentrically-disposed, hollow, interiorly-threaded boss formed on said spider, a flanged cover-plate arranged on said jar, said plate being provided with a concentrically-disposed opening, a thumb-screw adapted to be passed through said opening and screwed into said threaded boss thereby clamping said cover-plate into air-tight engagement with the top of the jar, and gaskets arranged between said plate and jar and between said thumb-screw and plate, substantially as described.

813,277. CHAIN SLING AND TRIP. WILLIAM E. CAGE, Hobson Solms, La. Filed Aug. 17, 1905. Serial No. 274,530.



Claim.—1. A sling and trip comprising a frame having a socket in one end, a longitudinally-movable locking-bolt having a notched end fitting in said socket, a transverse and rotary adjustable locking-pin having its middle portion formed to enter or withdraw from the notch by a rotary action, a flexible connection secured to the locking-bolt, and a take-up grab at the other end of the frame for the other end of the flexible connection.

2. A chain sling and trip comprising a frame having a socket in one end, a longitudinally-moving locking-bolt having a notched end fitting in said socket, a transverse and rotary adjustable locking-pin having its middle portion formed to enter or withdraw from the notch by a rotary action, a chain secured to the locking-bolt, and a chain-grab at the other end of the frame consisting of a wheel with two polygonal flanges with a groove between them and a pivoted detent having two jaws at its free end bearing against the polygonal faces of the wheel and lying upon opposite sides of the groove of said wheel.

3. A chain sling and trip, comprising a two-sided frame, a wheel pivoted between the sides and having two polygonal flanges with a groove between them, a detent pivoted between the two sides of the frame and having two jaws resting upon the polygonal faces of the wheel-flanges and a locking and tripping device at the other end of the frame.

4. A chain sling and trip, comprising a two-sided frame, a wheel pivoted between the sides and having two polygonal flanges with a groove between them, a detent pivoted between the sides of the frame and having two jaws resting upon the polygonal faces of the wheel-flanges, a spring arranged in the frame and bearing against the detent to hold it upon the wheel and a locking and tripping device at the other end of the frame.

5. A chain sling and trip, comprising a two-sided frame, a chain-grab device arranged between the two sides of the frame at one end, a chain, a longitudinally-sliding locking-bolt attached to said chain and entering the end of the frame, a transverse locking-pin for the bolt and a trip-arm on the end of the locking-pin.

6. A chain sling and trip, comprising a frame bifurcated at one end and made integral at the other end with an end socket, a grooved and polygonal flanged wheel and a pivoted and double-jawed detent arranged between the sides of the bifurcated frame, a spring for the detent, a longitudinally-sliding and notched locking-bolt fitting the end socket of the frame, a transverse locking-pin with trip-arm on its end and a chain connected to the locking-bolt and adjustably secured by the detent and wheel.

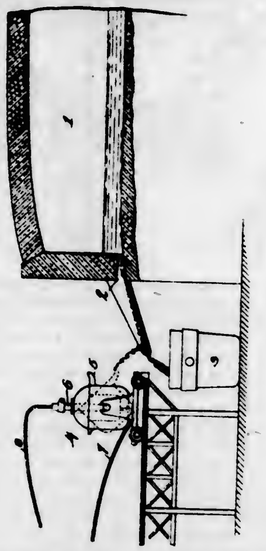
813,278. PROCESS OF COMBINING TITANIUM WITH OTHER METALS. FERDINAND B. CANDA, New York, N. Y., assignor to Chrome Steel Works, Chrome, N. J., a Corporation of New Jersey. Filed Jan. 26, 1905. Serial No. 243,680.

Claim.—1. The herein-described process of combining titanium with other metals, which consists in melting separately titanium-bearing material and the metal to which the same is to be added, and then uniting the two molten substances.

2. The herein-described process of combining titanium with iron or steel, which consists in melting separately ferrotitanium and the iron or steel, and then uniting the two bodies of molten metal.

3. The herein-described process of combining titanium with iron or steel, which consists in melting a titanium-bearing material by the action of an electric current and then adding such molten material to a mass of separately-melted iron or steel.

4. The herein-described process of combining titanium with iron or steel, which consists in melting ferrotitanium by the action of an electric current and then adding such molten material to a mass of separately-melted iron or steel.



5. The herein-described process of combining titanium with iron or steel, which consists in melting separately the titanium-bearing material and the metal to which the same is to be added, and then pouring the molten substances simultaneously into a suitable receptacle.

6. The herein-described process of combining titanium with iron or steel, which consists in melting separately the titanium-bearing material and the metal to which the same is to be added, and then pouring the molten substances simultaneously into a suitable receptacle and causing the streams of the two molten substances to join.

818,279. PRINTING-PRESS ATTACHMENT. CHARLES R. CLARK, Homestead, Pa. Filed Feb. 1, 1904. Serial No. 191,612.

Claim.—1. In a printing and crimping machine, the combination with a printing-drum, and a fly, of a crimping device interposed between the fly and drum adapted to crimp the material previously acted upon by the drum as it passes from the drum to the fly.

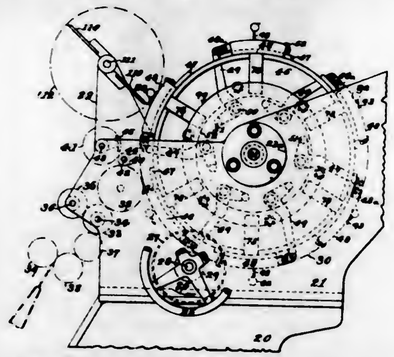
2. In a printing and crimping machine, the combination with a printing-drum, of a crimping device adjacent thereto adapted to directly receive the material as it passes from the drum.

3. In a printing and crimping machine, the combination with a printing-drum, of a crimping device arranged adjacent thereto adapted to directly receive the material as it passes from the drum, and means for conveying away the material after it is acted upon by the crimping device.

4. In a printing and crimping machine, the combination with a printing-drum, of a crimping device arranged adjacent to said printing-drum adapted to directly receive the material acted upon by the drum and crimp it, a conveyer adapted to carry the crimped material from the crimping device, and a fly adapted to receive the material from the conveyer.

5. In a printing and crimping machine, the combination with a printing-drum, a crimping device arranged adjacent to said drum, and means permitting the material acted upon by the drum to pass thereround and then direct said material to the crimping device.

818,280. PAPER-BAG MACHINE. EDWARD E. CLAFLIN, Hartford, Conn., assignor to Union Paper Bag Machine Company, Philadelphia, Pa. Filed May 20, 1905. Serial No. 261,202.



Claim.—1. In combination the cylinder, the carriage mounted on the cylinder, means for reciprocating the carriage in and against the direction of the rotation of the cylinder, and means for clamping the lower ply of a bag-blank to the carriage substantially as described and set forth.

2. In combination the continuous revolving cylinder, the carriage mounted on the cylinder, means for reciprocating the carriage in the direction of the rotation of the cylinder, the side clips and the front clip mounted on the carriage substantially as described.

3. In combination the continuous revolving cylinder, the annular segmental-shaped carriage, means for reciprocating the carriage, the annular segmental-shaped guides on the circumference of the cylinder, the side clips and the front clip mounted on the carriage, all substantially as described for the purpose set forth.

4. In a paper-bag machine the combination of the cylinder, the carriage mounted on the cylinder, means for reciprocating the carriage on the cylinder, means for clamping the lower ply of the tube to the carriage, means for clamping the upper ply of the tube and means for tucking under a portion of the upper ply, all substantially as described.

5. In a paper-bag machine the combination of the revolving cylinder, the carriage mounted on the cylinder, the cam 52 and the intermediate mechanism for reciprocating the carriage in the direction of the rotation of the cylinder, means for holding the lower ply of the tube to the carriage, consisting of the front clip and the oppositely-disposed bevel-edged side clips, the oppositely-disposed tuck-blades, side nippers for holding the upper ply of the tube to the tuck-blades, all combined and operating to unfold the tube while the cylinder revolves and the carriage is oscillated forward in the direction of the rotation of the cylinder.

6. In a paper-bag machine the combination of the revolving cylinder, the carriage mounted on the cylinder, the cam 52 and intermediate mechanism for reciprocating the carriage, the front clip and the oppositely-disposed bevel-edged side clips, means for opening and closing the front clip and the side clips at predetermined positions, the oppositely-disposed tuck-blades, side nippers for holding the upper ply of the tube to the tuck-blades, all mounted on the cylinder and revolving therewith to unfold the paper tube and tuck under a portion of the upper ply and collapse the same into the diamond form while the cylinder revolves and the carriage is oscillated forward in the direction of the rotation of the cylinder.

7. In a paper-bag machine the combination of the revolving cylinder, the carriage mounted on the cylinder, the cam 52 and the intermediate mechanism for reciprocating the carriage, means for holding the lower ply of the tube to the carriage, consisting of the front clip and the oppositely-disposed bevel-edged side clips, the oppositely-disposed tuck-blades, means for moving the tuck-blades into and out of operating positions, side nippers for holding the upper ply of the tube to the tuck-blades, all combined and operating to unfold the tube and tuck under a portion of the upper ply and collapse the same into the diamond form while the cylinder revolves and the carriage is oscillated forward in the direction of the rotation of the cylinder.

8. In a paper-bag machine the combination of the revolving cylinder, the carriage mounted on the cylinder, the cam 52 and the intermediate mechanism for reciprocating the carriage, means for

holding the lower ply of the tube to the carriage, consisting of the front clip and the two side clips, the oppositely-disposed tuck-blades, means for moving the tuck-blades into and out of operating positions, means for raising and lowering the tuck-blades away from and toward the top surface of the carriage, side nippers for holding the upper ply of the tube to the tuck-blades, all combined and operating to unfold the tube and tuck under a portion of the upper ply and collapse the same into the diamond form while the cylinder revolves and the carriage is oscillated forward in the direction of the rotation of the cylinder.

9. In a paper-bag machine the combination of the revolving cylinder, the carriage mounted on the cylinder, the cam 52 and the intermediate mechanism for reciprocating the carriage, means for holding the lower ply of the tube to the carriage, consisting of the front clip and the two side clips, the oppositely-disposed tuck-blades, means for moving the tuck-blades into and out of operating positions, means for raising and lowering the tuck-blades away from and toward the top surface of the carriage, means for oscillating the tuck-blades about their shafts, side nippers for holding the upper ply of the tube to the tuck-blades, all combined and operating to unfold the tube and tuck under a portion of the upper ply and collapse the same into the diamond form, while the cylinder revolves and the carriage is oscillated forward in the direction of the rotation of the cylinder.

10. In a paper-bag machine the combination of a revolving cylinder, the carriage mounted on the cylinder, the cam 52 and the intermediate mechanism for reciprocating the carriage, means for holding the lower ply of the tube to the carriage, consisting of the front clip and the two side clips, the oppositely-disposed tuck-blades, means for moving the tuck-blades into and out of operating positions, means for raising and lowering the tuck-blades away from and toward the top surface of the carriage, means for oscillating the tuck-blades about their shafts, side nippers for holding the upper ply of the tube to the tuck-blades, means for opening and closing the side nippers, all combined and operating substantially as described.

11. In a paper-bag machine the combination of the revolving cylinder, the carriage mounted on the cylinder, the cam 52 and the intermediate mechanism for reciprocating the carriage, means for holding the lower ply of the tube to the carriage, the compression-plate 110, oppositely-disposed tuck-blades and means for oscillating the tuck-blades substantially as described.

12. In a paper-bag machine the combination of the revolving cylinder, the carriage mounted on the cylinder, the cam 52 and the intermediate mechanism for reciprocating the carriage, means for holding the lower ply of the tube to the carriage, the compression-plate 110, means for rotating the compression-plate, oppositely-disposed tuck-blades and means for oscillating the tuck-blades over the top surface of the carriage.

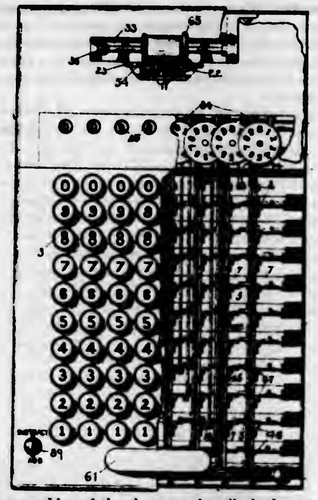
13. In a paper-bag machine the combination of the revolving cylinder, the carriage mounted on the cylinder, the cam 52 and the intermediate mechanism for reciprocating the carriage, the front clip 53 mounted on the carriage, the lever 59 and its hook-shaped ends, means for oscillating the lever 59, all combined and operating that the front clip is opened and closed at each forward and rearward position of the carriage substantially as described.

14. In a paper-bag machine the combination of the revolving cylinder, the carriage mounted on the cylinder, the cam 52 and the intermediate mechanism for reciprocating the carriage, the oppositely-disposed bevel-edged side clips 54 and 55 mounted on the carriage, the levers 67 and 68, each lever having hook-shaped ends and means for oscillating the same all combined and operating that the bevel-edged side clips are opened and closed at each forward and rearward position of the carriage substantially as described.

15. In a paper-bag machine the combination of the revolving cylinder, the carriage mounted on the cylinder, the cam 52 and the intermediate mechanism for reciprocating the carriage, the shafts 92, the tuck-blades mounted on the shafts, means for raising and lowering the tuck-blades away from and toward the top surface of the carriage, means for oscillating the tuck-blades about their shafts all combined and operating that the edges of the tuck-blades follow a predetermined line of the carriage as the same is oscillated forward substantially as described.

818,281. MECHANICAL CALCULATOR AND RECORDER. LUCIUS S. CRANDALL, Brooklyn, N. Y., assignor to Crandall Construction Co., Brooklyn, N. Y., a Corporation of Arizona. Filed Feb. 10, 1904. Serial No. 192,861.

Claim.—1. In a machine of the character described, the combination with a record-printing platen, of means for moving said platen variable longitudinal distances to right or left of a constant normal position to predetermined positions.



2. In a machine of the character described, the combination with a movable record-printing platen, of means for moving said platen variable longitudinal distances to predetermined positions, and means for automatically returning the platen to its initial position.

3. In a machine of the character described, the combination with the key mechanism, the register mechanism actuated thereby, and a series of type-carriers actuated by said key mechanism, of a record-printing platen adjustable on either side of a central normal position, and cam means for throwing said platen to its adjusted position.

4. In a machine of the character described, the combination with the key mechanism, the register mechanism actuated thereby and the type-carriers actuated thereby, of an adjustable platen resting normally in a central position, cam means for adjusting said platen to either the right or left of said normal position, and means for returning said platen to its normal position.

5. In a machine of the character described, the combination with the key mechanism, the register mechanism actuated thereby and the type-carriers actuated thereby, of an adjustable platen resting normally in a central position, an adjustable shuttle-bar, suitable lever connection between the shuttle-bar and the platen, and cam means actuated by the key mechanism for adjusting said shuttle-bar.

6. In a machine of the character described, the combination with the key mechanism and the register mechanism actuated thereby, of a platen-carriage frame, the platen-carriage slidably mounted thereon, a lever connected to said carriage, an adjustable shuttle-bar connected to said lever, means actuated by the key mechanism for adjusting said shuttle-bar to selected positions, and spring-pressed arms bearing against said lever and adapted to hold the same normally in central position.

7. In a machine of the character described, the combination with the key mechanism and the register mechanism actuated thereby, of a jointed platen-carriage frame, a hinged platen-carriage slidably mounted thereon, means for holding said carriage in a central normal position, and means actuated by said key mechanism for adjusting said carriage to either right or left of said central normal position to determine the denominational value of characters printed thereon.

8. In a machine of the character described, the combination with the key mechanism, the register mechanism actuated thereby, an adjustable platen, means for holding said platen normally in central position, a shuttle-bar, lever means connecting said platen and shuttle-bar, a series of shuttle-bars operatively connected to the key mechanism having cam-faces adapted to engage the first-mentioned shuttle-bar to force the platen to either right or left of its central position.

9. In a machine of the character described, the combination

with longitudinal rows of keys, the register mechanism actuated thereby, and a platen adjustable to either right or left of a central normal position, of a shuttle-bar for each longitudinal row of keys, suitable cam connection between the longitudinal rows of keys and their respective shuttle-bars, and suitable connection between the shuttle-bars and the platen to adjust the latter to a position either right or left of its central normal position depending upon the shuttle-bar actuated.

10. In a machine of the character described, the combination with a series of longitudinal rows of keys having different denominational values, an adjustable platen held normally in a central position, of a series of shuttle-bars of different denominational values one for each longitudinal row of keys, suitable cam connection between the rows of keys and their respective shuttle-bars, a laterally-adjustable shuttle-bar having projections thereon mounted in the path of the cam-faces of the said series of shuttle-bars, and suitable connection between the said lateral shuttle-bar and the said platen to communicate motion to the latter upon actuation of the former by any one of the series of denominational shuttle-bars.

11. In a machine of the character described, the combination with the key mechanism, of a register-dial, a transmitting-wheel geared to said dial, reversed ratchet-wheels operatively connected to said transmitting-wheel, an adding-pawl adapted to engage one of said ratchet-wheels, a subtracting-pawl adapted to engage the other of said ratchet-wheels, shuttle-bars actuated by the key mechanism for actuating said pawls upon actuation of the key mechanism, and a governor adapted to guide either one or the other of said pawls into engagement with its respective ratchet-wheel.

12. In a machine of the character described, the combination with the key mechanism, of a register-dial, a transmitting-wheel geared to said dial and suitably mounted in the machine-casing, an adding ratchet-wheel connected to said transmitting-wheel, a subtracting ratchet-wheel also connected to said transmitting-wheel, pawls for engaging the respective ratchet-wheels, suitable connection between the key mechanism and said pawls to actuate the latter simultaneously with the former, and a governor adapted to guide either of the pawls into engagement or hold both out of the path of engagement.

13. In a machine of the character described, the combination with the key mechanism, of the register-dials, the transmitting-wheels geared thereto and having cam projections, the ratchet-wheels operatively connected to each of the transmitting-wheels, the pawls adapted to be projected into the path of their respective ratchet-wheels, the connection between the key mechanism and the said pawls, the antifriction-wheel in the path of and adapted to engage the cam projections on a transmitting-wheel of lower denomination, the connection between the antifriction-wheel and the pawls of the transmitting-wheel of next higher denomination, and the means for throwing either of the said pawls into the path of engagement with their respective ratchet-wheels.

14. In a machine of the character described, the combination with the dial, the transmitting-wheel geared thereto, the shuttle-bar adapted to be actuated by depression of the keys, pawl-and-ratchet connection between said transmitting-wheel and said shuttle-bar, the projections on the transmitting-wheel, the stop-plate adapted to be thrown into the path of said projections, and the means independent of the keys for throwing said stop-plates into the path of the projections and actuating said shuttle-bar.

15. In a machine of the character described, the combination with the dial, the transmitting-wheel geared thereto and having projections thereon, the longitudinal row of keys having graduated cam-faces, the shuttle-bar engaging and adapted to be actuated by said cam-faces, pawl-and-ratchet mechanism adapted to actuate the transmitting-wheel and connected to said shuttle-bar, the stop-plate adapted to be thrown into the path of the projections on the transmitting-wheel, means independent of the keys for actuating said shuttle-bar, and a flexible connection between said independent actuating means and said stop-plate and shuttle-bar.

16. In a machine of the character described, the combination with the key mechanism, the register mechanism actuated thereby, of a record-printing platen adjustable to either side of a normal central position, means for adjusting said platen by direct action of said key mechanism, and means for printing a record upon said platen.

17. In a machine of the character described, the combination with the key mechanism, the register mechanism, the record-printing mechanism comprising the record-printing platen, and the platen-shift mechanism, of intermediate mechanism actuated directly by the action of the key mechanism to actuate said register, printing and platen shift mechanisms simultaneously with the actuation of said key mechanism.

18. In a machine of the character described, the combination with the key mechanism, the register mechanism, the record-printing mechanism comprising the record-printing platen, and the platen-shift mechanism, of intermediate mechanism actuated directly by the action of the key mechanism to actuate said register, printing and platen shift mechanisms actuated simultaneously, and at one operation with the actuation of said key mechanism.

19. In a machine of the character described, the combination with the key mechanism and the indicators, of a pair of pawls for each of said indicators operated by said key mechanism to operate said indicators in either direction and means for moving either of said pawls into operative engagement, or for holding both of said pawls out of operative engagement.

20. In a machine of the character described, the combination with the key mechanism and the indicators, of a pair of pawls for each of said indicators operated by said key mechanism to operate said indicators in either direction, shuttle-bars actuated by said key mechanism for operating said pawls and means for moving either of said pawls into operative engagement.

21. In a machine of the character described, the combination with the key mechanism and the indicators, of a rock-arm for each of said indicators, duplicate pawls mounted on each of said rock-arms, shuttle-bars actuated by said key mechanism for operating said rock-arms and means for moving either of said duplicate pawls into operative engagement to determine the direction of movement of an indicator.

22. In a machine of the character described, the combination with the key mechanism and the indicators, of addition and subtraction pawls for operating said indicators, shuttle-bars for operating said pawls and operated by said key mechanism and means for moving either the addition or the subtraction pawl into or out of operative engagement.

23. In a machine of the character described, the combination with the key mechanism and the indicators, of addition and subtraction pawls for operating each of said indicators, shuttle-bars for operating said pawls and operated by said key mechanism, means for moving either the addition or the subtraction pawl into or out of operative engagement, and carrying mechanism for transferring items from one indicator to the indicator of next higher denomination.

24. In a machine of the character described, the combination with the key mechanism and the indicators, of transmitting-wheels for operating said indicators, a pair of pawls for each of said wheels for operating each of said wheels in either direction and operated by said key mechanism, and a series of devices independent of said key mechanism operated by transmitting-wheels of lower denomination for operating the pawls of transmitting-wheels of next higher denomination.

25. In a machine of the character described, the combination with the key mechanism and the indicators, of transmitting-wheels for operating said indicators, a pair of pawls for each of said indicators for operating each of said indicators in either of two directions and operated by said key mechanism, a series of devices independent of said key mechanism operated by transmitting-wheels of lower denomination for operating pawls of next higher denomination, and means for moving either pawl of the respective pairs of pawls into or out of operative engagement.

26. In a machine of the character described, the combination with indicators and transmitting-wheels for driving said indicators, of pawls for driving said transmitting-wheels and key mechanism for operating said pawls, and means independent of said key mechanism operated periodically by transmitting-wheels of lower denomination for operating the key-actuated pawls of indicators of the next higher denomination.

27. In a machine of the character described, the combination with the key mechanism and the indicators, of key-operated pawls for driving said indicators and means independent of said key mechanism for operating key-actuated pawl of higher denomination at definite periods in the movement of indicators of lower denomination.

28. In a machine of the character described, the combination with the key mechanism and the indicators, of key-operated pawls for driving said indicators, means independent of said key mechanism for operating a pawl of higher denomination at definite periods in the movement of an indicator of next lower denomination, and means for moving said pawls into or out of operative engagement.

29. In a machine of the character described, the combination with the key mechanism and the indicators, of transmitting-wheels for driving said indicators, of addition and subtraction pawls for driving each of said transmitting-wheels and operated by said key mechanism, and means for moving either of said pawls into or out of operative engagement or holding both of said pawls out of operative engagement.

30. In a machine of the character described, the combination with an adjustable record-printing platen and record-printing devices, of means for moving said platen from a normal position for a printing impression, means for automatically returning said platen to normal position after said impression, a ratchet-wheel on said platen, a pawl for actuating said ratchet and a key-actuated lever for actuating said pawl.

31. In a machine of the character described, the combination with an adjustable record-printing platen and record-printing devices, of means for moving said platen longitudinally from a normal position for a printing impression, means for automatically returning said platen to normal position after said impression and key-actuated line-spacing mechanism.

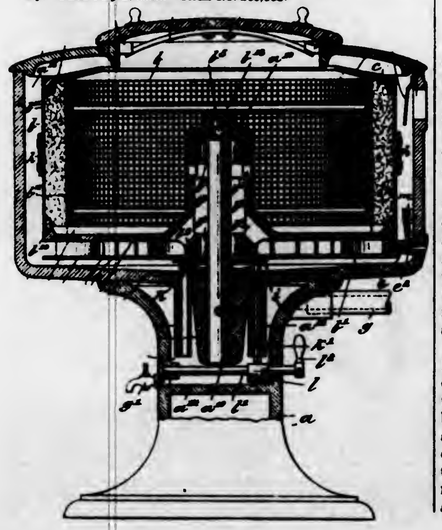
32. In a machine of the character described, the combination with a record-printing platen, of means for moving said platen variable longitudinal distances to right or left of a constant normal position for a printing impression, means for printing a record upon said platen and means for automatically returning said platen to normal position after the printing impression.

33. In a machine of the character described, the combination with the key and register mechanism, of a platen, means for variably adjusting the platen to predetermined printing positions and means for automatically returning said platen to normal position after each printing impression.

34. In a machine of the character described, the combination with the key mechanism and the indicators, of transmitting-wheels for actuating said indicators, a pawl for each of said wheels for actuating the same, means operated by the key mechanism for operating said pawls, projections in zero positions on said wheels, stop devices adapted to be thrown into the path of said projections, flexible means for operating said pawls simultaneously to variable extents to throw the projections against the stop devices and means for throwing the stop devices into the paths of the projections.

35. In a machine of the character described, the combination with the key mechanism and an indicator, a pair of ratchet-wheels for operating said indicator, a pair of pawls operated by said key mechanism one for actuating each ratchet wheel and engaging diametrically opposite points of said wheels, flexible means for drawing said pawls toward each other and a forked rocking governor adapted when in central position to hold both of the pawls out of operative engagement and when in either of its extreme positions to hold but one of said pawls out of operative position.

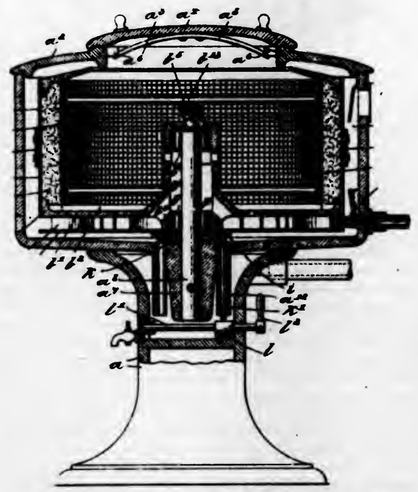
818,282. **CENTRIFUGAL MACHINE.** EDWARD H. DUTCHER, Siegfried, Pa., assignor, by direct and mesne assignments, to Lehigh Oil and Waste Saving Company, Camden, N. J., a Corporation of New Jersey. Filed July 3, 1905. Serial No. 268,105.



Claim.—1. In a centrifugal oil extracting and filtering machine, a housing and a receptacle for an oil-containing material having a bottom plate with a fixed outer wall and an expansible and contractible inner wall, said inner and outer walls forming a chamber, wherein filter material is adapted to be placed, spring-acting means adapted to hold said inner wall in required varying positions with respect to said filter material and the latter with said outer wall, and means for rotating said receptacle.

2. In a centrifugal oil extracting and filtering machine, a stationary housing and a receptacle for an oil-containing material having a bottom plate with a fixed perforated outer wall and a movable perforated inner wall, said inner and outer walls forming a chamber, wherein filter material is adapted to be placed, springs adapted to engage said inner wall so as to force the wall against said filter material and the latter against the outer wall and means for rotating said receptacle.

818,283. **SPEED-CONTROLLING MECHANISM FOR CENTRIFUGAL MACHINES.** EDWARD H. DUTCHER, Siegfried, Pa., assignor, by direct and mesne assignments, to Lehigh Oil and Waste Saving Company, Camden, N. J. Original application filed July 3, 1905, Serial No. 268,105. Divided and this application filed Oct. 7, 1905. Serial No. 281,741.



Claim.—1. In a speed-controlling mechanism for centrifugal oil extracting and filtering machines, a stationary housing having a basket for oil-containing material rotatably arranged therein, wings held in alinement and connected with said basket and adapted to be moved radially thereto by centrifugal force and by air acting upon a portion thereof, to automatically retard excessive speed of rotation of said basket by exposing the entire surface to the resistance of the air.

2. In a speed-controlling mechanism for centrifugal oil extracting and filtering machines, a stationary housing having a basket for oil-containing material rotatably arranged therein, wings held in alinement and connected with said basket and adapted to be moved radially thereto by centrifugal force and by air acting upon a portion thereof, to automatically retard excessive speed of rotation of said basket by exposing the entire surface to the resistance of the air, and means supported by said housing and adapted, when manually actuated, to engage said basket to retard and stop rotation thereof.

3. In a speed-controlling mechanism for centrifugal oil extracting and filtering machines, a stationary housing having a basket for oil-containing material, means connected with said basket adapted to actuate the same, wings held in alinement and connected with said basket and adapted to be moved radially thereto by centrifugal force and by air acting upon a portion thereof, to automatically retard excessive speed of rotation of said basket by exposing the entire surface to the resistance of the air, a ring arranged below the actuating means for said basket having an extension and a cam adapted, when actuated, to raise said ring by engaging said extension, to force the

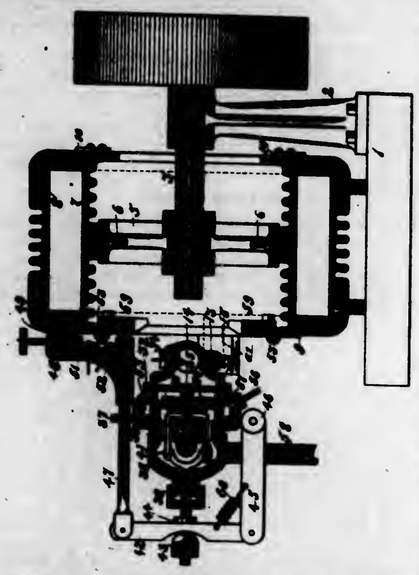
same against the actuating means of said basket to retard and stop rotation thereof.

---

2. In a wagon-gear and in combination with the front gear-hounds, tongue-hounds having their rear portion elevated and their upright lugs on the tongue-hounds, and a draw-bolt extending through said lugs and connecting said hounds together on an axis

same against the actuating means of said basket to retard and stop rotation thereof.

813,284. ROTARY ENGINE. GEORGE H. BOELER, Akron, Ohio. Filed Jan. 3, 1905. Serial No. 239,464.



Claim.—1. The combination in an engine of the class described, of an outer inclosing cylinder having inturned annularly-formed heads, each provided with an opening therein, said openings being in longitudinal alinement with each other, a longitudinally-split cylindrically-formed piston arranged in said openings, whereby an annular space will exist between said cylinder and the outer periphery of said piston, means to retain said piston in said openings, means to constantly force the portions of said piston against the walls of said openings in said cylindrical heads, a plurality of blades in said annular space a portion of which are hinged to the piston and the balance to the inside of said cylinder, said blades arranged to pass each other during the rotation of said piston, means to hold the blades hinged on said cylinder against said piston, and means to hold the blades mounted on said piston against the inside surface of said cylinder.

2. The combination in an engine of the class described, of an outer inclosing cylinder having inturned annularly-formed heads, each provided with an opening therein, a piston arranged in said openings, whereby an annular space will exist between said cylinder and the outer periphery of said piston, means to retain said piston in said openings, means movable in said annular space and attached pivotally to said piston to receive the impact of a propelling fluid introduced to said annular space, means to convey a propelling fluid to said annular space at diametrically opposite points thereof, an explosion-chamber arranged in connection with said induction means, an igniting device placed in said explosion-chamber, a carriage mounted on said cylinder radially adjustable in position with respect thereto, a circuit-breaker mounted on said carriage and suitably connected with said igniting device, and means on said piston to close said circuit-breaker.

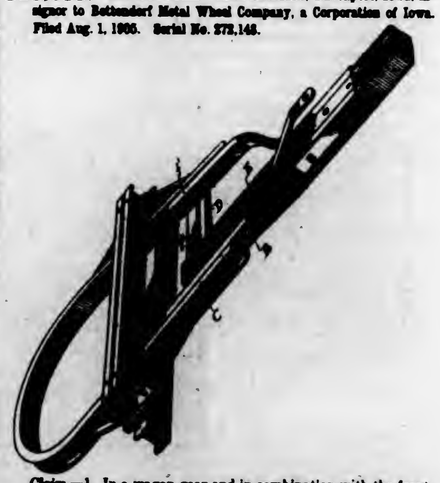
3. The combination in an engine of the class described, of an outer inclosing cylinder having inturned annularly-formed heads, each provided with an opening therein, said openings being in longitudinal alinement with each other, a piston arranged in said openings, whereby an annular space will exist between said cylinder and the outer periphery of said piston, means to retain said piston in said openings, means movable in said annular space and attached pivotally to said piston to receive the impact of a propelling fluid introduced to said annular space, means to introduce a propelling fluid to said annular space at opposite points thereof, an explosion-chamber arranged in connection with said induction means, an igniting device in said explosion-chamber, a carriage mounted on said cylinder and adjustable in position with respect to the position of said induction means, a circuit-breaker on said carriage suitably connected with said igniting device, means on said piston to close said circuit-breaker, and means to close the inlet of fluid to said explosion-chamber.

4. The combination in an engine of the class described, of an outer inclosing cylinder having inturned annularly-formed heads, each provided with an opening therein, said openings being in longitudinal alinement with each other, a piston arranged in said openings, whereby an annular space will exist between said cylinder and the outer periphery of said piston, means to retain said piston in said openings, means movable in said annular space and attached pivotally to said piston to receive the impact of a propelling fluid introduced to said annular space, means to introduce a propelling fluid to said annular space at opposite points thereof, an explosion-chamber in said induction means, an igniting device in said explosion-chamber, a circuit-breaker suitably mounted and connected with said igniting device, means on said piston to close said circuit-breaker, and means to change the position of said circuit-breaker with respect to the position of said induction means.

5. The combination in an engine of the class described, of an outer inclosing cylinder provided with oppositely-disposed exhaust-ports, a piston arranged to rotate within said cylinder and separated therefrom to form an air-space, means to introduce to said air-space a propelling fluid equally at diametrically opposite points, an explosion-chamber mounted in said induction means, a valve to control the inlet of the propelling fluid to said explosive-chamber, a carriage mounted on said cylinder and adjustable in position with respect to the exhaust-ports of said cylinder, means mounted in said carriage to operate said valve, and means mounted on said piston to operate said last-named means and close said valve substantially as shown and described.

6. The combination in an engine of the class described, of an outer inclosing cylinder provided with oppositely-disposed exhaust-ports, a piston arranged to rotate within said cylinder and separated therefrom to form an air-space, means to introduce to said air-space a propelling fluid, an explosive-chamber in said induction means, a valve to control the entrance of the propelling fluid to said explosive-chamber, a carriage mounted on said cylinder and adjustable in position with respect to the position of the exhaust-ports of said cylinder, means on said carriage to operate said valve, means on said piston to operate said last-named means, a circuit-breaker mounted on said carriage, and means on said piston to close said circuit-breaker substantially as shown and described.

813,285. WAGON-GEAR. EMIL EINFELDT, Davenport, Iowa, assignor to Bettendorf Metal Wheel Company, a Corporation of Iowa. Filed Aug. 1, 1905. Serial No. 272,148.



Claim.—1. In a wagon-gear and in combination with the front gear-hounds, tongue-hounds, a draft connection between said hounds, and a tongue sustained by the tongue-hounds with its axis in an unchanging plane relative to the gear-hounds with its upper surface, at the point where the doubletree is applied, extending at a lower level than that of the axis of the draft connection when the tongue is in a horizontal position.

2. In a wagon-gear and in combination with the front gear-hounds, tongue-hounds having their rear portion elevated and their forward portion depressed and in a different plane, a draw-bolt connecting the elevated portion of the tongue-hounds with the gear hounds, and a tongue connected with the depressed portion of the tongue-hounds at a point in front of the draw-bolt and extending rearwardly beneath said draw-bolt.

3. In a wagon-gear and in combination with the front gear, tongue-hounds connected with said gear and extending forwardly and downwardly below the connection, a tongue connected with the downwardly-extending portion of the tongue-hounds, and having its upper surface at a lower level than said connection when the tongue is in a horizontal position, and a doubletree applied to the upper side of the tongue.

4. In a wagon-gear and in combination with the front gear-hounds, tongue-hounds extending for a portion of their length along the gear-hounds and then extending beyond said gear-hounds downwardly, a connection between the gear-hounds and the tongue-hounds, and a tongue fixed to the downwardly-extending portions of the gear-hounds.

5. In a wagon-gear and in combination with the front gear-hounds, tongue-hounds extending downwardly at their forward ends, a draw-bolt connecting the tongue-hounds, in rear of their downwardly-extending portions, with the gear-hounds, a tongue fixed to the downwardly-extending portions of the gear-hounds, and extending rearwardly beneath the draw-bolt, and a connection between the tongue and tongue-hounds in rear of their downwardly-extending portions.

6. In a wagon-gear and in combination with the front gear-hounds, tongue-hounds connected therewith and extending forwardly and downwardly with the forward portion of the hounds in a different plane from the rear portions, and a tongue connected with the downwardly-extended portion of the tongue-hounds.

7. In a wagon-gear and in combination with the front gear-hounds, a tongue, tongue-hounds connected with the tongue and bent upwardly and extending rearwardly in a plane above a plane of the tongue, and a pivotal connection between the elevated portion of the tongue-hounds and the gear-hounds.

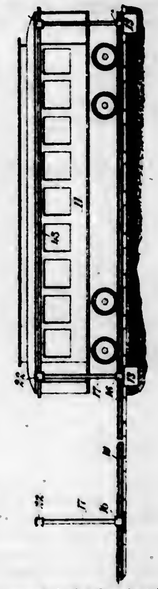
813,286. WAGON-GEAR. EMIL EINFELDT, Davenport, Iowa, assignor to Bettendorf Metal Wheel Company, a Corporation of Iowa. Filed Aug. 8, 1905. Serial No. 273,944.

Claim.—1. In a wagon-gear the combination of the front gear-hounds, a tongue, tongue-hounds applied to the tongue, and a connection between the gear-hounds and tongue-hounds said connection having its axis constantly in an unchanging plane relative to the gear-hounds disposed above the general plane of said hounds when the tongue is in a horizontal position, substantially as described.

2. In a wagon-gear, the combination of the front gear-hounds, the tongue, tongue-hounds applied to the tongue, upright projections on said hounds, and a connection between said projections having its axis extending in an unchanging plane relative to the gear-hounds.

3. In a wagon-gear, the combination of the front gear-hounds, upright lugs thereon, a tongue, tongue-hounds applied to the tongue, upright lugs on the tongue-hounds, and a draw-bolt extending through said lugs and connecting said hounds together on an axis disposed in a single unchanging plane relative to the gear-hounds, substantially as described.

813,287. ELECTRIC-TRACTION SYSTEM. JAMES P. GORMAN, Jr., New York, N. Y. Filed Mar. 31, 1905. Serial No. 253,180.



Claim.—1 A contact device for electric-traction systems comprising a pole, a conductor extending through the pole and having its upper end threaded, a contact-block surrounding the conductor, and a nut operating upon the conductor-thread above the contact-block.

2. A contact device for electric-traction systems comprising a pole, an insulating-plate carried upon the top of the pole, a contact-block situated above the insulating-plate, a second insulating-plate coöperating with the contact-block, and a conductor extending through the pole, block and plates.

3. A contact device for electric-traction systems comprising a pole, an insulating-plate carried upon the top of the pole, a contact-block situated above the insulating-plate, a second insulating-plate coöperating with the contact-block, bearing-plates lying between the contact-block and insulating-plate, and a conductor extending through the pole, block and plates.

4. In an electric-traction system, a contact device comprising a pole, conductors extending through the pole, opposite contact-blocks movable upon the conductors above the pole, and a yieldable insulating-block situated between the contact-blocks.

5. In an electric-traction system, a contact device comprising a pole, conductors extending through the pole, opposite contact-blocks movable upon the conductors above the pole, securing means upon the conductors for retaining the contact-blocks in place, and an insulating member lying above the blocks and securing means.

6. In an electric-traction system, the combination with a conduit, of a junction-box included therein, a cover for the box provided with a socket, a pole having a contact member and entering the socket, screws threaded through the socket and engaging the pole, and conductors extending through the conduit and pole to the contact member.

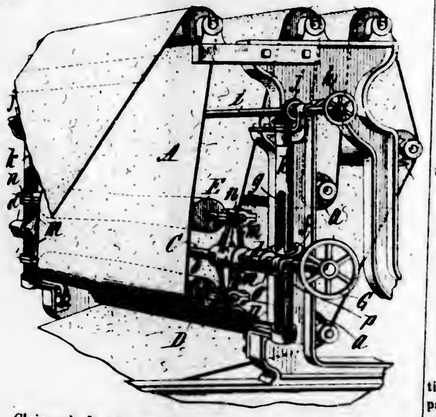
7. In an electric-traction system, the combination with a conduit, of a junction-box included therein, a cover for the box provided with a socket, a pole having a contact member and entering the socket, a fluid insulating-filling within the junction-box, screws threaded through the socket and engaging the pole, and conductors extending through the conduit and pole to the contact-member.

8. In an electric-traction system, the combination with a con-

duit, of a junction-box included therein,

duit, of a junction-box included therein, a cover for the box provided with a socket, a pole having a contact member and entering the socket, a fluid insulating-filling within the junction-box and into which the lower end of the pole extends, screws threaded through the socket and engaging the pole, and conductors extending through the conduit and pole to the contact member.

813,288. **FELT-REGULATING DEVICE FOR PAPER-MACHINES.** THOMAS HANCOCK, Holyoke, Mass. Filed July 3, 1905. Serial No. 268,223.



Claim.—1. In a paper-machine, the combination with the press-felt, of a pair of axially-parallel guide-rolls, around which the felt runs, one of said rolls tapering from its middle portion outwardly, and the other roll tapering from its opposite ends toward its middle, and a support, on which said pair of rolls are mounted for rotation, and which support is movably mounted for reversed presentations of said pair of rolls in relation to the felt.

2. In a paper-machine, the combination with the press-felt, of a shaft or bar transversely and horizontally mounted and rotatably adjustable in the frame of the machine, and having at the opposite end portions thereof rigid arms, a pair of separated axially-parallel felt guide-rolls, one tapering from its middle portion outwardly and the other tapered from its opposite ends toward its middle, and journaled for rotation in the arms carried by said shaft, and means for confining said rotatably-adjustable shaft in any given adjustment.

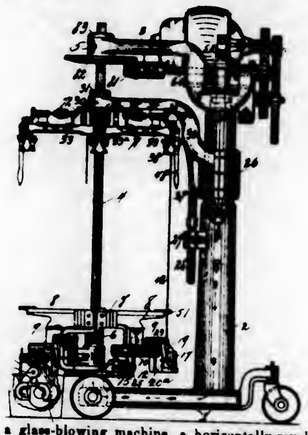
3. In a paper-machine, the combination with the felt, of a pair of axially-parallel guide-rolls, around which the felt runs, one of said rolls tapering from its middle portion outwardly, and the other roll tapering from its opposite ends toward its middle, and a support, on which said pair of rolls are mounted for rotation, said support being mounted for roll-positioning adjustment about a horizontal axis transverse of the machine, and said support being also adjustably movable in the line of the run of the felt, for the purposes set forth.

4. In a paper-machine, the combination with the felt, of a shaft or bar transversely and horizontally mounted and rotatably adjustable in the frame of the machine, and bodily adjustable in a line at right angles to its axis, and having at the opposite end portions thereof rigid arms, a pair of separated axially-parallel felt guide-rolls, one tapering from its middle portion outwardly and the other tapered from its opposite ends toward its middle, and journaled for rotation in the arms carried by said shaft, and respective means for bodily adjusting said shaft, for rotationally adjusting it, and for confining it in its respectively adjusted positions.

813,289. **GLASS-BLOWING MACHINE.** NOBLE W. HARTMAN, Toledo, Ohio, assignor of one-half to George W. Burthart, Detroit, Mich. Filed June 6, 1904. Serial No. 211,313.

Claim.—1. In a glass-blowing machine, a series of mold-holders, sectional molds mounted on said holders, means for revolving said series horizontally, a detached vessel which forms a bath for the molds, means for opening and closing the molds successively at fixed points in their rotation, and means for passing the opened molds endwise through said bath.

2. In a glass-blowing machine, a series of mold-holders, shafts upon one end of which the holders are rigidly mounted and which form pivotal supports for the mold-holders, crank-arms rigidly connected with the other end of said shafts, rollers on the crank-arms, a fixed segmental track for said rollers, means for revolving horizontally the series of mold-holders and their shafts and cranks, and a mold-cooling vessel which coincides with the cut-away portion of the segmental track.



3. In a glass-blowing machine, a horizontally-revoluble sectional mold composed of two pivotally-connected parts, a shaft, a pair of arms secured to said shaft, a pair of rods swiveled at one end to the mold parts and adjustably connected at the other end to said arms, a crank on the shaft, a roller on the crank, and a segmental track for the roller.

4. In a glass-blowing machine, a shaft having its bearings in a horizontally-revoluble sleeve, a mold-carrier secured to the shaft, a crank-arm secured to the shaft, a roller on the crank-arm, a mold comprising two pivotally-connected sections mounted upon the mold-carrier, another shaft, two arms secured to said other shaft and pivotally connected with said mold-sections, a crank-arm secured to said other shaft, a roller on said latter crank-arm, and a fixed mutilated disk upon which said two rollers travel in segmental paths, the path of the first-mentioned roller forming a greater arc than the path of the other roller.

5. In a glass-blowing machine, a base, an upright column thereon, an arm secured to the top of the column, a vertical shaft revoluble in bearings on the base and at the end of said arm, said shaft being vertically movable in said bearings, means for revolving the shaft, a sleeve slidable on the column, an arm projecting from the sleeve, means on said latter arm for the support of the shaft, means for the vertical adjustment of the sleeve, and a series of molds and a corresponding series of blowing mechanisms connected with and driven by the shaft.

6. In a glass-blowing machine, a series of horizontally-revoluble mold-carrying arms, molds thereon, a corresponding series of hollow blowing-arms carried above the molds, a hollow shaft concentric with and which drive said two series of arms in unison, the hollow of the upper arms being in communication with the hollow of the shaft, a normally closed air-valve in each of said upper arms, means for successively opening and closing said valves, means for supplying air through the hollow of the shaft, and means for conducting air from the extremities of the upper arms to the molds.

7. In a glass-blowing machine, a shaft, an arm secured to and revoluble with the shaft and having a longitudinal air-passage connected with a source of compressed air, a normally closed valve in the air-passage of the arm, a lever fulcrumed on the arm, connections between the lever and the valve, a roller on the lever, a track on which the roller travels, and means for the adjustment of the track.

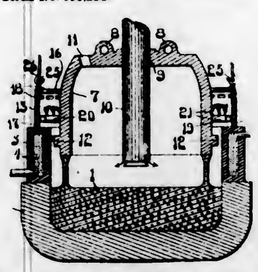
8. In a glass-blowing machine, a vertical shaft, a horizontal arm secured to and revoluble with the shaft and having therethrough a longitudinal air-passage connected with an air-supply, a valve in the air-passage of the arm, and means for automatically controlling the flow of air through the valve, comprising a lever fulcrumed on the arm and connected with the valve, a roller on the lever, a flat segmental ring which forms a track for the roller, a stationary member, and adjusting-screws engaged with the stationary member and with the ring-segment.

9. In a glass-blowing machine, a main shaft, an arm secured to and revoluble with the shaft and having a longitudinal air-passage connected with a source of compressed air, a short shaft journaled in the end of the arm and having air-passages in communication with the air-passage in the arm, a blow-iron holder upon one end of the short shaft, a fixed mutilated friction-disk, a friction-wheel mounted on the arm and adapted to engage the friction-disk during a part of the revolution of the main shaft, driving connections between the friction-wheel and the short shaft, and means for revolving the main shaft.

10. In a glass-blowing machine, a base, a hollow upright column, an air-pump in the column, an arm on the column, a shaft journaled in the arm, a series of molds and a corresponding series of blowing mechanisms revoluble with the shaft, connections between the hollow of the column and said blowing mechanisms, and means for revolving the shaft and for actuating the air-pump.

11. A glass-blowing machine comprising a hollow base, a hollow column thereon having an arm at its top, a vertical hollow shaft journaled and longitudinally movable in said arm and in bearings on the base, the hollows of the base column and shaft being connected, a series of horizontal arms revolubly connected with the shaft by spline and feather, a series of molds supported by said arms, means for opening and closing and dipping the molds successively at each revolution of the shaft, a vertically-movable collar on the column, means for securing the collar in adjusted position, an arm on the collar, bearings on the latter arm which carry the shaft, a series of hollow arms, corresponding with the first-mentioned series of arms, secured to the shaft and having their hollows in communication with the hollow of the shaft, holders on the first-mentioned arms for the lower part of blow-irons, holders for such blow-irons at the extremities of the hollow arms, the latter holders being adapted to place the hollows of the arms and of such blow-irons in operative connection, an air-pump in the column, a motor on the column geared to drive the air-pump and the shaft, and means for admitting air from the hollow arms to the blow-irons and for revolving the blow-irons during a limited part of the rotation of the shaft.

813,290. **GLASS-DRAWING MACHINE.** GEORGE H. HARVEY, Glenfield, Pa., assignor, by mesne assignments, to Brownsville Glass Company, Pittsburg, Pa., a Corporation of Pennsylvania. Filed Mar. 3, 1904. Serial No. 196,254.



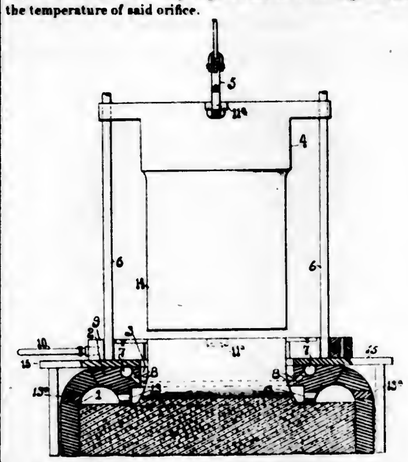
Claim.—1. In the manufacture of glass, a gatherer adapted to draw glass from a receptacle, a burner encircling the gatherer, said burner in part being composed of pipes hinged together and a heat-retainer encircling said gatherer and made in pivoted sections.

2. In the manufacture of glass, a gatherer adapted to draw glass from a receptacle, a circular rib on the gatherer, a burner composed of pipes pivoted together, and a heat-retaining device surrounding said burner and also composed of pivoted sections, said rib located so as to pick up said burner and heat-retaining device after the gatherer has ascended to bring the lower end of the gatherer within the zone of heat.

813,291. **GLASS-DRAWING MACHINE.** GEORGE H. HARVEY, Glenfield, Pa., assignor, by mesne assignments, to Brownsville Glass Company, Pittsburg, Pa., a Corporation of Pennsylvania. Filed Apr. 13, 1903. Serial No. 152,308.

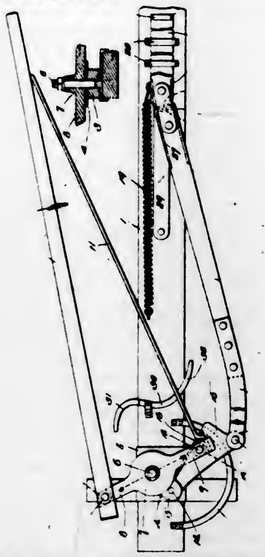
Claim.—1. In the art of manufacturing glass, a receptacle adapted to contain glass in a liquid or semiliquid state, a refining-ring supported thereon, and means of communication between said receptacle and the interior of said refining-ring above the level of the glass.

2. In the art of manufacturing glass, a receptacle containing glass in a liquid or semiliquid form, a refining-ring supported thereon, an orifice in said refining-ring, and means in the ring for reducing the temperature of said orifice.



3. In the art of manufacturing glass, a receptacle adapted to contain glass in a liquid or semiliquid form, a refining-ring supported thereon, means of communication between said receptacle and the interior of the refining-ring above the level of the glass, and means for reducing the temperature in the orifice of said refining-ring.

813,292. **PRESS-OPERATING DEVICE.** JOSEPH L. HAVERFIELD, Mayfield, Ky., assignor to Mayfield Mfg. Co., Mayfield, Ky. Filed Mar. 11, 1905. Serial No. 249,609.



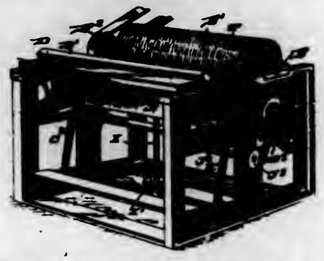
Claim.—In a device of the class described, a head supported for rotation and having radially-extending arms provided with downward-extending cam-engaging members, a cam-plate fulcrumed eccentrically to the rotary head and having an upstanding flange disposed in the path of the cam-engaging members, a reciprocatory plunger, a pitman having one end connected with said plunger and its other end with the free end of the cam-plate, and a cam-lever pivotally supported adjacent to the rotary head; said cam-lever having a curved arm offset upwardly and disposed in the path of the cam-

engaging members, and an oppositely-extending curved arm dis-

ing the front and rear walls of its opening flared inward and forward, said plates being equal in thickness to the diameter of the

engaging members, and an oppositely-extending curved arm disposed in the path of one of the plates connecting the pitman with the cam-plate.

813,293. SKIN-STRETCHING MACHINE. ALBERT A. HELLWIG, Gloversville, N. Y. Filed May 2, 1905. Serial No. 258,491.



Claim.—1. In a machine of the kind described, the combination with a cylinder, of oppositely-moving belts, a sliding table carrying a pressure-roller and a pressure-plate which are adapted for coöperation with the said cylinder and belts respectively.

2. In a machine of the kind described, the combination with a cylinder, of oppositely-moving belts, a sliding table, a pressure-roller and a pressure-plate carried by the table and adapted for coöperation with the roller and belts respectively, and a stretching-frame connected to and adapted to be thrown into operation by the table, all substantially as specified.

3. In a machine of the kind described, the combination with an abrasion-cylinder, of oppositely-moving stretching-belts, a stretching-frame, and means for operating the frame.

4. In a machine of the kind described, the combination with an abrasion-cylinder, and a pressure-roller, of a stretching-frame for drawing a skin through the abrasion-cylinder and roller against the rotation of the said cylinder, oppositely-moving belts, and a pressure-plate for holding a skin against the belts.

5. In a machine of the kind described, the combination with an abrasion-cylinder, of a stretching-frame, means for operating the frame, a sliding table operatively connected to the frame for throwing the said frame into engagement with the operating means.

6. In a machine of the kind described, the combination with an abrasion-cylinder, of a stretching-frame, oppositely-moving belts, a sliding table carrying a pressure roller and plate, and operatively connected with the stretching-frame.

7. In a machine of the kind described, the combination with an abrasion-cylinder, of a stretching-frame, means for operating the frame, of a sliding table connected with the frame and adapted for moving the latter into engagement with the operating means, a pressure roller and plate carried by the table, oppositely-moving belts, means for operating the belts, and means for operating the table, substantially as specified.

8. In a machine of the kind described, the combination with an abrasion-cylinder, of a stretching-frame, a sliding table connected to the frame, oppositely-moving belts, a corrugated bar arranged above the belts, a pressure roller and plate carried by the sliding table for operation with the abrasion-cylinder and belts respectively, and an angle-plate for operation with the corrugated bar.

9. In a machine of the kind described, the combination with an abrasion-cylinder, of a stretching-frame, comprising the slotted rack-arms and a cross-bar, a sliding table having a pressure-roller journaled therein, the shaft of said roller extending through the slots in the rack-arms, gears for engagement with the rack-arms, and by which the frame is operated when the table is moved toward the abrasion-cylinder, and means for operating the table.

10. In a machine of the kind described, the combination with a frame, having an abrasion-cylinder mounted thereon, of a stretching-frame, said frame comprising the slotted rack-arms, and cross-bar connecting the arms, a sliding table connected to the stretching-frame, a shaft having pinions for engagement with the rack-arms when the table is moved toward the abrasion-cylinder, oppositely-moving belts operating within the frame, a corrugated bar arranged within the frame, a pressure roller and plate carried by the table and adapted for operation with the abrasion-cylinder and belts respectively, an angle-plate carried by the table for operation with the corrugated bar, an intermeshing gear and pinions for operating the belts, and a drive-pinion for operating the gear

11. In a machine of the kind described, the combination with a frame, of an abrasion-cylinder journaled thereon, a sliding table operating upon the frame, a pressure-roller journaled in the forward end of the table, a stretching-frame movably positioned upon the frame and connected with the sliding table, a corrugated bar arranged within the frame, adjacent the abrasion-cylinder, oppositely-moving belts arranged within the frame and directly below the corrugated bar, an angle-plate and pressure-plate carried by the table, a treadle for operating the table, and means for operating the stretching frame and belt respectively.

12. In a machine of the kind described, the combination with a frame, of an abrasion-cylinder journaled thereon, a sliding table operating upon the frame, a pressure-roller journaled in the end of the table, the shaft of the roller projecting beyond the edge of the table, a stretching-frame having slotted rack-arms through which the ends of the shaft of the pressure-roller project, a shaft journaled in the frame, and having pinions for engagement with the slotted rack-arms of the stretching-frame, shafts vertically journaled in the frame and having pulleys at their upper ends, pulleys journaled to the sides of the frame, belts operating upon the pulleys, a short shaft journaled in the frame and having a beveled pinion for engagement with a beveled pinion carried by one of the vertically-journaled shafts, an intermeshing gear and pinions for imparting motion to the short shaft, intermeshing pinions carried by the vertical shafts, and an angle and pressure plate carried by the sliding table, all substantially for the purposes set forth.

13. In a machine of the kind described, the combination with an abrasion-cylinder, of oppositely-moving stretching-belts, a stretching-frame, means for operating the frame, and an operating-table connected to the said frame and adapted to move the frame into and out of engagement with the said operating means.

14. In a skin-stretching machine, the combination with an abrasion-cylinder, of oppositely-moving belts, a sliding table, means carried by the table for holding a skin into engagement with the cylinder, and belts, and also means for drawing the skin through the machine.

15. In a skin-stretching machine, the combination with an abrasion-cylinder, of oppositely-moving belts, a corrugated bar arranged adjacent the cylinder, a sliding table carrying a pressure-roller and pressure-plates, which are adapted for pressing a skin into engagement with the cylinder, belts, and bar, and means for drawing the skin through the machine.

16. In a machine of the kind described, the combination with an abrasion-cylinder, of oppositely-moving belts, a bar arranged adjacent the cylinder, a sliding table carrying a pressure-roller, an adjustable plate, and stationary plates connected to the table, means for operating the table, and also means for operating the frame when the table is moved forwardly.

17. In a machine of the kind described, the combination with a frame, of an abrasion-cylinder, oppositely-moving belts, a corrugated bar, a sliding table carrying a pressure-roller and pressure-plates, a movable stretcher-frame, and means for operating the frame said frame being connected to the table and adapted to be thrown into engagement with the said operating means.

18. In a machine of the kind described, the combination with a frame, of an abrasion-cylinder journaled in the frame, stretching-belts, a sliding table, a stretcher-frame connected to the table, and continuously-operating means adapted for engagement by the frame when the table is moved forwardly and disengaged when the table is moved rearwardly, as specified.

19. In a machine of the kind described, the combination with a frame, of an abrasion-cylinder journaled therein, continuously-operating stretching-belts, a sliding table, a continuously-operating shaft journaled in the frame, and having pinions fastened thereto, and a stretcher-frame hold upon the frame of the machine and connected to the said table, said frame having rack-sections which are adapted for engagement with the pinions when the table is moved forwardly and disengaged when the position of the table is reversed.

20. In a machine of the kind described, the combination with an abrasion-cylinder, of oppositely-moving belts, a corrugated bar, a sliding table carrying a pressure-roller, a horizontally-disposed adjustable pressure-plate connected to the table, vertically-disposed stationary plates connected to the table, and a stretcher-frame connected to and adapted to be thrown into operative position by the table.

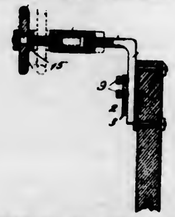
813,294. HAME. WILLIAM H. HILL, Calhoun, Ky. Filed Aug. 8, 1903. Serial No. 272,266.

Claim.—1. A hame member equipped with a frame-casting having the front and rear walls of its opening flared inward and forward and rearward, respectively, said frame-casting also having upon its outer surface, at the forward edge, apertured outstanding studs, the aperture of one stud being tapered or oblong, a trace or tug hook having an inner bifurcated end, with its thus-formed branches provided also with tapered apertures adapted to register with the aforesaid apertures, said hook also having upon its inner or rear surface a forward and rearward flared cleat let in said opening and adapted to engage the corresponding surfaces or walls thereof, and a pinion equipped with a number of lateral pins or projections having a corresponding outline with said tapered apertures, said pintle being adapted after insertion through said apertured studs and the apertured branches of said hook, to be adjusted or axially manipulated to cause its pins or projections to point in a direction oppositely to that in which initial connection is effected between said frame-casting and said pintle.

2. A frame-casting adapted to be attached to a hame member and having the front and rear walls of its opening flared inward and forward and rearward, respectively, said frame-casting also having upon its outer surface, at the forward edge, apertured outstanding studs, the aperture of one stud being tapered or oblong, a trace or tug hook having an inner bifurcated end with its thus-formed branches provided also with tapered apertures, said hook also having upon its inner or rear surface a forward and rearward flared cleat let into said frame-casting opening and engaging the corresponding walls of the latter, and a pintle equipped with a number of lateral pins or projections of corresponding outline with the apertures of said studs and of said tug-hook branches, and engaging said apertures.

3. A hame member equipped with a frame-casting having the front and rear walls of its opening flared inward and forward and rearward, respectively, said frame-casting also having, upon its outer surface, at its forward edge, outstanding apertured studs, the aperture of one stud being tapered or oblong, a trace or tug hook having, upon its inner or under side, a forward and rearward flared cleat or extension, let into the opening of said frame-casting and engaging the corresponding walls of said opening, said trace-hook having inner or forward end branches provided with tapered apertures and standing outward therefrom, for reception between said studs, and a pintle equipped with a number of lateral tapered pins or projections, said pintle being insertible through the frame-casting studs and the branches of said trace or tug hook, together with its pins or projections, and adjustable or movable so that the latter may point oppositely to the direction in which connection is initially effected between said pintle and said frame-casting studs.

813,295. ADJUSTABLE TRACK OR TROLLEY-WIRE. WALLIS HILLS, Kansas City, Kans. Filed May 6, 1905. Serial No. 259,097.



Claim.—1. An adjustable track consisting of two wires one arranged vertically above the other, and means for adjusting said track both vertically and laterally, substantially as described.

2. An adjustable track consisting of two wires one arranged vertically above the other, rectangular division-plates arranged between said tracks and permanently secured thereto, and means for adjusting said rectangular plates both vertically and laterally, substantially as described.

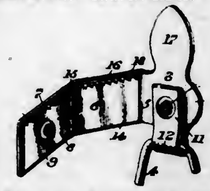
3. An adjustable track consisting of two wires one arranged vertically above the other, rectangular division-plates each of which has two marginal grooves in which said wires are permanently secured, said plates being equal in thickness to the diameter of the wires, and adjustably-supported means to which said division-plates are detachably secured.

4. An adjustable track consisting of two wires one arranged vertically above the other, rectangular division-plates each of which has two marginal grooves in which said wires are permanently secured and a centrally-disposed rectangular opening, a threaded rod having an intermediate rectangular portion to snugly fit the opening and prevent said rod from turning in the division-plate, and means engaging the threaded rod for adjusting the same laterally.

5. The combination with an adjustable track, of a plurality of right-angular members consisting of horizontal portions to which the track is suitably secured and vertical shank portions, and sockets in which said shank portions are adjustably secured.

6. An adjustable track consisting of two wires, rectangular division-plates arranged between and permanently secured to said wires, threaded rods to which said plates are detachably secured, right-angular members having horizontal threaded portions and vertical shanks, turnbuckles engaging said threaded portions and the threaded rods for adjusting the latter laterally, and sockets in which the shanks are adjustably secured.

813,296. SUSPENDER-END. WILLIAM W. HOOPES, Philadelphia, Pa. Filed Mar. 29, 1905. Serial No. 253,610.



Claim.—1. In a device of the character described, a side-opening buckle, a flap therefor, and a tab and loop secured to the flap.

2. In a device of the character described, a side-opening buckle, means for maintaining it in closed position and side-opening jaws secured within the buckle.

3. In a device of the character described, a buckle, a combined cover and closing mechanism therefor and a loop depending from the cover.

4. In a device of the character described, a buckle, rigid jaws within the buckle, a flexible inclosing medium and separable means for securing the latter in inclosing position.

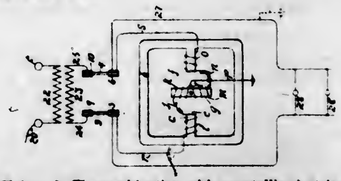
5. In a device of the character described, a web, a surrounding flexible cover separably attached at its free ends, and gripping-jaws connected with said flexible member and engaging the web upon opposite sides thereof.

6. In a device of the character described, a web, a side opening surrounding cover and substantially parallel means attached to said cover engaging the web upon opposite sides thereof.

7. In a device of the character described, a pair of hinged jaws, a surrounding flexible buckle and a flap securing the buckle in closed position.

8. In a device of the character described, rigid gripping means, a surrounding flexible cover and a flap securing the cover in position to maintain the hold of the gripping means.

813,297. ELECTRICAL SAFETY DEVICE. ELWOOD B. HOSMER and WILLIAM N. DIETRICH, Montreal, Canada. Filed June 30, 1905. Serial No. 268,668.



Claim.—1. The combination with a metallic electric circuit to be protected including a switch and means for releasing said switch, and an additional circuit permanently in shunt with said metallic circuit and having a permanent ground connection, said additional circuit including an electromagnet and an armature within the mag-

netic field of said magnet, of mechanical means acted upon by said armature and acting directly upon said means for releasing said switch and opening the circuit to be protected, for the purpose set forth.

2. The combination with an electric circuit to be protected, of an electric safety device comprising an additional circuit in shunt with said circuit, said additional circuit including two electromagnets the relative positions whereof are changeable, means coacting with said electromagnets and actuated upon the said change of position, for opening the said circuit to be protected and a permanent ground connection connected to said shunt-circuit, for the purpose set forth.

3. The combination with an electric circuit to be protected and means for opening said circuit, of an electric safety device comprising a pair of oppositely-wound electromagnets a short distance apart and in line with one another, an oscillatory armature pivotally mounted between the adjacent poles of said electromagnets and having coils wound oppositely to one another upon the ends thereof, a wire connecting the outer terminal of one of the coils of said pair of electromagnets to one terminal of the circuit to be protected, a slack wire connecting the opposite terminal of said last-mentioned coil to the outer terminal of the coil wound oppositely thereto upon one end of the armature, a wire connecting the opposite terminal of the last-mentioned coil to the adjacent terminal of the coil upon the other end of said armature, a slack wire connecting the opposite terminal of the last-mentioned coil to one terminal of the other coil of said pair of electromagnets, a wire connecting the opposite terminal of said last-mentioned coil to the other terminal of the circuit, and means whereby the oscillation of said armature will cause the circuit-opening means to open the circuit, substantially as described and for the purpose set forth.

4. The combination with an electric circuit to be protected and means for opening said circuit, of an electric safety device comprising a pair of oppositely-wound electromagnets a short distance apart and in line with one another, an oscillatory armature pivotally mounted between the adjacent poles of said electromagnets and having coils wound oppositely to one another upon the ends thereof, a wire connecting the outer terminal of one of the coils of said pair of electromagnets to one terminal of the circuit to be protected, a slack wire connecting the opposite terminal of said last-mentioned coil to the outer terminal of the coil wound oppositely thereto upon one end of the armature, a wire connecting the opposite terminal of the last-mentioned coil to the adjacent terminal of the coil upon the other end of said armature, a grounded wire connected to this last-mentioned wire midway of its length, a slack wire connecting the opposite terminal of the last-mentioned coil to one terminal of the other coil of said pair of electromagnets, a wire connecting the opposite terminal of said last-mentioned coil to the terminal of the circuit, and means whereby the oscillation of said armature will cause the circuit-opening means to open the circuit, substantially as described and for the purpose set forth.

5. The combination with an electric circuit and the switch-arm of a spring-actuated multipolar switch included in said circuit, of a latch having a lateral projection, said latch being pivotally connected to the frame of the switch and adapted to engage the switch-arm and retain same in its closed position, a spring tending to disengage said latch from the switch-arm, a detent in the form of a lever fulcrumed near one end to the frame of the switch, the end of the short arm of said lever being concentric to its fulcrum-point and engaging said lateral projection when the long arm of said lever is raised and retaining same, against said last-mentioned spring, in engagement with the switch-arm, a support for retaining said long arm in its raised position, and electrical means for displacing said support and operated, upon emergency, by the current traversing said circuit, substantially as described and for the purpose set forth.

813,298. **HOOP-TRIMMER.** LOUIS J. HEGMAN, Geddes, S. D. Filed Oct. 2, 1905. Serial No. 281,081.

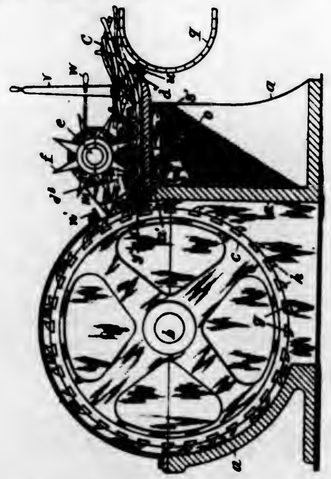
Claim.—1. A device of the character described comprising a base-plate, standards on said base-plate, a rod connecting said standards, a yoke having hooked ends to engage said rod, a knife on said yoke, and means for adjusting said knife.

2. A device of the character described comprising a base-plate, standards carried by said base-plate, a rod connecting said standards, a yoke having hooked ends to engage said rod, a knife on said yoke, and means for adjusting said knife.

813,299. **WATER-WHEEL.** DANIEL HUG, Denver, Colo., assignor to John T. Lund, Denver, Colo. Filed Mar. 29, 1902. Serial No. 100,643. (Model.)

Claim.—A bucket for impact water-wheels comprising side cavities and a central frog, the upper edges of the frog being overhung and the front edge or apex thereof being straight, rising from about the middle of the floor of the bucket, and being inclined slightly backward, the floor of the bucket inclining upwardly and forwardly from the bottom point of the frog to a horizontal straight lip, said upwardly-inclining portion being bounded by the side walls of the bucket, the side walls extending backwardly from the lip each in reverse curves and merging with the frog, the upper surfaces of the frog and side walls and the lip being in the same plane.

813,300. **DISINTEGRATING-MACHINE.** JOHN W. HYATT, Newark, N. J., assignor to Frank S. Warmoth, Lawrence, La. Filed May 3, 1905. Serial No. 258,701.



Claim.—1. In a disintegrating-machine, the combination, with the cutter-drum having teeth projected therefrom, of the feeding-table *d*, the shaft *s* over said table with feed-wheels *f* thereon, and dogs *m* operating as strippers for the teeth of the feed-wheels and thickened at their forward ends to form a continuous presser on the surface of the cane, and the drum having the cover *s* with opening into which the thickened edges of the dogs extend close to the path of the cutter-teeth.

2. In a disintegrating-machine, the combination, with the cutter-drum having teeth projected therefrom, of a feeding-table, the shaft *s* over said table with feed-wheels *f* thereon, and dogs *m* journaled upon the said shaft between the teeth of the feed-wheels, and operating as strippers for said teeth, the dogs being projected beyond the ends of the feeding-teeth and thickened to contact with one another to form a continuous presser on the surface of the cane, and the drum having the cover *s* with opening into which the thickened edges of the dogs extend close to the path of the cutter-teeth.

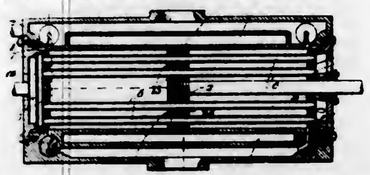
3. In a disintegrating-machine, the combination, with the cutter-drum having teeth projected therefrom, of the stationary feeding-table *d* inclined toward the drum and having its outer edge elevated and its inner edge provided on the under side with an inclined adjustable plate to compensate for wear, whereby the juice expressed from the cane is prevented from escape and is mingled with the disintegrated material, substantially as herein set forth.

4. In a disintegrating-machine, the combination, with the cutter-drum having teeth projected therefrom, of the feeding-table *d* inclined toward the drum and having its forward edge beveled upon its under side, and the plate *p* fitted to such bevel and supported adjustably to sustain the material adjacent to the cutters, with a longitudinal packing between the plate and the under side of the table to prevent the escape of the juice discharged from the material backwardly along such plate.

5. In a disintegrating-machine, the combination, with a cutter-drum having teeth projected therefrom, of a feeding-table adjacent to the edge of the drum, and having its outer edge curved upwardly as set forth, a carrier for delivering the material to the outer edge of the table, a movable stop to close the space between the carrier and such edge of the table, and means for supporting the stop when in operation and for withdrawing it to clear such space when it becomes clogged.

6. In a disintegrating-machine, the combination, with a cutter-drum having teeth projected therefrom, of a feeding-table adjacent to the edge of the drum with a shaft supported above the table and a series of star feed-wheels attached to such shaft, a series of weighted dogs journaled loosely to the shaft between the said wheels and extended to the forward edge of the table, and a stop above the forward ends of the dogs to limit their upward movement, the whole arranged and operated as and for the purpose set forth.

813,301. **STEAM-ENGINE.** FRANK S. HYDE, Riverside, Cal. Filed Sept. 9, 1903. Renewed July 13, 1905. Serial No. 269,571.



Claim.—1. In combination with a chamber for confining an expansive fluid, and a movable wall therein, of means for passing a temperature-influencing agent in segregated paths traversing the chamber.

2. In combination with a chamber for confining an expansive fluid, and a movable wall therein, of means for passing a temperature-influencing agent in segregated paths traversing the chamber and through the walls of the chamber.

3. In combination with a chamber for confining an expansive fluid, and a movable wall therein, of a stationary tube extending through the chamber and the movable wall exteriorly of the piston-rod for conveying a temperature-influencing agent.

4. In combination with a chamber for confining an expansive fluid, and a movable wall therein, of means for conveying a temperature-influencing agent in segregated paths traversing the chamber, and means for causing a circulation of the said agent through the conveying means.

5. In combination with a chamber for confining an expansive fluid, and a movable wall therein, of a series of tubes extending through the chamber, and means for introducing a temperature-influencing agent to the tubes.

6. In combination with a chamber for confining an expansive fluid, and a movable wall therein, of a series of tubes extending through the chamber and through the movable wall, and means for introducing a temperature-influencing agent to the tubes.

7. A cylinder, a piston therein with its piston-rod, and a stationary tube lying in the cylinder exteriorly of the piston-rod.

8. A cylinder, a piston therein, and a series of tubes extending through the cylinder and piston, exteriorly of the piston-rod.

9. A cylinder, a piston therein, and a series of tubes extending through the cylinder and piston and suitable packing around the tubes where they pass through the piston.

10. A cylinder, a piston therein, a series of tubes extending through the cylinder and piston, the cylinder-wall having a chamber communicating with the tubes, and means for circulating a temperature-influencing agent through the tubes and chamber.

11. A cylinder, a piston therein, heads in the ends of the cylinder having tapered holes, and a series of tubes with tapered ends supported by the heads.

12. A cylinder, a piston therein, detachable heads in the ends of the cylinder having tapered holes, and a series of tubes with tapered ends supported by the heads.

13. A cylinder, a piston therein, an end of the cylinder having a chamber, a series of tubes extending through the cylinder and piston and communicating with the chamber, a supply-passage for said chamber, and a screen between the supply-passage and the ends of the tubes.

14. A cylinder, a piston therein, a series of tubes extending through the cylinder and piston, said piston being perforated to receive the tubes and having annular recesses around the perforations on each side of the piston, annular packing-rings nested in the recesses, and plates secured to the piston and confining the packing-rings.

15. A cylinder, a piston therein, a series of tubes extending through the cylinder and piston, said piston being perforated to receive the tubes and having annular recesses around the perforations on each side of the piston, annular packing-rings nested in the recesses, plates secured to the piston and confining the packing-rings, the recesses being larger than the packing-rings to allow side movement of the same.

16. A cylinder the head end of which has a chamber, an inlet-pipe for said chamber, a piston in the cylinder, a series of tubes extending through the cylinder and piston, the cylinder having a chamber in the crank end, the tubes communicating with both said chambers, the cylinder having an annular chamber which communicates with the chamber in the crank end, and an outlet-pipe in the head end of the cylinder communicating with the annular chamber.

17. In combination, a chamber for confining an expansive fluid, a movable wall therein, means for conveying a temperature-influencing agent through the chamber, means for supplying a temperature-influencing agent connected with the said conveying means, and means for circulating said temperature-influencing agent.

18. In combination, a chamber for confining an expansive fluid, a movable wall therein, means for conveying a temperature-influencing agent through the chamber, means for supplying a temperature-influencing agent connected with the said conveying means, means for circulating said temperature-influencing agent, and means for increasing or decreasing the temperature of the said agent.

19. In combination, a cylinder, a piston therein, a series of tubes extending through the cylinder and piston, a water-heater, and piping connecting the water-heater and tubes.

20. In combination, a cylinder, a piston therein, a series of tubes extending through the cylinder and piston, a water-heater, piping connecting the water-heater and tubes, and a circulator connected between the water-heater and tubes.

21. In combination, a cylinder, a piston therein, a series of tubes extending through the cylinder and piston, a water-heater, piping connecting the water-heater and tubes, and a circulator connected between the water-heater and tubes comprising a chamber, and a propeller in the chamber.

22. In combination, a cylinder, a piston therein, a series of tubes extending through the cylinder and piston, a water-heater, piping connecting the water-heater and tubes, a circulator connected between the water-heater and tubes, and a superheater intermediate the water-heater and tubes.

23. In combination, a cylinder and its piston, means for conveying a temperature-influencing agent in definite paths through the space in the cylinder at either side of the piston for promoting uniformity of temperature.

24. In combination, a cylinder and its piston, a series of tubes traversing the space in the cylinder at either side of the piston.

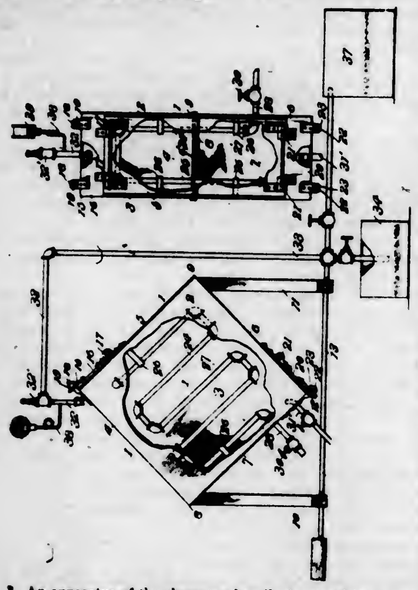
25. A working cylinder, a piston therein, tubes fixed to the cylinder and extending therethrough and through the piston, and means for moving heat-conducting fluid through said tubes.

813,302. **APPARATUS FOR DISTILLING WOOD AND OBTAINING THEREFROM THE DIFFERENT BY-PRODUCTS.** WALTER W. JAMES and THOMAS L. JAMES, Rawlins Springs, Miss. Filed July 6, 1905. Serial No. 268,220.

Claim.—1. An apparatus of the character described, comprising an angular box-like retort mounted at diagonally opposite corners in a horizontal plane, and steam-coils supported by the sides of the retort, a steam-supply pipe in communication with said retort, the upper and lower diagonally opposite corners having charging and discharging openings respectively.

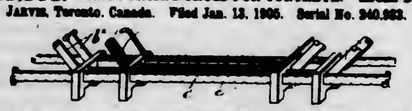
2. An apparatus of the character described, comprising a rectangular retort having its diagonally opposite corners mounted in standards in a horizontal plane, steam-coils vertically disposed within

the retort, adjacent the vertically-disposed sides and forming a central space between the same for the reception of the wood to be distilled, a charging-opening adjacent the upper corner, and a discharging-opening carried by the lower diagonally opposite corners and doors for closing said openings.



3. An apparatus of the character described, comprising a rectangular retort having its diagonally opposite corners mounted in standards in a horizontal plane, steam-coils vertically disposed within the retort adjacent the vertically-disposed sides and forming a central space between the same for the reception of the wood to be distilled, a steam-supply pipe in direct communication with said retort, a discharge-pipe in communication with the upper end of said retort, a puppet-valve within said pipe, and charging and discharging doors carried by the diagonally opposite upper and lower corners.

813,803. REINFORCING-TRUSS FOR CONCRETE. EDGAR B. JARVIS, Toronto, Canada. Filed Jan. 13, 1905. Serial No. 240,983.



Claim.—1. In a truss for concrete beams and the like, the combination with the central bar provided with obliquely-set ends, of the side bars provided with obliquely-set ends and located on each side and extending beyond each end of the central bar, perforated clamps permanently carried by the bars and through which the bars extend for holding the bars separated and from lateral and longitudinal displacement as and for the purpose specified.

2. In a truss for concrete beams and the like, the combination with the central bar provided with obliquely-set ends, of the side bars provided with obliquely-set ends and located on each side and extending beyond the central bar, and clamps molded onto the bars and designed to hold them separated and from lateral and longitudinal displacement said molded clamps extending transversely of the side bars and central bar and forming the sole connection between them as and for the purpose specified.

3. In a truss for concrete beams and the like, the combination with the central bar provided with obliquely-set ends, of the side bars provided with obliquely-set ends and located on each side and extending beyond each end of the central bar, and clamps molded onto the bars and obliquely-shaped ends and designed to hold them separated and from lateral longitudinal displacement said molded clamps extending transversely of the side bars and central bar and forming the sole connection between them as and for the purpose specified.

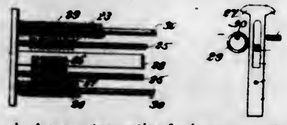
4. In a truss for concrete beams and the like, the combination with the central bar provided with obliquely-set ends, of the side bars provided with obliquely-set ends and located on each side and extending beyond each end of the central bar, the said bars being provided with nicks on their edges and clamps molded onto the bars and designed to hold them separated and from lateral and longitudinal displacement said molded clamps extending transversely of the side bars and central bar and forming the sole connection between them as and for the purpose specified.

5. In a truss for concrete beams and the like, the combination with the central bar provided with obliquely-set ends, of the side bars provided with obliquely-set ends and located on each side and extending beyond each end of the central bar, clamps through which the bars extend for holding the bars separated and from lateral and longitudinal displacement, and supplemental side bars located on each side of the aforesaid bars and extending beyond the obliquely-set ends of the aforesaid bars and clamps through which the bars extend for holding the bars separated and from lateral and longitudinal displacement as and for the purpose specified.

6. In a reinforcing-truss for concrete and the like, the combination with a plurality of bars placed side by side and having nicked or roughened surfaces, of a block or clamp cast around the bars, so that the metal will flow into the nicks as and for the purpose specified.

7. In a reinforcing-truss for concrete and the like, the combination with a plurality of bars placed side by side and having nicked or roughened surfaces, of a block or clamp cast around the bars, so that the metal will flow into the nicks, and a supplemental bar extending from the cast block or clamp as and for the purpose specified.

813,804. WARP STOP-MOTION FOR LOOMS. ALLAN A. JOHNSON, Central Falls, R. I., assignor to Kip-Armstrong Company, New York, N. Y., a Corporation of New York. Filed June 10, 1905. Serial No. 264,656.



Claim.—1. A warp stop-motion for looms comprising drop devices supported in normal position by unbroken warp-threads, a normally open electric circuit adapted to be closed through its terminals by contact therewith of a fallen drop, and means to hold a drop in its fallen position when a warp-thread breaks or becomes unduly slack so as to prevent an interruption of the circuit for a definite period.

2. A warp stop-motion for looms comprising drop devices supported in normal position by unbroken warp-threads, a normally open electric circuit adapted to be closed through its terminals by contact therewith of a fallen drop, one of said terminals having means to hold a drop in its fallen position when a warp-thread breaks or becomes unduly slack.

3. A warp stop-motion for looms comprising drop devices supported in normal position by unbroken warp-threads, a normally open electric circuit adapted to be closed through its terminals by contact therewith of a fallen drop, one of said terminals having means adapted to grip a drop laterally and hold it in its fallen position when a warp-thread breaks or becomes unduly slack.

4. A warp stop-motion for looms comprising drop devices supported in normal position by unbroken warp-threads, a normally open electric circuit adapted to be closed through its terminals by contact therewith of a fallen drop, said terminals being above the plane of the warps and one of them having means to hold a drop in its fallen position when a warp-thread breaks or becomes unduly slack.

5. A warp stop-motion for looms comprising drop devices supported in normal position by unbroken warp-threads, a normally open electric circuit adapted to be closed through its terminals by contact therewith of a fallen drop, one of said terminals being formed of separable yielding sections between which the drop is adapted to be held when a warp-thread breaks or becomes unduly slack.

6. A warp stop-motion for looms comprising drop devices supported in normal position by unbroken warp-threads, a normally open electric circuit adapted to be closed through its terminals by contact therewith of a fallen drop, one of said terminals consisting of a coiled spring between the convolutions of which the drops are adapted to enter when a warp-thread breaks or becomes unduly slack.

7. A warp stop-motion for looms comprising drop devices supported in normal position by unbroken warp-threads, a normally open electric circuit adapted to be closed through its terminals by contact therewith of a fallen drop, said drop devices having slots therein through which one of said terminals is adapted to pass, the other terminal being supported outside of the drops, one of said terminals having means to hold a drop in its fallen position when a warp-thread breaks or becomes unduly slack.

8. A warp stop-motion for looms comprising drop devices supported in normal position by unbroken warp-threads, a normally open electric circuit adapted to be closed through its terminals by contact therewith of a fallen drop, a projection extending from said drops adapted to engage and be held by one of said terminals when a drop falls.

9. A warp stop-motion for looms comprising drop devices supported in normal position by unbroken warp-threads, a normally open electric circuit having terminals extending transversely of the warps, said drop devices having a projection extending from the body thereof and adapted to contact with one of said terminals which lies outside the path of descent of the body of the drop, and one of said terminals having means to hold a drop in its fallen position when a warp-thread breaks or becomes unduly slack.

10. A warp stop-motion for looms comprising drop devices supported in normal position by unbroken warp-threads, a normally open electric circuit adapted to be closed through its terminals by contact therewith of a fallen drop, said drop devices being formed of sheet metal having a longitudinally-slotted body with a contact projection extending therefrom, one of said circuit-terminals having means to hold a drop in its fallen position when a warp-thread breaks or becomes unduly slack.

11. A warp stop-motion for looms comprising drop devices supported in normal position by unbroken warp-threads, a normally open electric circuit adapted to be closed through its terminals by contact therewith of a fallen drop, said drop devices being formed of sheet metal having an elongated body provided with two slots therein one of which is open at one end and the other closed at both ends, and one of said circuit-terminals having means to hold a drop in its fallen position when a warp-thread breaks or becomes unduly slack.

12. A warp stop-motion for looms comprising drop devices supported in normal position by unbroken warp-threads, a normally open electric circuit adapted to be closed through its terminals by contact therewith of a fallen drop, said drop devices being formed of sheet metal having an elongated body provided with two slots therein one of which is open at one end and the other closed at both ends, one of said circuit-terminals passing through the closed slots and serving also as a guide for the drops, and one of the terminals having means to hold a drop in its fallen position when a warp-thread breaks or becomes unduly slack.

13. A warp stop-motion for looms comprising drop devices supported in normal position by unbroken warp-threads, a normally open electric circuit adapted to be closed through its terminals by contact therewith of a fallen drop, said drop devices being formed of sheet metal having an elongated body provided with two slots therein one of which is open at one end and the other closed at both ends, a contact projection extending from the body of the drop, one of said circuit-terminals passing through the closed slots and serving also as a guide for the drops, and the other terminal lying outside the path of descent of the body of a falling drop and adapted to receive and hold the drop by said projection when a warp-thread breaks or becomes unduly slack.

14. A warp stop-motion for looms comprising drop devices supported in normal position by unbroken warp-threads, a normally open electric circuit adapted to be closed through its terminals by contact therewith of a fallen drop, said drop devices having a projection extending from the body thereof above the warp and adapted to contact with one of the circuit-terminals, the point of contact of said terminal and projection being outside the path of descent of the body of the drop, and one of said terminals having means to hold a drop in its fallen position when a warp-thread breaks or becomes unduly slack.

15. A warp stop-motion for looms comprising drop devices supported in normal position by unbroken warp-threads, a normally open electric circuit adapted to be closed through its terminals by contact therewith of a fallen drop said circuit-terminals extending transversely of the warps, said drop devices being arranged in banks or groups between adjacent circuit-terminals and each drop having a contact projection, one of said terminals having means to hold a drop in its fallen position when a warp-thread breaks or becomes unduly slack.

16. A warp stop-motion for looms comprising drop devices supported in normal position by unbroken warp-threads, a normally open electric circuit adapted to be closed through its terminals by contact therewith of a fallen drop said circuit-terminals extending transversely of the warps and one of them arranged between adjacent banks or groups of drop devices and having means to hold a drop in its fallen position, and a projection extending from the body of the drop and adapted to contact with and be held by said terminal when a warp-thread breaks or becomes unduly slack.

17. A warp stop-motion for looms comprising drop devices supported in normal position by unbroken warp-threads, a normally open electric circuit having terminals extending transversely of the warps and lying outside the path of descent of the body of a falling drop, said drop devices having projections extending from the body thereof adapted to contact with said terminals, one of said terminals having means to hold a drop in its fallen position when a warp-thread breaks or becomes unduly slack.

813,805. SUPPLY AND EXHAUST VALVE MECHANISM FOR MOTORS. WILBUR H. JOHNSON, Cumberland, Md. Filed July 5, 1903. Serial No. 164,626.

Claim.—1. In a motor, the combination of a motor, a piston operating therein, a fluid-supply pipe, a controlling-valve in said pipe, reciprocating means governed by the piston for periodically operating said valve, an exhaust-valve in the supply-pipe controlling the exhaust of spent fluid from the motor to the atmosphere, and means of which the first-mentioned means form a part for operating the exhaust-valve alternately with the said controlling-valve.

2. In a motor, the combination of a motor-cylinder, a piston operating therein, a supply-pipe for an impelling fluid, a controlling-valve in said pipe, an exhaust-valve in the pipe operated alternately with the controlling-valve to control the supply and exhaust of the impelling medium, a reciprocating rod operatively connected with the controlling-valve, a second rod connected with the piston-rod and operating said reciprocating rod to periodically open and close said controlling-valve, and means governed by the piston for controlling the exhaust-valve, substantially as described.

3. In a motor, the combination of a motor-cylinder, a piston operating therein, a supply and exhaust pipe, a controlling-valve in said pipe governing the supply of the impelling medium to the cylinder, an exhaust-valve slidably mounted in the pipe, an arm or contact device on the piston-rod, means operated by said arm or contact device to actuate the controlling-valve, an arm connected to the stem of the exhaust-valve and slidably connected to the piston-rod, said arm being engaged by the first-named arm or contact device upon the return stroke of the piston to close the exhaust-valve, and a second contact device on the piston-rod adapted upon the outstroke of the

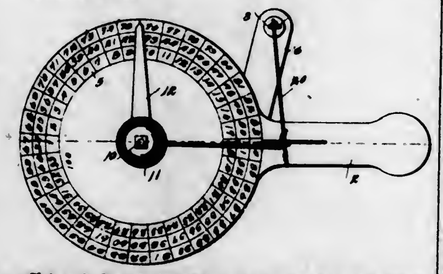
piston to engage said sliding arm and open the exhaust-valve, substantially as described.

4. In a motor, the combination with a motor-cylinder, and a piston operating therein, a valve controlling the inlet of a fluid-impelling agent to the cylinder, a reciprocating rod operated by the piston, a second reciprocating rod, a link connecting said second reciprocating rod with the valve, and controlling connections periodically operating under the action of the first-named reciprocating rod to successively transfer motion to the other reciprocating rod to actuate said link to open and close the valve.

5. In a motor, the combination with a motor-cylinder and a piston operating therein, of a fluid-supply valve, a reciprocating rod operatively connected to the piston, said rod being provided with spaced tappet devices, a second reciprocating rod, a link connecting said second reciprocating rod with the valve, and a throw-lever pivotally connected with the second reciprocating rod and adapted to be engaged by said tappet devices to transfer motion to said rod and link to open and close the valve.

6. In a motor, the combination with a motor-cylinder and a piston operating therein, of a supply and exhaust pipe, a rotary supply-valve in said pipe, a sliding exhaust-valve in the pipe, a reciprocating rod, an arm rigidly connecting one end of said rod with the piston-rod, the opposite end of said rod being provided with spaced striker-pins, an arm rigidly connected to the stem of the exhaust-valve and slidably connected with the piston-rod and adapted to be engaged by the arm of the reciprocating rod on the return stroke of the piston to close the valve, a projection on the piston-rod adapted to engage said sliding arm upon the outstroke of the piston to open the exhaust-valve, a second reciprocating rod, a link connecting said second reciprocating rod with the rotary supply-valve, and a pivoted throw-lever connected with the first reciprocating rod and adapted to be engaged by said spaced striker-pins on the second reciprocating rod to open and close the supply-valve alternately with the exhaust-valve on opposite strokes of the piston, substantially as described.

818,306. TOY. IRA KINMAN, Pearl City, Ill. Filed Sept. 30, 1905. Serial No. 280,805.



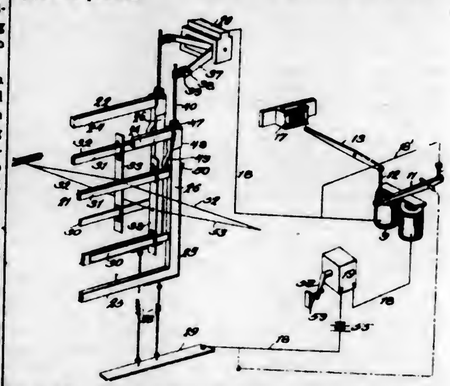
Claim.—1. In a device of the class described, a dial bearing characters on its face, a pointer rotatively mounted on the dial for travel thereover, an arm connected with the pointer, a pivoted trigger designed for engagement with the arm to hold the pointer against movement, a spring-tensioned element adapted to act upon and for imparting movement to the pointer, and means for varying the tension of the element.

2. In a device of the class described, a dial bearing characters on its face, a pointer rotatively mounted on the dial for travel thereover, an arm connected at one end with and projecting from the pointer, a trigger designed to engage the arm for holding the pointer against movement, a clamping member sustained at a point remote from the trigger and adapted for rotation, and an elastic element engaged with the clamping member and adapted for engagement with the arm.

818,307. WARP STOP-MOTION FOR LOOMS. FREDERIC H. KIP, Montclair, N. J., and FREDERIC M. ARMSTRONG, Pawtucket, R. I., assignors to Kip-Armstrong Company, New York, N. Y., a Corporation of New York. Filed Mar. 3, 1905. Serial No. 248,261.

Claim.—1. In a warp stop-motion for looms the combination of a controlling-circuit for setting in operation the stopping mechanism, a harness-frame having a series of heddles suspended therein, a switch included in said circuit and located outside of said frame, and means to close the circuit at said switch when the frame is at or near its lowermost position.

2. In a warp stop-motion for looms the combination of a controlling-circuit for setting in operation the stopping mechanism, a harness-frame having a series of heddles suspended therein, a switch included in said circuit and located outside of said frame, and means to break the circuit at said switch when the frame is at or near its uppermost position.



3. In a warp stop-motion for looms the combination of a controlling-circuit for setting in operation the stopping mechanism, a harness-frame having a series of heddles suspended therein, a switch included in said circuit and located outside of said frame, and means to alternately close and break the circuit at said switch as the frame is at or near its lowermost and uppermost positions respectively.

4. In a warp stop-motion for looms the combination of a controlling-circuit for setting in operation the stopping mechanism, a plurality of harness-frames each having a series of heddles suspended therein, a switch included in said circuit and electrically connected to each of the harness-frames, and means to alternately close and break the circuit at said switch for each frame as it is at or near its lowermost and uppermost positions respectively.

5. In a warp stop-motion for looms the combination of a controlling-circuit for setting in operation the stopping mechanism, a harness-frame having a series of heddles suspended therein, a switch included in said circuit and located outside of said frame, and means to operate said switch in synchronism with the movement of said frame so as to alternately close and break the circuit at said switch when the frame is at or near its lowermost and uppermost positions respectively.

6. In a warp stop-motion for looms the combination of a controlling-circuit for setting in operation the stopping mechanism, a harness-frame having a series of heddles suspended therein, a switch included in said circuit and located outside of said frame, a connection between said frame and said switch whereby the latter is controlled to alternately close and break the circuit when the frame is at or near its lowermost and uppermost positions respectively.

7. A warp stop-motion for looms comprising a controlling-circuit for setting in operation the stopping mechanism, a harness-frame having a heddle-supporting bar secured therein said bar being included in said circuit, and means comprising a gravity drop device for closing the circuit through said bar when a warp-thread breaks or becomes unduly slack.

8. A warp stop-motion for looms comprising a controlling-circuit for setting in operation the stopping mechanism, a harness-frame having a heddle-supporting bar secured therein above the warp said bar being included in said circuit, and means comprising a gravity drop device for closing the circuit through said bar when a warp-thread breaks or becomes unduly slack.

9. In a warp stop-motion for looms the combination of a controlling-circuit for setting in operation the stopping mechanism, a harness-frame carrying a fixed contact-bar said bar being included in said circuit, a series of heddles suspended on said bar, said circuit being closed through said bar by the falling of a heddle when a warp-thread breaks or becomes unduly slack to set in operation the stopping mechanism.

10. In a warp stop-motion for looms the combination of a controlling-circuit for setting in operation the stopping mechanism, a harness-frame carrying a fixed contact-bar, said bar comprising two members insulated from each other the terminals of said circuit being electrically connected respectively to said members, a series of heddles suspended on said bar, said circuit being adapted to be closed through said bar when a warp-thread breaks or becomes unduly slack to set in operation the stopping mechanism.

11. A warp stop-motion for looms comprising a controlling-circuit for setting in operation the stopping mechanism, a harness-frame having a heddle-supporting bar included in said circuit, heddles having slots through which said bar is passed, said circuit being closed through said bar by the falling of a heddle when a warp-thread breaks or becomes unduly slack to set in operation the stopping mechanism.

12. A warp stop-motion for looms comprising a controlling-circuit for setting in operation the stopping mechanism, a harness-frame having a heddle-supporting bar included in said circuit, heddles having slots through which said bar is passed, the point of suspension of said heddles being above the warp, said circuit being closed through said bar by the falling of a heddle when a warp-thread breaks or becomes unduly slack to set in operation the stopping mechanism.

13. A warp stop-motion for looms comprising a controlling-circuit for setting in operation the stopping mechanism, a harness-frame having a series of heddles therein, a supporting-bar for said heddles secured to the frame and included in said circuit, the tension of the warp-threads on the heddles during the normal operation of the loom alternately closing and breaking the circuit through said supporting-bar when the harness-frame is at or near its uppermost and lowermost positions respectively, said circuit also being closed through said bar by the falling of a heddle when a warp-thread breaks or becomes unduly slack to set in operation the stopping mechanism.

14. In a warp stop-motion for looms the combination of a controlling-circuit for setting in operation the stopping mechanism, a harness-frame to which the terminals of said circuit are electrically connected, a bar electrically connected to said frame and carried thereby, and metallic heddles suspended in said frame and adapted when fallen to contact with said bar to close the circuit.

15. In a warp stop-motion for looms the combination of a controlling-circuit for setting in operation the stopping mechanism, a harness-frame having a series of heddles suspended therein, said harness-frame being included in said circuit and means operative during the normal running of the loom to close said circuit at a point outside of said frame when said frame is at or near its lowermost position and at the same time to break the circuit through one of the heddle-supporting bars.

16. In a warp stop-motion for looms the combination of a controlling-circuit for setting in operation the stopping mechanism, a harness-frame having a series of heddles suspended therein, said harness-frame being included in said circuit and means operative during the normal running of the loom to break said circuit at a point outside of said frame when said frame is at or near its uppermost position and at the same time to close the circuit through one of the heddle-supporting bars.

17. In a warp stop-motion for looms the combination of a controlling-circuit for setting in operation the stopping mechanism, a harness-frame having a series of heddles suspended therein, said frame being included in said circuit, a switch also included in said circuit and located outside of said frame and means operative during the normal running of the loom to close the circuit at said switch when it is broken at a point within the harness-frame.

18. In a warp stop-motion for looms the combination of a controlling-circuit for setting in operation the stopping mechanism, a harness-frame carrying a fixed contact-bar, a series of heddles suspended on said bar, said heddles being controlled by the tension of the warp-threads during the normal running of the loom to close and break the circuit through said bar when the frame is at or near its uppermost and lowermost positions respectively, and means to close and break said circuit at a point outside of the frame at the time when it is broken and closed at said bar respectively.

19. In a warp stop-motion for looms the combination of a controlling-circuit for setting in operation the stopping mechanism, a harness-frame carrying a fixed contact-bar said bar being included in said circuit, a series of heddles suspended on said bar and controlled by the tension of the warp-threads to break and close the circuit when the frame is at or near its lower and upper most positions respectively, a switch located outside of said frame, and means to operate said switch in synchronism with said frame so that during the normal running of the loom the said circuit will be closed at the switch when it is broken at said terminal and broken at the switch when closed at said terminal.

20. A warp stop-motion for looms comprising a controlling-circuit for setting in operation the stopping mechanism, said circuit having two points at which it is alternately broken and closed during the normal running of the loom, one such point being within the harness-frame and the other outside thereof, and means to close the circuit at said outside point only when the frame is at or near its lower most position.

21. A warp stop-motion for looms comprising a controlling-circuit for setting in operation the stopping mechanism, a harness-frame carrying a fixed contact-bar, said bar comprising a body member and a blade insulated from said member and projecting above the same, a series of heddles suspended on said bar, said circuit being adapted to be closed through said bar when a warp-thread breaks or becomes unduly slack to set in operation the stopping mechanism.

22. A warp stop-motion for looms comprising a controlling-circuit for setting in operation the stopping mechanism, a harness-frame carrying a fixed contact-bar, said bar comprising a body member and a blade insulated from said member, a series of heddles supported on said bar, a switch located outside of said frame and means to actuate the same to establish an electrical connection between the switch and said blade when the said frame is at or near its lowermost position, whereby said circuit will be completed by a fallen heddle contacting with said blade when the frame reaches said position.

23. A warp stop-motion for looms comprising a controlling-circuit for setting in operation the stopping mechanism, a harness-frame carrying a fixed contact-bar, said bar comprising a body member and a blade insulated from said member, a series of metallic heddles suspended on said bar, a switch to which one terminal of said circuit is connected located outside of said frame, an electrical connection between said switch and said blade, a plate on said frame of conductive material to which the other terminal of said circuit and said body member are connected, the said parts being so arranged that the circuit will be closed through said switch and said bar at the same time only when the frame is at or near its lowermost position.

24. A warp stop-motion for looms comprising a controlling-circuit for setting in operation the loom-stopping mechanism, a plurality of harness-frames, a switch having a plurality of levers included in said circuit and each harness-frame having connected thereto a corresponding switch-lever and each lever having a contact and a non-conducting face, and contact-fingers to which one terminal of said circuit is connected, the parts being so arranged that the circuit will be closed through said switch for a given frame only when said frame is at or near its lowermost position.

25. In a warp stop-motion for looms the combination of a controlling-circuit for setting in operation the stopping mechanism, means for closing said circuit when a warp-thread breaks or becomes unduly slack, an electromagnet included in said circuit, a dagger connected to the armature of said magnet and means to hold said armature in its attracted position until after the loom has been knocked off.

26. In a warp stop-motion for looms the combination of a controlling-circuit for setting in operation the stopping mechanism, means for closing said circuit when a warp-thread breaks or becomes unduly slack, an electromagnet included in said circuit, a dagger connected to the armature of said magnet, and a shunt-circuit adapted to be closed by said armature to maintain the coils of the electromagnet energized until after the loom has been knocked off.

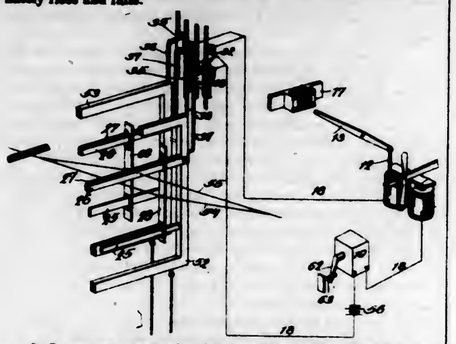
27. In a warp stop-motion for looms the combination of a controlling-circuit for setting in operation the stopping mechanism, a shipper-lever, an electromagnet and a contact-switch included in said circuit, a dagger connected to the armature of said magnet, means to hold said armature in its attracted position until after the shipper-lever has been released, and means on the shipper-lever to operate said cut-out switch to break the circuit after said lever has been released.

818,308. WARP STOP-MOTION FOR LOOMS. FREDERIC H. KIP, Montclair, N. J., and ELMER GREENWOOD, Bridgeport, Conn., assignors to Kip-Armstrong Company, New York, N. Y., a Corporation of New York. Filed Mar. 3, 1905. Serial No. 248,262.

Claim.—1. In a warp stop-motion for looms the combination of a controlling-circuit for setting in operation the stopping mechanism, a harness-frame having a series of heddles suspended therein, a switch comprising plates to which the terminals of said circuit are connected and shoes carried by the harness-frame and adapted to break and close the circuit at said plates as the frame alternately rises and falls.

2. In a warp stop-motion for looms the combination of a controlling-circuit for setting in operation the stopping mechanism, a harness-frame having a series of heddles suspended therein, a switch comprising plates to which the terminals of said circuit are connect-

ed, a slide-block having shoes connected to said frame and adapted to break and close the circuit through said plates as the frame alternately rises and falls.



3. In a warp stop-motion for looms the combination of a controlling-circuit for setting in operation the stopping mechanism, a harness-frame having a fixed contact-bar secured thereto, a series of heddles suspended on said bar, a switch comprising plates to which the terminals of said circuit are connected and shoes carried by the harness-frame and electrically connected to said bar, said shoes being adapted to break and close the circuit through said plates as the frame alternately rises and falls.

4. In a warp stop-motion for looms the combination of a controlling-circuit for setting in operation the stopping mechanism, a harness-frame having a fixed contact-bar secured thereto, said bar comprising two members insulated from each other, a series of heddles suspended on said bar, a switch comprising plates to which the terminals of said circuit are connected, shoes carried by said frame and connected respectively to the members of said bar, said shoes being adapted to break and close the circuit through said plates as the frame alternately rises and falls.

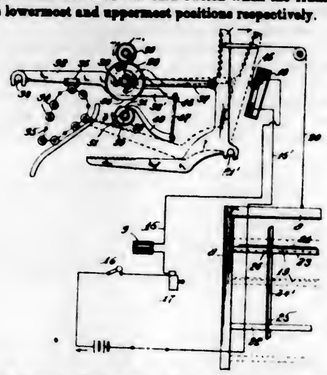
5. In a warp stop-motion for looms the combination of a controlling-circuit for setting in operation the stopping mechanism, a harness-frame having a fixed contact-bar secured thereto, said bar comprising two members insulated from each other, a series of heddles suspended on said bar, rods of conductive material secured to the members of said bar and carrying shoes at their upper ends, contact-plates located outside of said frame and to which the circuit-wires are connected, the parts being so related to each other that during the normal running of the loom the circuit will be closed through said plates by contact of the shoes therewith only when the harness-frame is at or near its lowermost position the tension of the warp-threads at such times on the heddles serving to break the circuit at said contact-bar.

6. In a warp stop-motion for looms the combination of a controlling-circuit for setting in operation the stopping mechanism, a harness-frame having a fixed contact-bar secured thereto, said bar comprising two members insulated from each other, a series of heddles suspended on said bar, rods of conductive material secured to the members of said bar and carrying shoes at their upper ends, a support of insulating material having vertical bars, said shoes being carried by blocks supported between said guide-bars, contact-plates secured to said support and to which the circuit-wires are connected, whereby during the normal running of the loom as the frame is raised and lowered the circuit will be closed and broken alternately at said plates.

813,309. WARP STOP-MOTION FOR LOOMS. FREDERIC B. KIP, Montclair, N. J., and EDWIN C. SAYER, Central Falls, R. I., assignors to Kip-Armstrong Company, New York, N. Y., a Corporation of New York. Filed Oct. 27, 1905. Serial No. 284,662.

Claim.—1. In a warp stop-motion for looms the combination of a controlling-circuit for setting in operation the stopping mechanism, a harness-frame having a series of heddles suspended therein, a switch included in said circuit, pattern-forming mechanism, and means actuated directly by said pattern-forming mechanism for controlling the opening and closing of said switch.

2. In a warp stop-motion for looms the combination of a controlling-circuit for setting in operation the stopping mechanism, a harness-frame having a series of heddles suspended therein, a switch included in said circuit, pattern-forming mechanism, and means actuated directly by said pattern-forming mechanism to alternately close and break the circuit at said switch when the frame is at or near its lowermost and uppermost positions respectively.



3. In a warp stop-motion for looms the combination of a controlling-circuit for setting in operation the stopping mechanism, a plurality of harness-frames each having a series of heddles therein, circuit-wires leading to each of said frames, a switch included in said circuit comprising contacts corresponding to the harness-frames, pattern-forming mechanism, and means actuated directly by said pattern-forming mechanism for closing the circuit through those contacts of which the corresponding frames are at or near their lowermost positions, and breaking the circuit through those contacts of which the corresponding frames are at or near their uppermost positions.

4. In a warp stop-motion for looms the combination of a controlling-circuit for setting in operation the stopping mechanism, a harness-frame carrying a contact-bar, said bar being included in said circuit, a series of heddles suspended on said bar and controlled by the tension of the warp-threads to break and close the circuit thereat when the frame is at or near its lowermost and uppermost positions respectively, a switch included in said circuit, and pattern-forming mechanism for directly controlling said switch so that during the normal running of the loom the circuit will be closed at the switch when it is broken at said terminal and broken at the switch when closed at said terminal.

5. In a warp stop-motion for looms the combination of a controlling-circuit for setting in operation the stopping mechanism, a harness-frame having a heddle-supporting bar included in said circuit, said circuit being closed through said bar by a fallen heddle when a warp-thread breaks or becomes unduly slack, a switch also included in said circuit, and pattern-forming mechanism for directly controlling said switch so as to close the circuit at said switch when the frame is at or near its lowermost position.

6. In a warp stop-motion for looms the combination of a controlling-circuit for setting in operation the stopping mechanism, a plurality of harness-frames, a switch included in said circuit and having contacts corresponding to the harness-frames, pattern-forming mechanism, and means actuated directly by said pattern-forming mechanism for closing the circuit of a given frame when said frame is at or near its lowermost position, and for breaking the circuit when the frame is at or near its uppermost position.

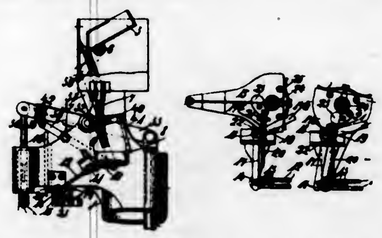
7. In a loom the combination with the pattern-forming mechanism, of mechanism for stopping the loom, a controlling-circuit for said stopping mechanism, a switch included in said circuit, said pattern-forming mechanism comprising a gear-wheel and means for imparting thereto a half-rotation to lower or raise the corresponding harness-frame, and means actuated by said gear to control the closing and opening of said switch.

8. In a loom the combination with the pattern-forming mechanism, of mechanism for stopping the loom, a controlling-circuit for said stopping mechanism, a switch included in said circuit, said pattern-forming mechanism comprising a gear-wheel and means for imparting thereto a half-rotation to lower or raise the corresponding harness-frame, a jack connected to said gear, said switch being so disposed as to be controlled by the movements of said jack so as to close and break the circuit at said switch when the corresponding harness-frame is at or near its lowermost and uppermost positions respectively.

9. In a warp stop-motion for looms the combination of a controlling-circuit for setting in operation the stopping mechanism, harness-frames each having a series of heddles suspended therein, a switch included in said circuit, jacks to which said frames are connected, means for actuating said jacks to lower and raise the frames in the formation of the shed, said switch being so disposed as to be controlled by said jacks to close and break the circuit at said switch when the corresponding frames are at their lowermost and uppermost positions respectively.

10. In a warp stop-motion for looms the combination of a controlling-circuit for setting in operation the stopping mechanism, a plurality of harness-frames, each frame having a series of heddles suspended therein, a switch included in said circuit and having contacts corresponding to the harness-frames, pattern-forming mechanism comprising gear-wheels and means for rotating the same, and means actuated by said gears to control the closing and opening of the corresponding switch-contacts.

813,310. NAIL-SUPPLYING DEVICE FOR SHOE-NAILING MACHINES. WILHELM KNECHT, Stuttgart, Germany. Filed June 30, 1905. Serial No. 267,576.



Claim.—1. In a nailing-machine, an inclined and grooved nail-guide, a pivotally-mounted recessed arm at the lower end of the guide, a stop-rod for engaging and holding the row of nails in the guide after the entrance of the lowermost nail into said recess, means for actuating the rod, and means for transmitting movement from the rod to the arm.

2. In a nailing-machine, an inclined and grooved nail-guide, a pivoted arm arranged to prevent the passage of the nails from the guide, said arm having a nail-receiving recess, a stop-rod arranged to enter to the rear of the lowermost nail, means for reciprocating the rod, and means for moving the arm to nail-discharging position.

3. In a nailing-machine, an inclined and grooved nail-guide, a pivoted arm arranged to prevent the passage of the nails from the guide, a slidable stop-rod movable across the guide, a cam for moving the rod in one direction, means for transmitting movement from the rod to the arm, and springs for returning the rod and arm to initial position.

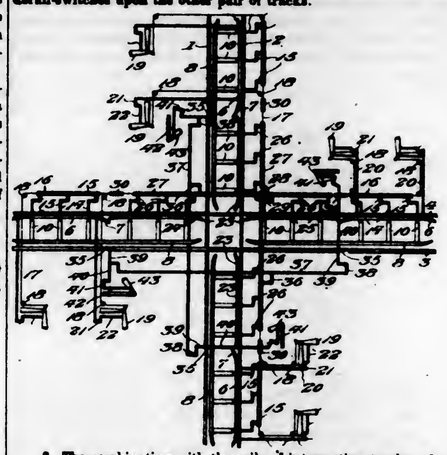
4. In a nailing-machine, a nail-guide, a movable carrier having a pair of spring-closed recessed arms arranged to receive successive nails from the guide, a nail-driver, nail-holding jaws below the driver, means for moving the carrier between the guide and jaws, and means for opening the arms of the carrier to deliver the nail to the jaws.

5. In a nailing-machine, a nail-guide, a movable carrier having a pair of spring-closed recessed arms arranged to receive successive nails from the guide, means supported by the carrier for effecting delivery of nails from the guide, a nail-driver, nail-holding jaws below the driver, means for moving the carrier between the guide and jaws and means for opening the arms of the carrier to deliver the nail to the jaws.

6. The combination with a nail-driver, of a pair of spring-closed jaws having recesses to receive a nail-head, a spring-elevated carrying-rod for said jaws, the jaws being movable with the driver during the first portion of the downward movement of the latter, and a stationary wedge-cam arranged between and adapted to open the jaws in advance of the completion of the driving operation.

813,311. RAILWAY-CROSSING. GEORGE W. LANCASTER, Petersburg, Va. Filed July 19, 1905. Serial No. 270,269.

Claim.—1. The combination with intersecting pairs of railway-tracks, of a pair of supplemental rails parallel with one of the tracks of each pair on opposite sides of the intersecting point, automatic means for holding said supplemental rails against the adjacent tracks, signals controlled by said supplemental rails, a pair of derail-switches upon each pair of tracks, and means operable subsequent to and independent of the rails on one pair of tracks for opening the derail-switches upon the other pair of tracks.



2. The combination with the rails of intersecting tracks, of a pair of supplemental rails in each track on each side of the point of crossing, automatic means for holding said rails in a prescribed position to be moved by the wheels of a car, signals controlled by one of the rails of each pair of supplemental rails, a derail-switch in each track on each side of the point of crossing, and means operated by the other rail of each pair of supplemental rails whereby the movement of the said supplemental rail on either side of the crossing in either track will open the derail-switches in the other track.

3. In a railway-crossing, the combination with the rails of intersecting tracks, of signal and switch operating rails in each track on each side of the point of crossing, derailing-switches in the tracks, the switches of one track being operatively connected with the switch-operating rails of the other track, signals alongside each track on opposite sides of the point of crossing, said signals being connected with said switch-operating rails, and means for preventing the operation of the other signals when any one signal is operated.

4. In a railway-crossing, the combination with the rails of intersecting tracks, of derail-switches in the tracks on opposite sides of the point of crossing, switch-arms associated with the tracks on opposite sides of the point of crossing, a switch and a signal operating rail in each track on each side of the crossing, automatic means for maintaining said rails in a prescribed position for operation by the wheels of a car, flexible connections between the series of signals for resisting the operation of said signals, expansible devices in said connections for permitting the operation of any one signal when the others have been operated, and connections between the switch-operating rails of one track and the derailing-switches of the other track.

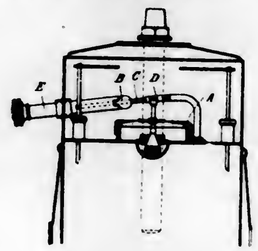
5. In a signaling and derailing system for railway-crossings, the combination with the rails of intersecting tracks, of signals for said tracks, train-operated means controlling said signals, and derailing means between said signal-controlling means and crossing, for derailing a train running past a danger-set signal.

6. The combination with intersecting pairs of railway-tracks, of a pair of supplemental rails parallel with one of the tracks of each pair on opposite sides of the intersecting point, automatic means for holding said supplemental rails against the adjacent tracks, signals controlled by said supplemental rails, a pair of derail-switches upon each pair of tracks, means operable subsequent to and independent of the rails on one pair of tracks for opening the derail-switches upon the other pair of tracks, and a signal associated with each derail-switch.

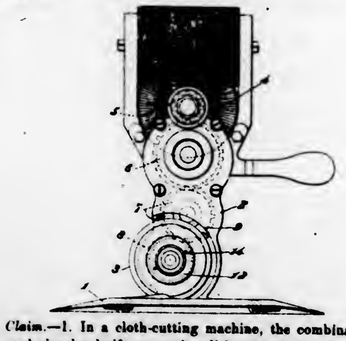
813,312. DRY METER FOR GAS, AIR, AND LIKE FLUIDS. DANIEL MACVEY, Edinburgh, Scotland. Filed Jan. 6, 1903. Serial No. 138,902.

Claim.—1. The combination with an ordinary consumer's meter for the purpose of measuring gas, of an adjustable pressure governor or regulator forming an integral part of the meter and a graduated index-key extending from outside the meter to the adjustable governor.

2. The combination with an ordinary consumer's meter for the purpose of measuring gas, of a valve in the meter-way tending to close by the gas-pressure, a lever acting on the valve to open it and an adjustable weight on the lever and a graduated index-key extending from outside the meter-case and adapted to adjust the weight on the lever.



813,313. CIRCULAR KNIFE AND RETAINING-GEAR THEREFOR FOR CLOTH-CUTTING MACHINES. HENRY A. MEYER, Cincinnati, Ohio, assignor to The Wolf Electrical Promoting Company, Cincinnati, Ohio, a Corporation of Ohio. Filed Dec. 4, 1905. Serial No. 290,230.

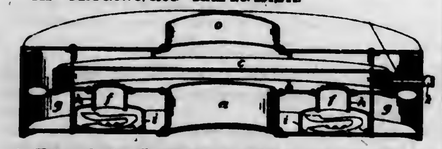


Claim.—1. In a cloth-cutting machine, the combination of a gear and circular knife or cutting-disk carried thereby, the gear-teeth having short or truncated base extensions at the outer side of the gear, and having a reduced threaded hub projecting from the same side, the knife having a central opening formed with notches fitting over said base extensions of the gear-teeth, and a collar screwed on said hub against the knife and clamping it against the gear.

2. In a cloth-cutting machine, the combination of the circular knife and retaining-gear therefor, the latter having its gear-teeth formed at one side with thin and short or truncated base extensions, the knife having a central opening formed with notches fitting over such base extensions, and means for clamping the knife in such position against the side of the gear.

3. A circular knife and retaining-gear for cloth-cutting machines, wherein the gear-teeth are formed with short or truncated thin base extensions, and the knife has a central opening formed with notches fitting over such extensions, and a collar screwed to the hub of the gear and clamping the knife against the side of the gear.

813,314. OIL-EXTRACTOR. HENRY B. MOFFAT, Woodstock, Canada. Filed Nov. 3, 1904. Serial No. 231,944.

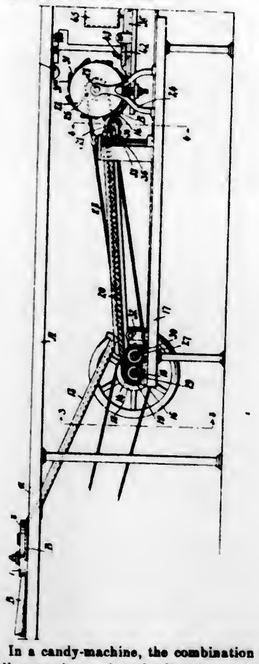


Claim.—1. An oil-extractor comprising a separating-chamber having inlet and outlet ports for the exhaust-steam, an expansion-chamber inclosing the separating-chamber and in circulation with the outlet-port of the separating-chamber and having an outlet-port for the exhaust-steam and a vacuum-breaking means for the expansion and separating chambers.

2. An oil-extractor for exhaust-steam comprising a separating-chamber having inlet and outlet ports for the exhaust-steam, an expansion-chamber inclosing the separating-chamber, oil-cups within the expansion-chamber opposed to the outlet-ports for the separating-chamber and means for breaking the vacuums in the separating and expansion chambers.

3. An oil-extractor for exhaust-steam comprising a separating-chamber having inlet and outlet ports for the exhaust-steam, an expansion-chamber inclosing the separating-chamber, oil-cups within the expansion-chamber opposed to the outlet-ports for the separating-chamber, means for breaking the vacuums in the separating and expansion chambers, and an automatically-operated controlling-valve for the vacuum-breaking means.

813,315. CANDY-MACHINE. ALBERT MOSEBACH, Philadelphia, Pa., assignor to himself, Henry Mosebach, Sr., and Henry Mosebach, Jr., copartners, trading as H. Mosebach & Sons, Philadelphia, Pa. Filed May 13, 1905. Serial No. 260,279.



Claim.—1. In a candy-machine, the combination with a feed-table, of an endless carrier, a chute leading from said table to the carrier, means for driving said carrier, a revoluble indenting-wheel adjacent the path of said carrier, means for actuating said wheel at the same rate of speed as the carrier, whereby the material upon the carrier is indented at intervals during its traverse, means for cooling the indented material, and means for breaking said material at the indented portions.

2. In a candy-machine, the combination of an endless carrier, a trough or guide therefor, an indenting-wheel beneath which said carrier passes, and by which wheel the material upon the carrier is indented, means for vertically adjusting said trough or guide, means for cooling the indented material, and means for breaking said material at the indented portions.

3. In a candy-machine, the combination of an endless carrier, a trough or guide therefor pivoted at one end, means for vertically adjusting said trough or guide, at its opposite end, an indenting-wheel beneath which the carrier passes and by which wheel the material upon the carrier is indented, means for cooling the indented material, and means for breaking said material at the indented portions.

4. In a candy-machine, the combination of an endless carrier, an indenting-wheel beneath which said carrier passes and by which wheel the material upon the carrier is indented, a guide-roller for said carrier adjacent the indenting-wheel, means for vertically adjusting said roller, means for cooling the indented material, and means for breaking said material at the indented portions.

5. In a candy-machine, the combination of an endless carrier, a trough or guide therefor, a roller on said trough or guide, an indenting-wheel beneath which said carrier passes, and by which wheel the material upon the carrier is indented, means for vertically adjusting said trough or guide and its said roller, means for cooling the indented material, and means for breaking said material at the indented portions.

6. In a candy-machine, the combination of a carrier for receiving and transporting the strip of material to be treated, and means adjacent the path of said strip adapted to be acted upon thereby to sound an alarm when such material buckles or clogs on the carrier.

7. In a candy-machine, the combination of a carrier for receiving and transporting the strip of material to be treated, mechanism for indenting the strip during its traverse, and means adjacent said mechanism for sounding an alarm should the material become buckled or clogged on the carrier.

8. In a candy-machine, the combination of an endless carrier by means of which a strip of plastic material, indented at intervals, is transported, an air-trunk extending above and along the same and having at intervals air-nipples directed toward the upper surface of said carrier and a strip-breaker to which the indented strip is progressively conveyed by the carrier.

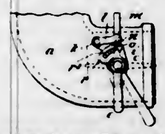
9. In a candy-machine, the combination of an endless carrier for receiving and transporting the strip to be treated, strip-indenting means adjacent said carrier, cooling means in the path of said carrier, and a strip-breaker adjacent to which the indented strip is conveyed by the carrier.

10. In a candy-machine, the combination of means for receiving and transporting a strip of material to be treated, means for progressively indenting said strip at intervals during its traverse, means for thereafter cooling the indented strip, and means for contacting with and breaking said strip into sections at the indented portions.

11. In a candy-machine, the combination of an endless carrier, an indenting-wheel under which said carrier passes, an air-trunk under which said carrier passes, and a vibratory strip-breaker to which said carrier leads.

12. In a candy-machine, the combination of an endless carrier for the strip of material to be treated, means for indenting said strip during its travel, an air-trunk for directing currents of air upon the traveling strip to cool the same, a member for contacting with and breaking the indented strips into lengths, and means for rapidly vibrating said member.

813,316. AUTOMATIC CUT-OFF FOR EXPLOSIVE-ENGINES. MAX MÜNZEL, Brunswick, Germany. Filed Jan. 6, 1905. Serial No. 239,918.



Claim.—1. An automatic cut-off for explosive-motors comprising the combination with a suction-pipe, of a valve mounted therein, means for shifting the valve to open position, means for retaining the valve in an open position, means for automatically returning the valve to closure position when released, and means for adjusting the valve after the same has been shifted to open position.

2. An automatic cut-off for explosive-motors, comprising a valve, means for shifting the valve to open position, means for retaining the valve in an open position during the operation of the motor, means for automatically returning the valve to closure position when released, and means for adjusting the valve after the same has been adjusted to open position.

3. An automatic cut-off for explosive-motors comprising the combination with a suction-pipe, of a valve mounted therein, means for opening the valve, means for retaining the valve in an open position during the operation of the motor, means operated by the governor of the motor for moving said retaining means to and from operative position during the operation of the motor, and for moving said retaining means to and holding it in inoperative position when the motor discontinues its operation, means for automatically returning the valve to closure position when said retaining means is moved to inoperative position, and means for adjusting the valve after the same has been moved to open position.

4. An automatic cut-off for explosive-engines comprising a valve, means for opening the valve, means for retaining the valve in an open position during the operation of the motor, means operated by the governor of the motor for moving said retaining means to and from operative position when the motor is started and for moving said retaining means to and holding it in inoperative position when the motor is stopped, and means for automatically returning the valve to closure position when released.

813,317. FLOOR-RACK FOR STALLS. JAMES H. MURRAY, Los Angeles, Cal. Filed Jan. 19, 1905. Serial No. 241,717.

Claim.—1. A floor-rack for stalls comprising two clamping means, each consisting of a lower member having upwardly-extending spacing means, and an upper member pivoted to the lower member and swinging to closed position on said spacing means, and longitudinal rack-bars extending across between the two clamping means and secured between the lower members and the spacing means and the upper members of said clamping means.

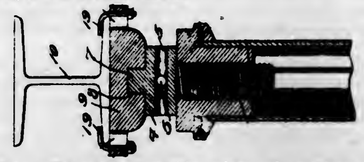
2. A floor-rack for stalls comprising two clamping means, each consisting of a lower member having upwardly-projecting spacing means countersunk at their upper ends, and an upper member pivoted to the lower member and swinging to closed position within the countersunk portion of said spacing means, and longitudinal floor-rack bars extending across between the two clamping means and secured between the said lower members, the upwardly-projecting spacing means thereon, and the upper members of the clamping means.

3. A floor-rack for stalls comprising two clamping means, each consisting of a lower member having upwardly-projecting spacing means countersunk at their upper ends, and an upper member pivoted to the lower member and swinging to closed position within the countersunk portion of said spacing means, and longitudinal floor-rack bars extending across between the two clamping means and secured between the said lower members, the upwardly-projecting spacing means thereon and the upper members of the clamping means, said bars being countersunk to receive said upper members.

4. A floor-rack for stalls comprising longitudinal members, and clamping means comprising upper and lower clamping-bars engaging the longitudinal members to hold them in fixed relation, one of said clamp-bars having projections and the longitudinal members being provided with sockets engaging said projections.

5. A floor-rack for stalls comprising longitudinal members, and clamp means therefor comprising upper and lower bars hinged together at one end and adapted to engage above and below the longitudinal members, one of said bars being provided at the other end with a hinged retaining device engaging with the other bar.

813,318. COLUMN. THOMAS F. MCCARTHY, Waltham, Mass. Filed May 3, 1904. Serial No. 206,229.



Claim.—The combination with a column, of a cap-piece seated on the upper end of the column and provided with a vertical screw-threaded passage, a jack-screw consisting of a body having upper and lower parallel faces, a depending screw-threaded stem to engage in the passage of the cap-piece, and vertical stud on its upper face, and having passages to receive a turning-lever, and a capital-piece having a socket to fit over the vertical stud on the body of the jack-screw, and vertically-slotted side ears, and bolts having turned-down upper end portions in the slotted side ears to engage the flanges of a girder.

813,319. TOOL FOR MARKING AND INCISING HUB OF BUTT. [illegible]

means for securing said gage devices to the flanged head; and means

818,319. TOOL FOR MARKING AND INCISING HINGE-BUTT RECESSES. WILLIAM J. McINTYRE, Hartford, Conn. Filed May 17, 1905. Serial No. 260,760.

Claim.—1. A tool for marking and incising the lines of hinge-leaf recesses, comprising united sides each having a cutting edge, a cross-plate connecting the sides, and also having a cutting edge; plates; gages carried by said plates; and means for securing said plates to either the inner or outer surfaces of the sides of the tool.

2. The combination, with a tool having three cutting edges, one at right angles to, and connecting, the others, of gage devices carried by the tool, and serving to locate the position thereof upon the work; and means for securing said gage devices either to the inner or outer surfaces of the side plates.

3. The combination, with a tool having sides provided with cutting edges at their lower ends, and with a sharpened plate uniting said sides, of gage devices; and means for adjustably securing said gage devices either to the inner or the outer surfaces of said sides.

4. The combination, with a tool having sides sharpened at their lower ends, and a sharpened cross-plate uniting said sides, of plates adjustably mounted on the sides; gages carried by said plates; and means for securing said plates either to the outer or inner surfaces of said sides.

5. The combination, with a box-like tool for incising material, of gage devices; and means for securing said gage devices either to the inner or outer sides of said tool.

6. The combination, with an incising-tool, of slotted plates secured to the sides of said tool, each plate having a flanged head; and gage-plates secured to the flanges of the heads.

7. The combination, with an incising-tool having three cutting edges, of plates adjustably secured to the sides of said tool; reversible gage-plates carried by said adjustable plates; screws for securing said gage-plates; and removable spacers adapted to be inserted between said gage-plates and the adjustable plates, said spacers being notched to fit over the screws.

8. The combination, with an incising-tool, of longitudinally-slotted plates secured to the sides of said tool, each plate having a flanged head; gage-plates secured to the flanges of the heads; screws for securing the gage-plates to the heads; and spacers notched to fit over the screws.

9. The combination, with a tool, and with plates secured to the sides thereof, of gage-plates; screws for securing said gage-plates to the other plates; and interchangeable spacers of different thicknesses notched to fit over said screws, and adapted to be interposed either between the heads of the screws and the gage-plates, or between the gage-plates and the other plates.

10. A universal tool for marking and incising hinge-butt recesses comprising sides having cutting edges, a third cutting edge at right angles to said sides; gage devices; and means for securing said gage devices either to the outer or the inner surfaces of said sides.

11. The combination, with an incising-tool having rows of perforations, of plates; gage devices carried by the plates, and each having a row of perforations; and securing devices adapted to enter any of the perforations of the gage devices, and to secure said devices to said plates.

12. The combination, with an incising-tool having a series of rows of screw-holes, of plates; screws for securing the plates, and adapted to be inserted in the perforations of either row; perforated gage devices; and means for securing said gage devices to the plates.

13. The combination, with an incising-tool, of plates shaped to be secured on either the inner or outer sides thereof; gages carried by the plates; and screws having ends shaped to receive different tools for securing said plates in position.

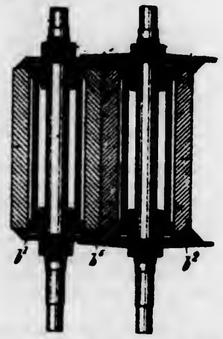
14. The combination, with an incising-tool with space-embracing sides, of gage-carrying plates adapted to be secured either to the inner or outer surfaces of the sides of said tool; and screws, having notched heads and angular ends, for securing said plates in position.

15. The combination, with an incising-tool, having separated sides, of a plate having a flanged head extended further on one side than on the other; a reversible gage device carried by the plate; means for securing said gage device to the flanged head; and means for securing said plate to either side of the tool.

16. The combination, with an incising-tool having separated sides, of plates, each having a head extending farther on one side than on the other; a gage-plate secured to each head; and means for securing each plate having a head either on one side or on the other side of said tool.

17. In an incising-tool, the combination, with a plate having a flanged head, and with means for adjustably securing said plate to said tool, of gage-plates; screws passing through perforations in the gage-plates, and threaded into the flange of the head; and interchangeable spacers of different thicknesses, and notched to receive the screws and each having a curved bottom wall, for the purpose set forth.

818,320. LATERAL PACKING FOR THE END FACES OF PAIRS OF ROLLERS. FERDINAND B. F. HUSMANN, Wandsbek, Germany, assignor to The Firm of Kalmo-Compagnie Theodor Reinhardt Gesellschaft mit Beschränkter Haftung, Wandsbek, Germany. Filed June 9, 1904. Serial No. 211,766.



Claim.—1. The combination with a pair of rolls, of cup-shaped packing-heads rotatable with the rolls, those for one roll adapted to cover the ends of the line of contact between the rolls and to have bearing on the packing-heads for the other roll.

2. The combination with a pair of rolls, of rotatable packing-heads for one roll having the form of a hollow frustum of a cone, and rotatable packing-heads for the other roll having a circular rib adapted to cover the ends of the line of contact between the rolls and have bearing on the peripheral inclined faces of the heads for the first-named roll.

3. The combination with a pair of rolls, of packing-heads for one roll having the form of a frustum of a hollow cone, and packing-heads for the other roll provided with a circular rib and an encompassing flange, said ribs adapted to cover the ends of the line of contact between the rolls and to have bearing on the peripheral inclined faces of the heads for the first-named roll, and said flanges adapted to overlap the last-named heads.

4. The combination with a pair of rolls having their peripheral end edges beveled, of packing-heads for one roll having the form of a frustum of a hollow cone, and packing-heads for the other roll provided with a circular rib triangular in cross-section projecting into the recess formed by the beveled edges of the rolls at the opposite ends of the line of contact and with a shoulder having bearing on the end faces of the roll, said ribs having bearing also on the conical heads of the first-named roll.

5. The combination with a pair of rolls having their peripheral end edges beveled; of packing-heads for one roll having the form of a truncated hollow cone, and discoidal packing-heads for the other roll overlapping the heads for the first-named roll and provided with a circular rib triangular in cross-section bearing on the aforesaid conical heads and projecting into the recesses formed at the ends of the line of contact between the rolls by their beveled edges, said ribs also provided with a circular shoulder bearing on the end faces of their roll.

6. The combination with a pair of rolls, of cup-shaped packing-heads, those for one roll adapted to cover the ends of the line of contact between the rolls and to have bearing on the packing-heads for the other roll, and means to compensate for the wear of the contacting surfaces.

7. The combination with a pair of rolls, of packing-heads for one roll having the form of a hollow frustum of a cone, and packing-heads for the other roll having a circular rib adapted to cover the ends of the line of contact between the rolls and have bearing on the peripheral inclined faces of the heads for the first-named roll and means to compensate for the wear of the contacting surfaces.

8. The combination with a pair of rolls, of packing-heads for one roll having the form of a frustum of a hollow cone, and packing-heads for the other roll provided with a circular rib and an encompassing flange, said ribs adapted to cover the ends of the line of contact between the rolls and to have bearing on the peripheral inclined faces of the heads for the first-named roll, said flanges adapted to overlap the last-named heads and means to compensate for the wear of the contacting surfaces.

9. The combination with a pair of rolls having their peripheral end edges beveled; of packing-heads for one roll having the form of a frustum of a hollow cone, and packing-heads for the other roll provided with a circular rib triangular in cross-section projecting into the recess formed by the beveled edges of the rolls at the opposite ends of the line of contact and with a shoulder having bearing on the end faces of the roll, said ribs having bearing also on the conical heads of the first-named roll, and means to compensate for the wear of the contacting surfaces.

10. The combination with a pair of rolls having their peripheral end edges beveled; of packing-heads for one roll having the form of a truncated hollow cone, and discoidal packing-heads for the other roll overlapping the heads of the first-named roll and provided with a circular rib triangular in cross-section bearing on the aforesaid conical heads and projecting into the recesses formed at the ends of the line of contact between the rolls by their beveled edges, said ribs also provided with a circular shoulder bearing on the end faces of their roll, and means to compensate for the wear of the contacting surfaces.

11. The combination with a pair of rolls and their shafts; of cup-shaped packing-heads for each roll mounted on their respective shafts, the packing-heads for one roll adapted to cover the ends of the line of contact between the rolls and to have bearing on the packing-heads for the other roll and means to adjust the said packing-heads relatively to their rolls.

12. The combination with a pair of rolls and their shafts; of packing-heads for one roll having the form of a frustum of a hollow cone mounted on the roll-shaft, and packing-heads for the other roll likewise mounted on its shaft and having a circular rib adapted to cover the ends of the line of contact between the rolls and to have bearing on the conical heads for the first-named roll, and means to adjust the said heads relatively to the rolls.

13. The combination with a pair of rolls and their shafts; of packing-heads for one roll mounted on its shaft and having the form of a frustum of a hollow cone, and packing-heads for the other roll likewise mounted on the shaft thereof and provided with a circular rib and an encompassing flange, said rib adapted to cover the ends of the line of contact between the rolls and to have bearing on the conical heads of the first-named roll and said flanges adapted to overlap the last-named heads and means to adjust the packing-heads relatively to their rolls.

818,321. TRANSFER-TICKET. WILLIAM C. POPE, Philadelphia, Pa. Filed July 6, 1905. Serial No. 268,237.

Claim.—1. A transfer-ticket comprising a body portion having means to constitute a circular row of hour indications, said body portion further provided with means to constitute a single fraction of an hour indication, said single fraction of the hour indication surrounded at a point removed therefrom by said row of hour indications and associating with any one of said hour indications to constitute a complete hour time limit when any one of said hour indications is mutilated.

2. A transfer-ticket comprising a body portion having means to constitute a circular row of hour indications, said body portion further provided with means to constitute a single fraction of an hour indication, said single fraction of the hour indication surrounded at a point removed therefrom by said row of hour indications and associating with any one of said hour indications to constitute a complete hour time limit when any one of said hour indications is mutilated, and said body portion further provided with means to designate said row of hour indications postmeridian or antemeridian.

3. A transfer-ticket comprising a body portion having means to constitute a circular row of hour indications, said body portion further provided with means to constitute a single fraction of an hour indication, said single fraction of the hour indication surrounded at a point removed therefrom by said row of hour indications and associating with any one of said hour indications to constitute a complete hour time limit when any one of said hour indications is mutilated, and said body portion further provided with means to constitute a row of even-hour indications constituting in itself a complete time limit and independent of said fraction of the hour-indicating time limit.

4. A transfer-ticket comprising a body portion having means to constitute a circular row of hour indications, said body portion further provided with means to constitute a single fraction of an hour indication, said single fraction of the hour indication surrounded at a point removed therefrom by said row of hour indications and associating with any one of said hour indications to constitute a complete hour time limit when any one of said hour indications is mutilated, said body portion further provided with means to constitute a row of even-hour indications constituting in itself a complete time limit and independent of said fraction of the hour-indicating time limit, and said body portion further provided with means to designate said rows of hour indications postmeridian or antemeridian.

5. A transfer-ticket comprising a body portion having means to constitute a plurality of circular rows of hour indications, said body portion further provided with means to constitute a plurality of fractions of the hour indications, each of said fractions of the hour indications surrounded at a point removed therefrom by a row of hour indications and associating with any one of the hour indications of its respective row to constitute a complete hour time limit when any one of said hour indications of said row is mutilated.

6. A transfer-ticket comprising a body portion having means to constitute a plurality of circular rows of hour indications, said body portion further provided with means to constitute a plurality of fractions of the hour indications, each of said fractions of the hour indications surrounded at a point removed therefrom by a row of hour indications and associating with any one of the hour indications of its respective row to constitute a complete hour time limit when any one of said hour indications of said row is mutilated, and said body portion further provided with means to constitute said rows of hour indications postmeridian and antemeridian.

7. A transfer-ticket comprising a body portion having means to constitute a plurality of circular rows of hour indications, said body portion further provided with means to constitute a plurality of fractions of the hour indications, each of said fractions of the hour indications surrounded at a point removed therefrom by a row of hour indications and associating with any one of the hour indications of its respective row to constitute a complete hour time limit when any one of said hour indications of said row is mutilated, and said body portion further provided with means to constitute a row of even-hour indications constituting in itself a complete time limit and independent of any one of said fractions of the hour-indicating time limit.

8. A transfer-ticket comprising a body portion having means to constitute a plurality of circular rows of hour indications, said body portion further provided with means to constitute a plurality of fractions of the hour indications, each of said fractions of the hour indications surrounded at a point removed therefrom by a row of hour indications and associating with any one of the hour indications of its respective row to constitute a complete hour time limit when any one of said hour indications of said row is mutilated, said body portion further provided with means to constitute a row of even-hour indications constituting in itself a complete time limit and independent of any one of said fractions of the hour-indicating time limit, and said body portion further provided with means to designate said rows of hour indications antemeridian and postmeridian.

9. A transfer-ticket comprising a body portion having means to constitute a plurality of pairs of circular rows of hour indications, said body portion further provided with means to constitute a plurality of fractions of the hour indications, each of said fractions of the hour indications surrounded at a point removed therefrom by the inner row of a pair of rows of hour indications and associating with any one of the hour indications of either row of its respective pair of rows to constitute a complete hour time limit when any one of said hour indications of the respective pair of rows is mutilated.

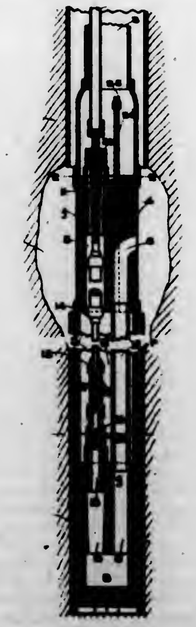
10. A transfer-ticket comprising a body portion having means

to constitute a plurality of pairs of circular rows of hour indications, said body portion further provided with means to constitute a plurality of fractions of the hour indications, each of said fractions of the hour indications surrounded at a point removed therefrom by the inner row of a pair of rows of hour indications and associating with any one of the hour indications of either row of its respective pair of rows to constitute a complete hour time limit when any one of said hour indications of its respective pair of rows is mutilated, and said body portion provided with means to designate one row of each pair of rows of hour indications antemeridian and the other row of each pair of rows postmeridian.

11. A transfer-ticket comprising a body portion having means to constitute a plurality of pairs of circular rows of hour indications, said body portion further provided with means to constitute a plurality of fractions of the hour indications, each of said fractions of the hour indications surrounded at a point removed therefrom by the inner row of a pair of rows of hour indications and associating with any one of the hour indications of either row of its respective pair of rows to constitute a complete hour time limit when any one of said hour indications of its respective pair of rows is mutilated, and said body portion further provided with a row of even-hour indications constituting in itself a complete time limit and independent of said fractions of the hour-indicating time limits.

12. A transfer-ticket comprising a body portion having means to constitute a plurality of pairs of circular rows of hour indications, said body portion further provided with means to constitute a plurality of fractions of the hour indications, each of said fractions of the hour indications surrounded at a point removed therefrom by the inner row of a pair of rows of hour indications and associating with any one of the hour indications of either row of its respective pair of rows to constitute a complete hour time limit when any one of said hour indications of its respective pair of rows is mutilated, said body portion further provided with a row of even-hour indications constituting in itself a complete time limit and independent of said fractions of the hour-indicating time limit, and said body portion further provided with means to designate said rows of hour indications postmeridian and antemeridian.

813,822. DEVICE FOR RAISING LIQUIDS FROM WELLS. WILLIAM RICHARDS, Mayburg, Pa. Filed Feb. 3, 1904. Serial No. 191,841.



Claim.—1 In an improved device for raising liquids from wells, a reservoir located below the producing strata, a bridge located at the upper end of said reservoir, a valve located in said bridge, there being an air-passage and an oil-passage formed within the body of said valve.

2. In an improved device for raising liquids from wells, the combination of two valves connected together and adapted to seat one below the other, means in said connection adapted to automatically adjust said valves to irregularities of distance between their respective seats.

3. In an improved device for raising liquids from wells, the shot-hole in said well, in combination with a bridge located in said shot-hole, there being a fluid-inlet in said bridge, the reservoir attached to and extending below said bridge, the packing about said reservoir, substantially as and for the purpose specified.

4. In an improved device for raising liquids from wells, a bridge located in the shot-hole of the well, there being a valveless or non-closing fluid-inlet in said bridge, in combination with a fluid-receiving reservoir extending below said bridge, means of preventing the regurgitation of said fluid and means of forcing the fluid from said reservoir to the surface of the earth.

5. In an improved device for raising liquids from wells, a tubing located in the well, a bridge located in said tubing, a return-chamber located below said bridge and connected thereto by a reservoir, valve-seats in said bridge and said return-chamber, valves attached to an air-pipe and adapted to seat in said seats respectively, a slip-joint located in said pipe, adapted to secure the proper seating of said valves.

6. In an improved device for raising liquids from wells, tubing extending below the producing stratum, a bridge interposed in said tubing and located at the producing stratum, the tubing below said bridge being adapted as a receiving-reservoir, a fluid-inlet in said bridge, means of conducting the fluid entering by said inlet to said receiving-reservoir, means of preventing the regurgitation of said fluid, and means of forcing said fluid from the receiving-reservoir to the surface of the earth.

7. In an improved device for raising liquids from wells, a reservoir, a bridge located above said reservoir, a vent in said bridge adapted to the free escape of air and gas therefrom, a pipe secured in the bridge at said vent, and extending upward from said bridge, a valve attached to the upper end of said pipe, adapted to permit a normal flow of gas or air therefrom, and to be closed by an abnormal flow of gas or air, and to automatically open when said pressure or flow again becomes normal.

8. In an improved device for raising liquids from wells, a reservoir, a bridge located at the top of said reservoir, there being a longitudinal hole through said bridge and an oil-inlet in said bridge, communicating with the shot-hole, a return-chamber located at the bottom of said shot-hole and having an oil-duct therein adapted to admit oil to said reservoir, a valve seated in the duct of said return-chamber, a valve seated in the longitudinal hole of said bridge, a pipe communication between the oil-inlet in the bridge and in the return-chamber.

9. In an improved device for raising liquids from wells, tubing or pipe located in said well, a bridge in said tubing located in the shot-hole, a reservoir attached to said bridge and extending below the same, a return-chamber located in the bottom of said reservoir, means of admitting liquid to said reservoir by way of said bridge and return-chamber, an air-pipe located in said tubing, valves attached to said pipe and adapted to seat in said bridge and said return-chamber respectively, said valves being adapted to allow the liquid to pass upward therethrough and to prevent the return of same, means of admitting compressed air to said reservoir, and means of conducting oil to the surface of the ground, or to another storage-chamber above the bridge.

10. In an improved device for raising oil from wells, the combination of tubing extending from the surface down to the shot-hole or oil-producing stratum, a bridge affixed to said tubing and located in said shot-hole, there being a longitudinal hole extending through said bridge, and the upper end thereof adapted as a valve-seat, and a longitudinal hole extending from the lower end of said bridge partly through the same and having a lateral opening into the shot-hole, and adapted as an inlet for oil, tubing attached to the bottom of said bridge and extending downward therefrom below the oil-producing strata and adapted as a storage-reservoir, a return-chamber located at the bottom of said reservoir, means of conducting oil from the shot-hole into said chamber, means permitting said oil to pass into the storage-reservoir, an air-pipe extending from the surface of the ground down into the tubing, valves thereon adapted to seat in the bridge and in the return-chamber respectively and adapted to permit oil to pass upwardly through the same and to prevent the return thereof.

813,823. FUMIGATING MATERIAL AND PROCESS OF MAKING SAME. JULIAN H. RIVERS, St. Louis, Mo., assignor to Hydro-Press Manufacturing Company, St. Louis, Mo., a Corporation of Missouri. Filed Apr. 21, 1905. Serial No. 256,265.

Claim.—1. As an article of manufacture a hollow block composed of tobacco, fibrous pulp, and nitrate of potash.

2. As an article of manufacture, a hollow block composed of tobacco, fibrous pulp, and nitrate of potash, and a bonding-cover, substantially as specified.

3. The process of making fumigating material composed of tobacco, fibrous pulp and nitrate of potash, which consists in mixing the required proportions of the said substance together in water, shaping the mixture into slabs and binding the slabs together.

4. A combustible fumigating-block, comprising a plurality of slabs having beveled edges and of which the component elements are tobacco, fibrous pulp, and nitrate of potash, and a bonding-cover adapted to hold the beveled edges of the slabs together, as required to form a hollow rectangular block.

5. A combustible fumigating-block consisting of tobacco, fibrous pulp, and nitrate of potash mixed together to form slabs, and a bonding-cover to hold a plurality of slabs together.

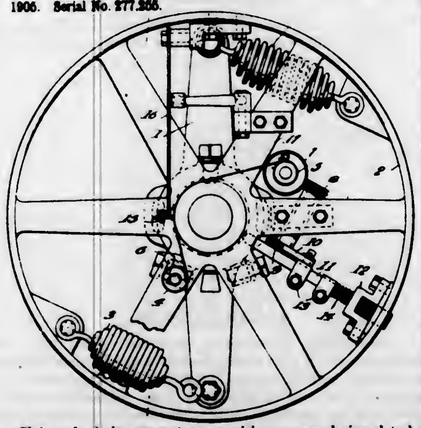
6. A combustible fumigating-block consisting of tobacco, fibrous pulp, and nitrate of potash mixed together and shaped into elongated hollow form, and a bonding-cover inclosing the sides of the hollow block.

7. A hollow combustible object, comprising tobacco-dust, fibrous material, an oxygen-bearing element, and sulfur mixed together and solidified to form an elongated hollow block, and a bonding-cover inclosing the block.

8. As an article of manufacture, a hollow block composed of tobacco, fibrous material, an oxygen-bearing element, and a bonding-cover inclosing the block, substantially as specified.

9. A combustible fumigating-block composed of tobacco, fibrous material, and an oxygen-bearing element mixed together and compressed into slabs, a plurality of said slabs being arranged into open-ended box form, and a bonding-cover holding said slabs in box form, substantially as described.

813,824. DYNAMOMETER. WALTER H. RUDDICK, New York, N. Y., administrator of Hamilton Ruddick, deceased. Filed Sept. 6, 1905. Serial No. 277,255.



Claim.—1. A dynamometer comprising an arm designed to be secured to a shaft or the like, a pulley yieldingly connected to said arm, a stylus-holder and stylus mounted to oscillate within the pulley, a bell-crank lever carried by the pulley, links having a universal-joint connection with the arms of said lever and with said first-named arm and stylus-holder respectively, whereby the variation in the position of the first-named arm and the pulley will effect a movement of the stylus-holder, and means for feeding a record-sheet across the stylus in a direction at right angles to the line of movement of the stylus-holder.

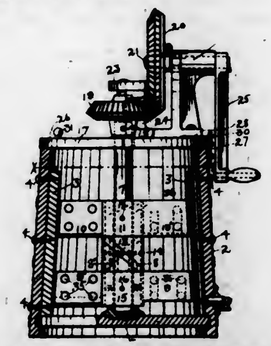
2. A dynamometer comprising an arm designed to be secured to a shaft or the like, a pulley designed to assume different positions with relation to said arm, an oscillating stylus-holder mounted within the pulley, a bell-crank lever carried by the pulley, links connected to the arms of said lever, the first-named arm and stylus-holder respectively, whereby a change in the relative position of the pulley and the first-named arm will rock said lever and effect an oscillation of the stylus-holder, and means for intermittently feeding a record-sheet across the stylus in a direction at right angles to the line of oscillation.

3. A dynamometer comprising an arm designed to be secured to a shaft or the like, a pulley yieldingly connected to said arm, a stylus-holding bar pivotally suspended within the pulley, a bell-crank lever fulcrumed to a spoke of the pulley and provided with two angularly-projecting arms, links pivotally connecting the arms of said lever with the first-named arm and stylus-holding bar respectively, and means for feeding a record-sheet across the path of said stylus-holding bar in a direction at right angles to the line of oscillation thereof.

4. A dynamometer comprising an arm designed to be secured to a shaft or the like, a pulley encircling said arm, contractile springs yieldingly connecting the ends of said arm with the pulley at diametrically opposite points of the latter, a pivotally-suspended stylus-holding bar mounted in the pulley, a bell-crank lever fulcrumed on the pulley and having a link connection with the first-named arm and bar respectively, spools carried by the pulley at opposite sides of the hub thereof, a paper strip designed to extend from one spool to the other and bear upon the face of said hub, and means for intermittently feeding said paper over said hub, for the purpose set forth.

5. A dynamometer comprising an arm designed to be secured to a shaft or the like, a pulley yieldingly connected to said arm and designed to assume different advanced positions with relation thereto, an oscillating stylus-holding bar mounted on said pulley, a bell-crank carried by said pulley, links connecting said bell-crank with the first-named arm and stylus-holding bar respectively, spools carried by said pulley and designed to receive a record-strip, one of said spools being provided with a gear, a worm-shaft mounted in a bearing on the pulley and provided at one end with a worm meshing with said gear and at its opposite end with a ratchet, and a longitudinally-movable rod 11 mounted in bearings on the pulley with its end protruding through the rim thereof, said rod carrying a pawl 10 meshing with said ratchet, as and for the purpose set forth.

813,825. BUTTER-CHURN. CLAY M. RUNYAN, Elyria, Ohio. Filed Aug. 10, 1905. Serial No. 273,004.



Claim.—In a churn, a dasher consisting of a rotary shaft, a series of pairs of paddles having integral hubs mounted on said shaft, each of said paddles having a face, or faces, arranged in a plane which intersects all of the planes in which the faces of the other paddles are arranged, said paddles and hubs having air passages or perforations therein, the air-passages through said hubs forming air-tubes which communicate with the air above and below said dasher.

813,826. PROTECTING-RAIL FOR BUILDING STRUCTURES, STAIRS, CORNERS, AND THE LIKE. MAX REPER, Ohligs, Germany. Filed Apr. 12, 1905. Serial No. 255,922.

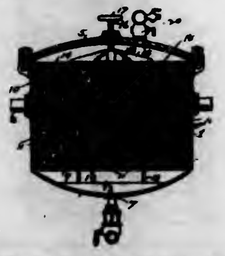
Claim.—1. In an article for the purposes described, the combination of a strip having formed in one face a longitudinally-extending groove, the side walls of which are bent inwardly at a plurality of opposite points intermediate of the ends of the groove to vary the form and dimensions of the groove at said points, and a fastening member having at one end a laterally-projecting section adapted to freely enter and move in the body of the groove and to fit closely in either of the contracted portions of said groove, substantially as set forth.

2. In an article for the purposes described, the combination of a strip provided in one face with a longitudinally-extending groove having alternately-arranged sections of different cross-sectional form, and a fastening member having one end adapted to freely enter and move in alternate sections of said groove and to fit closely in the intermediate sections of the groove, substantially as set forth.

3. In an article for the purposes described, the combination of a strip having a groove extending throughout the length of one face, the side walls of said groove being bent inwardly at a plurality of opposite points to vary the form and dimensions of the groove at said points, and fastening members each adapted to fit closely within the contracted portions of said groove and to move freely in the other sections thereof, substantially as set forth.

4. In an article for the purposes described, the combination of a strip having a groove extending throughout the length of one face, the side walls of which are bent inwardly at an intermediate point in the length of said walls, and a fastening member having at one end a laterally-projecting section adapted to freely enter and move in the body of the groove and to fit closely in the contracted portion formed by the inward bending of the side walls of said groove, substantially as set forth.

813,327. FILTER. Baldwin F. Schreiber, Cleveland, Ohio. Filed Mar. 21, 1904. Serial No. 199,179.



Claim.—1. A filter, comprising, in combination, a main filter-chamber, vertical partitions therein provided with longitudinal and lateral openings, a perforated plate forming the top of the chamber, a perforated plate forming the bottom of the chamber, with which top and bottom plates the partitions alternately engage, a primary filtering-chamber mounted upon the main chamber, and communicating therewith through said top perforated plate, a common casing for both chambers, an inlet-passage leading to the primary chamber, an outlet-passage leading from the main chamber and a filter in each chamber, substantially as described.

2. A filter comprising, an external casing, and upper primary and lower secondary filter-chambers therein, perforated plates forming end plates for said chambers, a perforated plate separating said chambers, a pressure device for the primary chamber, vertical partitions in said secondary chamber alternately engaging the perforated plates which inclose said chamber and provided with vertical and lateral passages, a central perforated tube, engaging the upper perforated plate of the lower chamber, loosely-packed filter mass in the primary chamber, and tightly-packed filter mass in the secondary chamber, separating the partitions from each other and from the perforated plates at alternate ends, substantially as described.

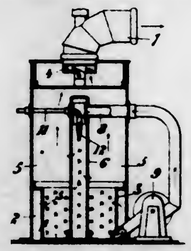
3. The combination in a filter, of a casing, a cover therefor, a bottom sloping to an outlet-passage, a perforated plate in said bottom, a tightly-packed filter mass upon said perforated bottom plate, a perforated top plate upon the filter mass, vertical partitions concentrically arranged in said filter mass and alternately engaging said top and bottom plates, the said partitions being laterally perforated, a filter mass upon the said top plate, a perforated plate thereon, and a pressure device for said last-mentioned perforated plate consisting of a pressure-plate resting thereon and a screw passing through the said cover for the casing, substantially as described.

4. The combination with a casing, and perforated top and bottom plates of a filter, of a filter mass tightly compressed between said plates, and vertical concentric partitions, in said mass, provided with vertical and lateral passages, the said partitions alternately engaging the said perforated plates, and alternately separated therefrom, substantially as described.

5. In a filter, the combination with a casing, of a filter-mass chamber therein, perforated plates forming the top and bottom thereof, and partitions therein comprising concentrically-arranged vertical plates, each partition comprising oppositely-corrugated plates in close juxtaposition, the opposing corrugations of said plates alternately touching and alternately forming vertical passages, lateral openings in both of said corrugated plates, and the said partitions so disposed alternately engaging the top and bottom plates, and alternately out of contact therewith, and a filter mass, separating said partitions from one another, and alternately separating said partitions from the top and bottom plates, substantially as described.

6. A filter, comprising in combination, a main filter-chamber, vertical partitions therein, provided with vertical and lateral openings, a perforated plate forming one end of the chamber, a perforated plate forming the other end of the chamber, with which plates the partitions alternately engage, a primary filtering-chamber mounted upon the main chamber and communicating therewith through the separating perforated plate at that end, a common casing for both chambers, an inlet-passage leading to the primary filter-chamber, an outlet-passage leading from the main chamber, filter mass filling each chamber, and a pressure device for the primary filter-chamber, substantially as described.

813,328. APPARATUS FOR MOISTENING AND WARMING ROOMS OR APARTMENTS. August Schmidt, Langenaslau, Germany. Filed May 19, 1905. Serial No. 261,273.



Claim.—1. An air-moistening apparatus, comprising a receptacle provided with a moistening-chamber and an air-inlet chamber, a perforated partition between the said chambers and adapted to divide the air fed from the air-chamber to the moistening-chamber in the form of jets, a perforated water-distributing pipe arranged in the moistening-chamber and adapted to cause the supplying of water to said moistening-chamber in the form of jets to intercept the jets of air thereby moistening the latter, means communicating with the moistening-chamber and with said pipe for withdrawing the surplus water from said chamber and returning the same to said pipe, and a nozzle extending in said pipe and adapted to supply steam thereto under pressure, and a suction-fan arranged in the upper end of said receptacle and in suitable relation with respect to a conducting-conduit.

2. An air-moistening apparatus, comprising a receptacle provided with a moistening-chamber, means for supplying air to said chamber in the form of jets, a perforated water-distributing pipe arranged in the moistening-chamber, adapted to cause the supply of water to said moistening-chamber in the form of jets to intercept the jets of air, thereby moistening the latter, means communicating with the moistening-chamber and with said pipe for withdrawing the surplus water from said chamber and returning the same to said pipe, and a nozzle extending in said pipe and adapted to supply steam thereto under pressure.

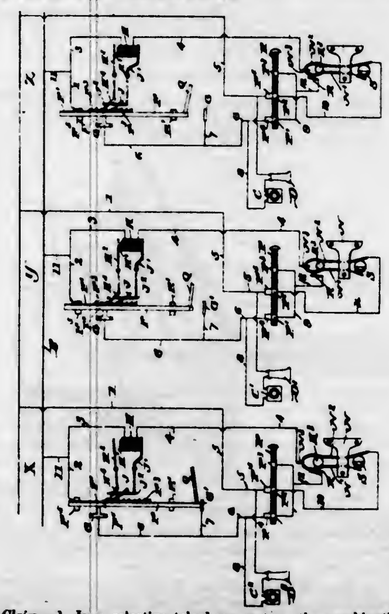
813,329. REIN-GUARD. William A. Scott and William S. McCall, Quincy, Fla. Filed Aug. 29, 1905. Serial No. 276,273.

Claim.—1. The combination with a doubletree having spaced swingletrees pivoted thereto, of a rod provided with terminal eyes for engagement with the pivot-bolts of said swingletrees and having its central portion bent upwardly to form an open loop, whereby the rod may be adjusted longitudinally to correspond to varying lengths of doubletrees.

2. The combination with a doubletree having spaced swingletrees pivoted thereto, of a rod provided with terminal eyes for engagement with the pivot-bolts of said swingletrees and having its opposite ends at said eyes bent upwardly to space the intermediate portion of the rod from the swingletrees, said rod being provided with a centrally-disposed open loop whereby the rod may be adjusted longitudinally to correspond to varying lengths of doubletrees.

3. A rein-guard formed of a piece of flexible material having its opposite ends provided with terminal eyes and its intermediate portion bent upwardly at said eyes and provided with a centrally-disposed open loop.

813,330. TELEPHONE SYSTEM. Ralph Sherer, Eaton, Ohio. Filed Oct. 17, 1904. Serial No. 228,785.



Claim.—1. In a selective telephone system, the combination with a generator-gear shaft, a movable bar having a contact-plate, means for moving the bar step by step, and means connected to the bar adapted to lock the said shaft when the bar has moved one step.

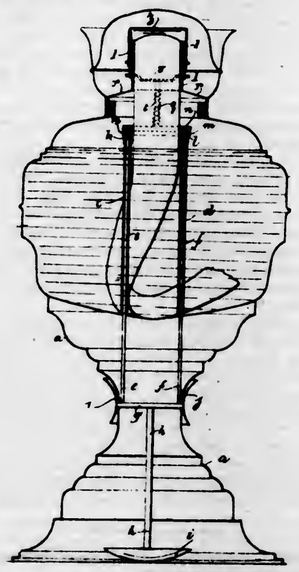
2. A selective telephone system comprising talking and ringing circuits, a plurality of movable bars having contact-plates arranged in the talking-circuit, a plurality of electromagnets arranged in the ringing-circuit, pawls actuated by said magnets adapted to lift the bars step by step, and means for cutting out the electromagnet at the calling-station.

3. A selective telephone system comprising talking and ringing circuits, a plurality of movable, toothed bars having contact-plates arranged in the talking-circuits, electromagnets arranged in the ringing-circuits, a call-bell generator, pawls adapted to engage the bar-teeth and actuated by the magnets, means for automatically cutting out the magnet at the calling-station, and means for locking the call-bell-generator shafts upon movement of the bars.

4. In a selective telephone system, a movable toothed bar, a contact upon which the bar normally rests, a contact-plate carried by the bar, a contact-plate arranged adjacent the bar adapted to be engaged by the contact-plate on the bar, the said bar forming a portion of the talking-circuit, an electromagnet in the calling-circuit, pivoted armature-levers, pawls actuated by said levers and adapted to lift the bar step by step, and means for automatically cutting the said magnet out of its own calling-circuit.

5. In a telephone system, a contact-plate, a movable bar arranged in the talking-circuit and resting on the said plate, an electromagnet, a generator-gear shaft adapted to move inward when rotated in one direction, and having an insulated conical rear end portion, spring members arranged on opposite sides of said conical end and when in contact completing the circuit through the electromagnet, pawls actuated by the magnet adapted to lift the bar, and a weight connected to the bar and adapted to be brought into alinement with the rear end of the generator-gear shaft and prevent inward movement of the same when the bar is lifted, as and for the purpose set forth.

813,331. OIL-LAMP. Thomas S. Tarling, St. Albans, England. Filed Mar. 27, 1905. Serial No. 252,373.



Claim.—In a lamp, the combination of the lamp-body, a burner-support secured to the top of said body, said burner-support being provided with a stationary guard-plate, spring-operated rods passing through said guard-plate, extinguishing devices carried by the upper parts of said rods, springs located beneath said guard-plate and surrounding said rods, a support for said springs, a weighted rod centrally located in said lamp and carrying a portion adapted to engage with said support, normally preventing its downward movement, and a part adapted to engage the hand of the operator and prevent the movement of said rod when the lamp is moved in the ordinary manner, substantially as described.

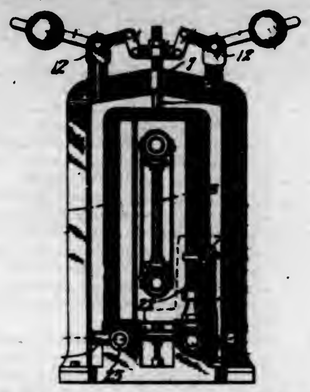
813,332. STEAM-TRAP. John H. Taylor, Battle Creek, Mich. Filed Aug. 5, 1905. Serial No. 272,596.

2. In an animal-trap, the combination of a frame, a platform in the bottom of the frame and hinged to the rear thereof, a pin pro-

structure extending at right angles to the rising portion thereof, a tubular metallic guard for the exposed edge thereof, anchorage

2. In combination, a bit comprising a mouthpiece, attaching members at the ends of the bit, reins connected with the lower por-

813,332. STEAM-TRAP. JOHN H. TAYLOR, Battle Creek, Mich. Filed Aug. 5, 1905. Serial No. 272,806.



Claim.—1. In a device of the class described, a vertically-movable vessel, means for moving the same in one direction, said vessel being movable in the other direction under the weight of its contents, pressure-inlet and exhaust-inlet ducts communicating with the vessel, the latter having a vent-port, a pressure-controlling valve for closing the pressure-inlet duct, a vent-valve for closing the port, means controlled by movements of the vessel for moving the valves in relatively reverse directions, an inwardly-opening valve for closing the exhaust-inlet duct against back pressure, a return-duct leading from the vessel, and an outwardly-opening valve normally closing said return-duct.

2. In a device of the class described, a vertically-movable vessel, means for moving the same in one direction, said vessel being movable in the other direction by the weight of its contents, a pressure-inlet duct communicating with the vessel, the latter having a vent-port, a pressure-controlling valve for closing the duct, a vent-valve for closing the port, said valves being adapted for relatively reverse movement, and an operating-lever having connection with the vessel for operation thereby, and connected with and for actuating both valves.

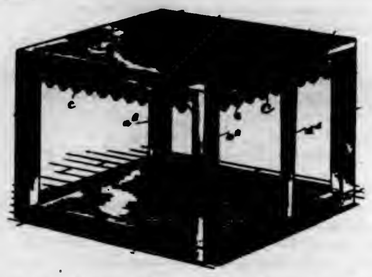
3. In a device of the class described, a vertically-movable vessel, means for moving the same in one direction, said vessel being movable in the other direction through the weight of its contents, pressure-inlet and exhaust-inlet ducts communicating with the vessel, the latter having a vent-port, a pressure-controlling valve for closing the pressure-inlet duct, a vent-valve for closing the port, an operating-lever connected with and for moving the valves in relatively reverse directions, and operative connections between the lever and tank.

4. In a device of the class described, a vertically-movable tank, means for moving the same in one direction, said tank being movable in the other direction by the weight of its contents, a coupling member connected with the tank and having a pair of passages communicating therewith, a pair of flexible ducts coupled to the member and communicating with the tank through the respective passages, a check-valve arranged in one of the ducts, a pressure-controlling valve for closing the outer duct, said tank having a vent-port, a vent-valve for closing said port, and an operating-lever connected with the valves for moving them in relatively reverse directions, said lever being operatively connected with the tank for automatic operation thereby.

813,333. ANIMAL-TRAP. JOHN H. TRAMP, Cherokee, Kans. Filed June 8, 1905. Serial No. 264,291.

Claim.—1. In an animal-trap, the combination of a frame comprising a top and a bottom plate secured together and spaced apart by angular corner-supports, a platform in the bottom of the frame and hinged to the rear thereof, a pin projecting from the side of the platform, a plunger slidably mounted within the corner-supports and provided on its edges with depending teeth, eyes on the upper face of the plunger, a rock-shaft journaled transversely of the frame above the plunger and provided with pins for engaging the eyes thereof, a depending arm on the rock-shaft for engaging the pin on the platform to prevent rotation of the shaft, and a spring for forcibly depressing the plunger when released from the pins.

2. In an animal-trap, the combination of a frame, a platform in the bottom of the frame and hinged to the rear thereof, a pin projecting from the side of the platform, a plunger slidably mounted within the frame and provided on its edges with depending teeth, eyes on the upper face of the plunger, a rock-shaft journaled transversely of the frame and above the plunger, and provided with pins for engaging the eyes thereof, a depending arm on the rock-shaft for engaging the pin on the platform to prevent rotation of the shaft, and means for forcibly depressing the plunger when released from the spring.

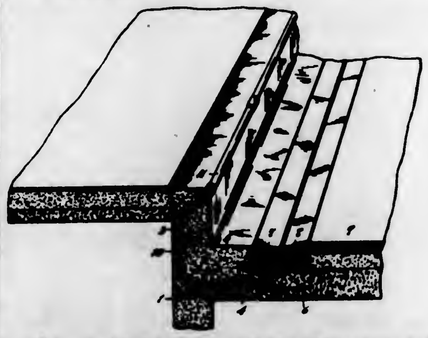


3. In an animal-trap, the combination of a frame, a spring-actuated plunger mounted within the frame and provided on its edges with depending teeth, eyes on the upper surface of the plunger, a rock-shaft journaled in the frame and provided with horizontal projecting pins for engaging the eyes to maintain the plunger in its elevated position, means for preventing rotation of the shaft, and means whereby the entrance of an animal within the frame may actuate said preventing means to release the plunger.

4. In an animal-trap, the combination of a frame, a rock-shaft journaled in the frame a platform hinged within the frame, a spring-actuated plunger mounted in the frame, means on the rock-shaft for retaining the plunger in its elevated position and means whereby the depression of the platform may release the said retaining means.

5. In an animal-trap, the combination of a frame, a rock-shaft journaled in the frame a platform hinged within the frame, a spring-actuated plunger within the frame, means on the rock-shaft for retaining the plunger in its elevated position and means connected with the platform whereby the entrance of an animal upon the platform may release the retaining means.

813,334. REINFORCED CONCRETE CURBING. AVILA THOMAS, Detroit, Mich., assignor of one-half to Eugene F. Glock, Detroit, Mich. Filed Sept. 7, 1905. Serial No. 277,494.



Claim.—1. A curb having in combination with a concrete body having a horizontal and a vertical portion, a guide-rail of circular cross-section for one corner of the vertical portion, and anchor-irons extending therefrom into both body portions of the curb at intervals along its length, substantially as described.

2. In combination with a concrete curb, a tubular metallic guard for the exposed edge thereof, and anchor-irons each bent at a plurality of points along its length attached at intervals along said guard and extending into the concrete mass, substantially as described.

3. In combination with a concrete curb, a branch of the curb

structure extending at right angles to the rising portion thereof, a tubular metallic guard for the exposed edge thereof, anchorage means for the same embedded in the concrete and extending into the branch portion, and paving-blocks supported by the outer end of said branch portion and forming with the remaining part of the branch portion a gutter, substantially as described.

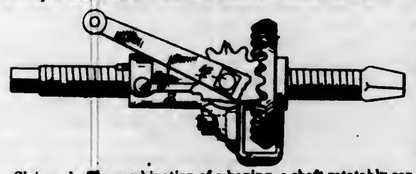
4. A curb, having in combination with a concrete body portion with a plurality of branches, a metallic guard for the exposed edge thereof, and anchor-irons connected therewith and embedded in the concrete and extending into the other branch from that wherein said guard is located, substantially as described.

5. In combination with a concrete curb, having a tread portion branching from the rising portion, a metallic strengthening-bar therefor, and anchor-irons extending therefrom into the branch of the curb not occupied by said bar, substantially as described.

6. In combination with a concrete curb, a longitudinal guide-bar therefor, and angled anchor-irons each extending from said bar into the remote portion of the section of the curb at an angle with the portion of itself immediately adjacent to the bar, substantially as described.

7. A curb, having in combination a body portion of T-shaped cross-section, the stem portion thereof being adapted to lie horizontally, a tabular guard-iron for the exposed edge of the upwardly-extending branch, and anchor-irons extending therefrom into the body of the curb and terminating in said horizontal stem portion, substantially as described.

813,335. DRILLING-MACHINE. ALEXANDER WALKER, What Cheer, Iowa, assignor to What Cheer Tool Company, What Cheer, Iowa, a Corporation of Iowa. Filed Oct. 14, 1905. Serial No. 282,636.



Claim.—1. The combination of a boxing, a shaft rotatably connected with the boxing, the latter having an apertured projection, a gear for turning the shaft, a second gear in mesh with the first gear, a yoke to receive and to hold the second gear in mesh with the first gear, said yoke having a lug to fit the aperture of said projection, and a screw extending from said lug, the projection being perforated to receive the screw, and a nut upon the screw to jam the yoke against the projection.

2. The combination of a boxing, a shaft rotatably connected with the boxing, the latter having a projection, a gear for turning the shaft, a second gear in mesh with the first gear, a yoke to receive and to hold the second gear in mesh with the first gear, said yoke having a lug to engage against said projection, and a screw extending from the lug, the projection being perforated to receive the screw, and a nut upon the screw to jam the yoke against the projection.

813,336. SHEET ROOFING MATERIAL. HENRY R. WARRELL, Ardmore, Pa., assignor to The Barber Asphalt Paving Company, Philadelphia, Pa., a Corporation of West Virginia. Filed Aug. 7, 1905. Serial No. 273,037.

Claim.—A composite roofing sheet comprising a woven fabric and a felted fabric, both saturated with bituminous material, placed in juxtaposition and united together to form a composite sheet; and independent layers of bituminous material on both outer surfaces of the composite sheet, completely incasing the same and protecting it from atmospheric influences, substantially as set forth.

813,337. BRIDLE-BIT AND ATTACHING MEANS THEREFOR. FRANKLIN WHITMORE, Findlay, Ill. Filed May 19, 1905. Serial No. 261,226.

Claim.—1. In combination, a bit comprising a mouthpiece, attaching members at the ends of the bit, reins connected with the lower portion of the attaching members, and a yoke to embrace the neck of the animal connected with the upper portion of the attaching members, and a check-strap connected with the rear portion of the yoke.

3. In combination, a bit comprising a mouthpiece, rings at the end portions of the mouthpiece, loops extended from the upper and lower portions of the rings aforesaid, reins connected with the lower loops of the rings, a rigid yoke to receive the neck of the animal connected with the upper loops of the rings, and a check-strap connected with the rear portion of the yoke.

4. In combination, a bit comprising a mouthpiece, a rigid yoke adapted to receive the neck of the animal, connections between the yoke and the mouthpiece, and means for connecting the yoke with the harness.

5. In combination, harness embodying a check-hook, a bit comprising a mouthpiece, a yoke adapted to receive the neck of the animal, connections between the sides of the yoke and opposite ends of the mouthpiece, and connecting means between the said yoke and the check-hook.

6. In combination, harness embodying a check-hook, a bit comprising a mouthpiece, a yoke adapted to receive the neck of an animal, adjustable connections between the sides of the yoke and opposite ends of the mouthpiece, and adjustable connecting means between said yoke and the check-hook.

813,338. POST. WILLIAM W. WILCOX, Spencerport, N. Y., assignor of one-eighth to Theodore S. Dean and one-eighth to Henry B. McArthur, Brockport, N. Y. Filed Oct. 27, 1905. Serial No. 284,396.

Claim.—1. As a reinforcement for a post, a series of three or more bars longitudinally disposed near and within the sides of the post and a series of tie-rods secured together at intervals longitudinally of the post at points therein lying practically in the center between such bars and by connections preventing a movement of one of such tie-rods upon the other at such connections, such tie-rods radiating obliquely upward and downward in practically straight lines from such common connections to such bars and secured thereto at two or more points longitudinally thereof, whereby each of such bars is connected to the others by tie-rods extending to such common connections in the center between all such bars.

2. As a reinforcement for a post, a series of three or more bars longitudinally disposed near and within the sides of the post and a series of tie-rods secured together at intervals longitudinally of the post at points therein lying practically in the center between such bars and by connections preventing a movement of one of such tie-rods upon the other at such connections, such tie-rods radiating obliquely upward and downward in practically straight lines from such common connections to such bars and secured thereto at two or more points longitudinally thereof by connections preventing motion of such tie-rods and bars upon each other at such connections, whereby each of such bars is connected to the others by tie-rods extending to such common connections in the center between all such bars.

3. As a reinforcement for a post, a series of three or more bars longitudinally disposed near and within the sides of the post and a series of tie-rods twisted together at intervals longitudinally of the post at points therein lying practically in the center between such bars and radiating obliquely upward and downward in practically straight lines from such twisted connections to such bars and inter-

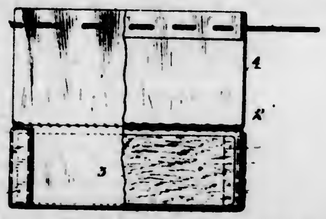
twisted therewith at two or more points longitudinally thereof, whereby each of such bars is connected to the others by tie-rods extending to such twisted connections in the center between all such bars.

4. As a reinforcement for a post, a series of three or more bars longitudinally disposed near and within the sides of the post and a series of tie-rods secured together at intervals longitudinally of the post at points therein lying practically in the center between such bars and by connections preventing a movement of one of such tie-rods upon the other at such connections, such tie-rods radiating obliquely upward and downward in practically straight lines from such common connections to such bars and secured thereto at two or more points longitudinally thereof, whereby each of such bars is connected to the others by tie-rods extending to such common connections in the center between all such bars, and mortises extending transversely through such posts between and encircled by such tie-rods.

5. As a reinforcement for a post, a series of three or more bars longitudinally disposed near and within the sides of the post and a series of tie-rods secured together at intervals longitudinally of the post at points therein lying practically in the center between such bars and by connections preventing a movement of one of such tie-rods upon the other at such connections, such tie-rods radiating obliquely upward and downward in practically straight lines from such common connections to such bars and secured thereto at two or more points longitudinally thereof by connections preventing motion of such tie-rods and bars upon each other at such connections, whereby each of such bars is connected to the others by tie-rods extending to such common connections in the center between all such bars, and mortises extending transversely through such posts between and encircled by such tie-rods.

6. As a reinforcement for a post, a series of three or more bars longitudinally disposed near and within the sides of the post and a series of tie-rods twisted together at intervals longitudinally of the post at points therein lying practically in the center between such bars and radiating obliquely upward and downward in practically straight lines from such twisted connections to such bars and intertwisted therewith at two or more points longitudinally thereof, whereby each of such bars is connected to the others by tie-rods extending to such twisted connections in the center between all such bars, and mortises extending transversely through such posts between and encircled by such tie-rods.

813,339. **HOUSEHOLD-CLEANER.** JULIE WOLFF, New York, N. Y. Filed Jan. 19, 1905. Serial No. 241,777.

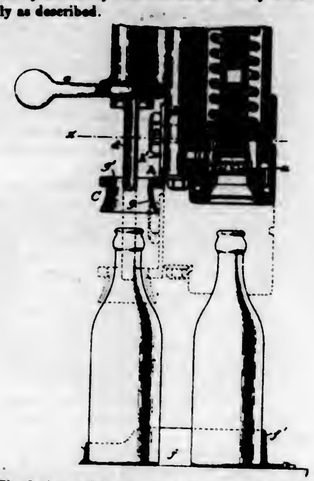


Claim.—A cleaner for household purposes comprising a bag for cleaning compound, the bag having a bottom made of tough, flexible material, having corner-stripe turned up and secured to the bag, the bottom having apertures therein and a flap for closing the said bag.

813,340. **SODA-WATER-BOTTLING MACHINE.** WILLIAM C. WOOD, Baltimore, Md., assignor to The Crown Cork and Seal Company, Baltimore, Md., a Corporation of Maryland. Filed Oct. 21, 1904. Serial No. 229,414.

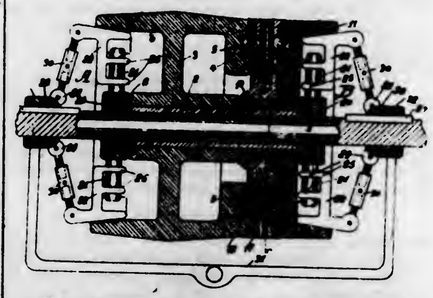
Claim.—1. In a soda-water-bottling machine, the combination with the filling-head restricted to the passage of gaseous liquids, of a pendent syrup-tube, and a flaring annular guide carried at the one side by the head, encircling the tube, extending below its end and affording an annular space ample for the free reception and passage of a bottle-head and its neck, while inclosing the tube, substantially as described.

2. In a soda-water-bottling machine, the combination of a pendent open-mouthed syrup-tube, and a flaring annular guide carried in appropriate relation to the mouth of the tube, adapted to freely receive the head and neck of a bottle, and to guide the head into line with and thereby cause a bottle to inclose said tube, and enable syrup to be directly and freely delivered into the body of the bottle, substantially as described.



3. The flaring annular bottle-guide adapted to cooperate with a syrup-tube in a soda-bottling machine of the class indicated, by allowing the free passage of the heads of bottles guided by it, and provided with a lateral arm terminating in a hanger-plate rectangular to the arm and provided with an accurately-located aperture substantially as described, whereby without any special preparation therefor, the guide may be readily mounted in appropriate relation to the syrup-tube but wholly free therefrom, said aperture then being occupied by a bolt already in the head of the machine, and locked for service by the nut already on said bolt.

813,341. **REVERSING MECHANISM.** IRVIN G. YOCUM, Washington, Pa., assignor of five-eighths to William F. Borchers, Washington, Pa. Filed Feb. 25, 1905. Serial No. 247,287.



Claim.—In reversing mechanism, the combination with a shaft, a pulley loosely mounted on said shaft and having a laterally-extending rim at one side and circularly-disposed teeth on the other side, a clutch-wheel loosely mounted on said shaft and having a laterally-extending rim at one side and having circularly-disposed teeth on the other side, of a spider arranged between said pulley and said clutch-wheel, said spider being mounted upon a collar carried by said clutch-wheel, and pinions carried by said spider and engaging the teeth on the pulley and the teeth on the clutch-wheel, collars mounted on the shaft adjacent the pulley and the clutch-wheel, radially-disposed posts carried by said collars, clutch members slidably mounted on said posts, collars slidably mounted on the shaft and connected together so as to move simultaneously, and turnbuckles connected to said collars and connected to said clutch members.

813,342. **COMBINATION-TOOL.** JEFFERSON D. BARRY, Waco, Tex., assignor of one-fourth to Daniel Winn, one-fourth to Frederick D. Dahn, and one-fourth to Mortimer L. Crossland, Waco, Tex. Filed Sept. 9, 1905. Serial No. 277,742.

Claim.—1. In a combination-tool, the combination of a socket-piece, a handle, and a perforated arm, extending at right angles to said socket-piece, and a sharpening-disk adjustably mounted in said socket-piece, said socket-piece being provided with a notch, one of the walls of which is radial, and the other wall inclined to a radius, substantially as described.

2. In a combination-tool, the combination of a socket-piece, a handle, and an adjustably-mounted sharpening-disk in said socket-piece, said socket-piece being provided with notches, the walls of one of which are parallel, and the walls of another of which are inclined to each other outwardly, substantially as described.

813,343. **SHUTTER-FASTENER.** ALBERT D. BARTLETT, Hampton, Va. Filed Aug. 19, 1905. Serial No. 274,888.

Claim.—1. A shutter-fastener comprising a combined retaining and releasing lever having both of its ends free and secured intermediate its ends to the shutter and having one of its ends provided with a curvilinear hook, combined with a keeper adapted to be engaged by said hook for retaining the shutter in a closed position, an abutment to arrest the movement of the shutter when opening the same, and a spring-catch pivotally connected to the abutment and adapted to engage the shutter for retaining it in an open position, said spring-catch associating with said abutment to prevent the actuating of the shutter when retained in an open position by the catch, and said hooked end of the lever adapted to engage the catch when the lever is operated to release the shutter, thereby permitting of the closing of the shutter.

2. A shutter-fastener comprising a combined retaining and releasing lever, said lever having one end formed with a curvilinear hook and the other end formed with a handle, combined with a keeper adapted to be engaged by said hook for retaining the shutter in a closed position, and a spring-catch adapted to engage the shutter for retaining it in an open position, said hook of said lever adapted to engage and lower the catch when the lever is operated to release the shutter, thereby permitting of the closing of the shutter.

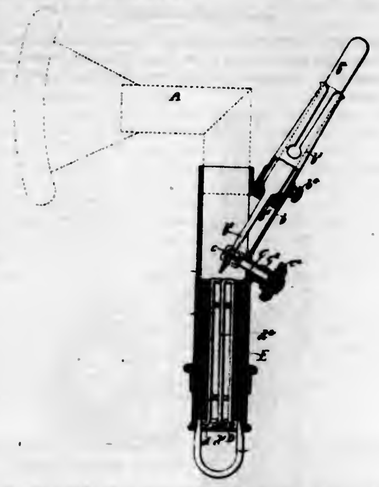
813,344. **INHALER.** CHARLES S. BEIT, Birmingham, England, assignor, by mesne assignments, to E. De Trey & Sons, a Limited Copartnership of Pennsylvania. Filed June 4, 1904. Serial No. 211,169.

Claim.—1. The combination in an inhaler having a tubular branch portion, of an anesthetic-containing tube, means for gripping and removably holding said tube in said branch portion, and means carried by the inhaler for opening said tube to permit liquid to be delivered to the inhaler from said tube, substantially as described.

2. The combination with an inhaler of a device having resilient portions for holding a tube, means for removably retaining said device in position to permit the tube to communicate with the inhaler, and means for opening the tube to permit flow of liquid therefrom into the inhaler, substantially as described.

3. The combination with an inhaler including a main tubular portion having an opening, of means for retaining an anesthetic-containing vessel in a portion projecting adjacent to said opening, and a device rotatable on its axis substantially at right angles to the line of said latter portion of the inhaler for engaging and breaking a portion of the said anesthetic-containing vessel at will, substantially as described.

4. The combination of an inhaler including a tubular structure constructed to receive and hold an anesthetic-containing tube and a spindle having a device constructed to engage the pointed portion of an anesthetic-containing tube and be rotatable on an axis substantially at right angles to the line of said tubular structure, said spindle extending outside of the tubular structure and being provided with a head, substantially as described.



5. The combination of an inhaler including a tubular structure having a branch portion, means for holding an anesthetic-containing tube in said branch portion, a spindle having an eyelet projecting into the branch portion in line with such tube, means for turning the spindle and a spring for holding the spindle in a definite position, substantially as described.

6. The combination in an inhaler of a tubular section having a branch portion, a tubular holding device in said branch portion a device for breaking an anesthetic-tube carried in the holding device and packing in said holding device for making a tight joint between the same and the anesthetic-containing tube, substantially as described.

7. A tube having in one end a series of longitudinal slots and a body of packing in the opposite end, portions of the slotted end of the tube being resilient and serving to hold a liquid-containing tube against said packing, in combination with an inhaler, substantially as described.

8. An inhaler including a tubular portion, with a removable frame and absorbent material supported on said frame in such manner as to leave a free passage for air, substantially as described.

9. An inhaler including a tubular portion open at one end, an elongated frame removably held in said end, and a body of absorbent material on the frame so disposed as to permit an unobstructed flow of air into the inhaler, with an anesthetic-containing vessel and means within the inhaler for opening said vessel to permit the delivery of an anesthetic to said absorbent material, substantially as described.

10. The combination in an inhaler of a casing having an opening, a ring having a frame removably held in said opening, with a body of absorbent material on said frame, an anesthetic-containing tube, and a device within the casing for opening the tube to permit flow of liquid therefrom to said body of absorbent material, substantially as described.

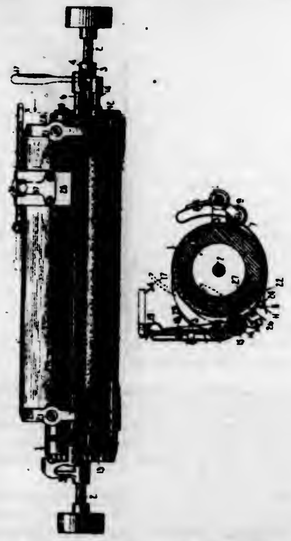
11. The combination in an inhaler of a tubular structure having an opening, a ring carrying a substantially cylindrical frame and movably held in said opening, and a body of absorbent material upon the cylindrical surface of said frame, an anesthetic-containing tube and a device within the structure and operative from without the same for opening the tube to permit liquid to flow therefrom to said absorbent material, substantially as described.

12. The combination with an inhaler of a casing having an opening, a gauze-covered frame removably held in said opening, an elongated frame carried by said first frame, a body of absorbent material on said frame, an anesthetic-containing vessel, and a device within the casing for opening said vessel to permit of flow of liquid therefrom to said absorbent material, substantially as described.

13. The combination in an inhaler of a casing having an opening for air, a frame adjacent to said opening, and a body of absorbent material upon said frame so disposed as to permit the free flow of air into the inhaler, an anesthetic-containing vessel, and a device within the casing and operative from without the same for breaking

said tube to permit flow of liquid therefrom to the absorbent material, substantially as described.

813,845. TYPE-WRITING MACHINE. ARTHUR J. BASSE, Syracuse, N. Y., assignor to The Smith Premier Typewriter Company, Syracuse, N. Y., a Corporation of New York. Filed July 13, 1904. Serial No. 216,989.



Claim.—1. In a type-writing machine, the combination of a platen, a feed-roll, a paper-stop, and means for moving the paper-stop and feed-roll, the feed-roll being revoluble about the axis on which the paper-stop is mounted.

2. In a type-writing machine, the combination of a platen, a feed-roll, a paper-stop, and means for moving the paper-stop and feed-roll, the feed-roll and the paper-stop both being revoluble about the same axis, said feed-roll normally being in contact with the platen, and said paper-stop normally being out of contact with the platen.

3. In a type-writing machine, the combination of a platen, a feed-roll, a paper-stop, and means for moving the paper-stop and feed-roll, the feed-roll and the paper-stop both being revoluble about the same axis, said feed-roll normally being in contact with the platen, and said paper-stop normally being out of contact with the platen, said means first moving the paper-stop into contact with the platen, and afterward moving the paper-feed roll out of contact with the platen.

4. In a type-writing machine, the combination of a platen, a feed-roll, a paper-stop, a finger-piece and means actuated by the finger-piece for moving the paper-stop and the feed-roll, the feed-roll and the paper-stop both being revoluble about the same axis, the feed-roll normally being in contact with the platen and the paper-stop normally being out of contact with the platen, the said moving means first moving the paper-stop into contact with the platen and afterward moving the feed-roll out of contact with the platen, both movements being caused during the travel of the said finger-piece in one direction.

5. In a type-writing machine, the combination of a platen, a feed-roll, a paper-stop, a finger-piece, and means actuated by the finger-piece for moving the paper-stop and feed-roll, the feed-roll and the paper-stop both being revoluble about the same axis, the said means being adapted to move the feed-roll against the sheet so as to frictionally control it and afterward to move the paper-stop out of the path of the leading edge of the sheet, both movements being caused during the travel of the said finger-piece in return direction.

6. In a type-writing machine, the combination of a platen, a feed-roll, a paper-stop, a finger-piece, and means controlled by the finger-piece for moving the paper-stop and the feed-roll, the said finger-piece being movable from normal position in one direction to move the feed-roll out of contact with the platen and movable in another direction to throw the said paper-stop into operative position and to move the said feed-roll out of contact with the platen.

7. In a type-writing machine, the combination of the platen, a feed-roll, a guide-plate, a paper-stop, a finger-piece, means actuated by the finger-piece for moving the paper-stop, the guide-plate and the feed-roll, the said finger-piece being movable from normal position in one direction to move the feed-roll and the guide-plate out of contact with the platen, and movable in another direction to throw the said paper-stop into contact with the platen and then to move the said feed-roll out of contact with the platen.

8. In a type-writing machine, the combination of a platen, a feed-roll, and a paper-guide plate extending longitudinally of the platen and revoluble about a central longitudinal axis, one edge of the guide-plate being provided with a paper-stop and the opposite edge serving to press the paper against the platen.

9. In a type-writing machine, the combination of a platen, a feed-roll, and a paper-guide plate extending longitudinally of the platen, said guide-plate being revoluble about a central longitudinal axial support, both the guide-plate and its axial support being movable bodily to and from the platen, and said feed-roll being also revoluble about the axial support of said guide-plate.

10. In a type-writing machine, the combination of a platen, a feed-roll, a paper-guide plate extending longitudinally of the platen, and revoluble about a central longitudinal axis, the rear portion of said guide-plate serving as a regulator to position and straighten the paper, and being normally out of contact with the platen.

11. In a type-writing machine, the combination of a platen, a revoluble and adjustable side gage or margin regulator serving to position the paper longitudinally of the platen, and a paper-guide plate extending longitudinally of the platen, the rear portion of said guide-plate serving as a regulating-stop to position and straighten the paper along its leading edge or top.

12. In a type-writing machine, the combination of a platen, a pivoted paper-guiding plate having its rear portion, or that part in rear of its pivot, bent outward to form a paper-stop and having its edge forward of the pivot-spring pressed toward the platen, and means for moving said rear portion against the platen.

13. In a type-writing machine, the combination of a platen, a platen-frame, links pivotally connected with said frame, a shaft mounted in said links, a paper-guiding plate pivoted on said shaft and having a portion thereof adapted to operate as a paper-stop, links on said shaft, said links having a rod or shaft mounted in their ends, a pressure-roller mounted on said second shaft, a finger-lever on said second shaft, and means for normally keeping the forward edge of said plate and said roller in contact with the platen.

14. In a type-writing machine, the combination of a platen-frame, a platen, links mounted on said frame, a shaft mounted on said links, links fast on said shaft and extending toward the axis of motion of the first-mentioned links, a shaft fast to the second-mentioned links, a pressure-roller journaled on said last-mentioned shaft, a finger-lever fast to said shaft, a paper-guiding plate journaled on the first-mentioned shaft and having its rear edge formed to operate as a paper-stop, and springs for normally keeping said roller and the forward edge of said plate in contact with the platen.

15. In a type-writing machine, the combination of a platen-frame, a platen, links pivotally connected with the platen-frame, a shaft borne by said links, a paper-guiding plate pivotally mounted on said shaft and provided with a paper-stop, a spring acting to press the forward edge of said plate against the platen, and a lever for moving said links and shaft toward and from said platen.

16. In a type-writing machine, the combination of a platen frame, a platen, a pivoted paper-guiding plate coacting with said platen and provided with a paper-stop at its rear, a spring for keeping the forward edge of said plate normally in contact with said platen, and mechanism for moving said plate bodily into contact with said platen.

17. In a type-writing machine, the combination of a platen-frame, a platen, an adjustable support on said frame, a bent rod slidable in bearings on said support and forming a margin-regulator, and a paper-guide plate extending longitudinally of the platen, the rear portion of said guide-plate serving as a regulating-stop to position and straighten the paper along its leading edge or top.

18. In a type-writing machine, the combination of a platen-frame, a platen, a support slidably connected with a rod of said platen-frame, a bent rod slidable in bearings on said support and forming a margin-regulator, and a paper-guide plate extending longitudinally of the platen, the rear portion of said guide-plate serving as a regulating-stop to position and straighten the paper along its leading edge or top.

19. In a type-writing machine, the combination of a platen-

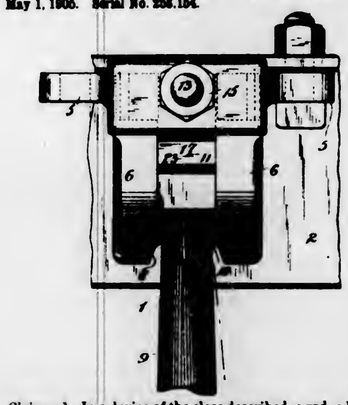
frame, a platen, a support connected with said frame, a bent rod slidably and revolubly connected with said support and forming a margin-regulator, and adapted to be turned out of working position, and a paper-guide plate extending longitudinally of the platen, the rear portion of said guide-plate serving as a regulating-stop to position and straighten the paper along its leading edge or top.

20. In a type-writing machine, the combination of a platen-frame, a platen, a support adjustably connected with said frame, a bent rod slidably and revolubly connected with said support and forming a margin-regulator, and adapted to be turned out of working position, and a spring bearing on said rod and controlling the same.

21. In a type-writing machine, the combination of a platen; a feed-roll; a paper-stop; a finger-piece; and means controlled by the finger-piece for moving the feed-roll out of contact with the platen without bringing the paper-stop into operation, or for moving the feed-roll out of contact with the platen and bringing the paper-stop into operation, as may be desired.

22. In a type-writing machine, the combination of a platen, a side gage or margin-regulator to position the paper longitudinally of the platen, and a paper-guide plate extending longitudinally of the platen, the rear portion of said guide-plate serving as a regulating-stop to position and straighten the paper along its leading edge or top.

813,846. ADJUSTABLE BRAKE-HANGER. GEORGE M. BRILL, Philadelphia, Pa., assignor to John A. Brill, Philadelphia, Pa. Filed May 1, 1905. Serial No. 258,154.



Claim.—1. In a device of the class described, a rod, a ball at the end of said rod, a casing and an adjustable socket resting in said casing and surrounding said ball.

2. In a device of the class described, a rod with a ball at one end, a casing, an adjustable socket mounted in said casing and means for causing said socket to engage said ball.

3. In a device of the class described, a rod with a ball at one end, a casing, an adjustable socket mounted in said casing, a wedge engaging a part of said socket and means for causing said wedge to force the ball and socket together.

4. In a device of the class described, a rod with a ball, a casing, an adjustable socket mounted in said casing and surrounding said ball, one part of said socket having an inclined face, a wedge engaging said inclined face, and springs resting in said wedge and against said casing.

5. In a device of the class described, a rod with a ball, a casing, an adjustable socket resting in said casing, and provided with a plurality of parts, one of said parts having a lip which overlaps a portion of another part, and means for causing the parts of the socket to rest snug against the ball.

6. In a device of the class described, a rod having a ball at one end, a casing, a socket composed of a plurality of parts which are adapted to be forced into an engagement with said ball, a wedge adapted to engage one of said parts, a cap engaging a portion of said casing and a bolt connecting said wedge and cap, whereby the parts of the socket may be forced into engagement with the ball.

7. In a device of the class described, a rod with a ball at one end, a casing, an adjustable socket mounted in said casing, and fitting said ball, said socket being divided into upper and lower sections, the lower section being formed with a plurality of interchangeable parts.

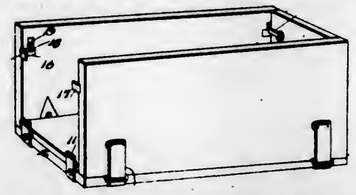
8. In a device of the class described, a rod having a ball at one end, a casing having an elongated slot at its lower portion extending on each side of said rod, an adjustable socket composed of upper and lower sections embracing said ball, a cap and means for connecting said cap and socket, whereby the parts of the socket may be forced into engagement with said ball.

9. In a device of the class described, a rod with a ball at one end, a casing, with adjustable socket mounted in said casing and surrounding said ball, and slot in said casing through which said rod protrudes, means for causing the portions of the socket to engage the ball and covers fixed to said rod and adapted to conceal said slot.

10. The combination with a brake-shoe head, a hanger for supporting or suspending the same, furnished with a ball-and-socket joint to give the head a free and unrestricted motion in all directions and to permit the brake-shoe to properly fit and bear against the wheel at all times when applied thereto and compensate for wear or lack of proper adjustment of parts.

11. In a device of the class described, a hanger for suspending or supporting a brake-beam, provided with a ball-and-socket connection between said hanger and brake-beam and a ball-and-socket connection at the upper end of said hanger between the same and the truck-frame, each of said ball-and-socket connections comprising a ball and a two-part socket surrounding the ball.

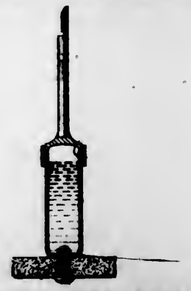
813,847. FOLDING BOX. EDWARD G. BROWN, Glendale, Cal. Filed Apr. 27, 1905. Serial No. 257,738.



Claim.—1. A collapsible crate comprising a bottom and side and end walls, vertically-uprising connecting members carried by the bottom and having inturned engaging flanges, the walls of the crate being provided with sockets to receive said engaging flanges, slotted guide members carried by the walls and slidably disposed upon the connecting members, and means for securing the walls in non-collapsed position.

2. A collapsible crate comprising a bottom and a foldable wall, the latter being provided with a socket, a connecting member carried by the bottom and having an inturned flange designed to enter said socket, a slotted guide member carried by the wall and slidably engaged with the connecting member, and means for securing the wall in non-folded position.

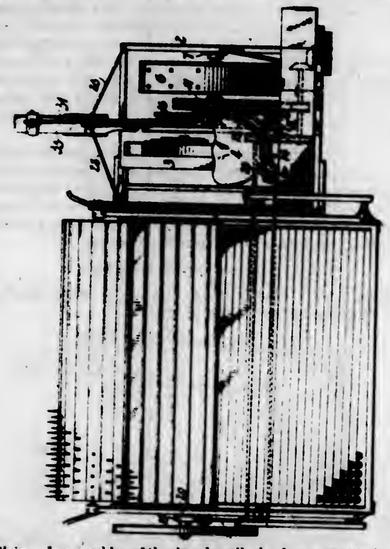
813,848. GRINDING STONE AND DISK EMPLOYED IN MECHANICAL AND OPERATIVE DENTISTRY. HARRY SANFORD-BURTON, Oxford, England. Filed July 31, 1905. Serial No. 271,967.



Claim.—1. A spindle having a hollow enlarged end forming a closed water-reservoir, and a grinding-stone secured to the outer extremity of said spindle, said reservoir provided with openings forming communications with the stone for supplying water thereto.

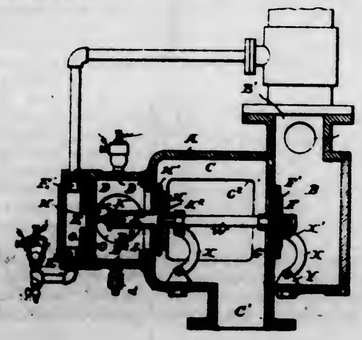
2. A spindle having a hollow end forming a closed reservoir and provided with an inlet-port for supplying water thereto, a grinding-stone secured to the said spindle, said hollow end provided with openings forming conduits for supplying water to the stone, and an annular ring slidable on the spindle for closing the inlet-port.

813,349. PLATFORM-ADJUSTING MEANS FOR SEED-HARVESTERS. THOMAS J. CAMPBELL, Lathrop, Mo. Original application filed June 20, 1904. Serial No. 213,269. Divided and this application filed July 19, 1904. Serial No. 217,214.



Claim.—In a machine of the class described, a frame, supporting-wheels at the sides of the frame, means for vertically adjusting the frame at one side, consisting of a curved rack on the frame, a gear-wheel loose on the supporting-wheel axle and meshing with said rack, a sheave rotatable with said gear-wheel, a shaft having means for rotating it, a drum fixed on said shaft, a cable partly wound at its ends respectively on said drum and on said sheave, means for simultaneously vertically adjusting the frame at its other side, consisting of a second drum on said shaft, vertical parallel guides on the frame, a bracket movable in said guides and carrying the axle for the other supporting-wheel, a sheave on the bracket above said axle, idler-sheaves on the frame, a cable attached at its ends respectively to the frame and last-named drum and intermediately passed around the bracket-sheave and idler-sheaves, and means independent of the aforesaid means for vertically adjusting the frame at its front.

813,350. DRY-PIPE VALVE FOR AUTOMATIC SPRINKLER SYSTEMS. ELMER S. CLAYTON, Newark, N. J. Filed Mar. 18, 1905. Serial No. 250,233.



Claim.—1. In an apparatus of the character described, a casing containing four chambers, two in communication with distributing-pipes and both containing air under pressure, one in communication with a source of water-supply under pressure, and the other under atmospheric pressure, a valve closing the communication between the water-supply chamber and that under atmospheric pressure, and arranged to seat under the water-pressure, a second valve fitted to a port of less diameter than the first seating against the water-pressure and closing the communication between the water-chamber and one of those under air-pressure, and means whereby a reduction of pressure in the air-pressure chambers causes said valves to be opened, substantially as set forth.

2. In an apparatus of the character described, the combination with a casing having two chambers communicating independently with distributing-pipes normally containing air under pressure, a water-chamber communicating with a source of water-supply under pressure, a chamber under atmospheric pressure, a port between the latter chamber and the water-chamber, a port of less diameter between the water-chamber and one of the air-pressure chambers, connected valves fitted to said ports, the smaller closing under air-pressure against the water-pressure, and the larger under the water-pressure, and means for equalizing the water-pressure on both sides of the larger valve on the reduction of pressure in the distributing-pipes and air-pressure chambers, substantially as set forth.

3. In an apparatus of the character described, the combination with a valve-casing having four chambers, one of the chambers being connected to be normally under water-pressure, of passages connecting said chamber to two other chambers, one under atmospheric pressure and the other under air-pressure in excess of atmospheric pressure, a diaphragm interposed between the air-pressure and atmospheric-pressure chambers, a valve-stem supporting valves controlling the passage between the water, air and atmospheric chambers, and a valve controlling the passages between the water and atmospheric chambers and seated under air-pressure, substantially as set forth.

4. In an apparatus of the character described, the combination with a valve-casing having a chamber connected to be normally under water-pressure, a riser-chamber normally under air-pressure, and an auxiliary chamber under atmospheric pressure, of passages between the water-chamber and both the riser and auxiliary chambers, a valve having gates closing both said passages under water-pressure, and a third valve seated against the water-pressure by air-pressure, substantially as described.

5. In an apparatus of the character described, the combination with a valve-casing having a chamber connected to be normally under water-pressure, a riser-chamber normally under air-pressure, and an auxiliary chamber under atmospheric pressure, of passages between the water-chamber and both the riser and auxiliary chambers, a valve having gates closing both said passages under water-pressure, a third valve, and diaphragm connected therewith whereby to seat said valve by air-pressure against the water-pressure, substantially as described.

6. The combination with the valve F controlling the port between the air and water chambers of an automatic fire-extinguisher, and seated under air-pressure, of a connected valve H seated under water-pressure to hold the air-pressure valve to its seat, and means whereby to admit the water-pressure to both sides of the valve H on a reduction of the air-pressure, substantially as set forth.

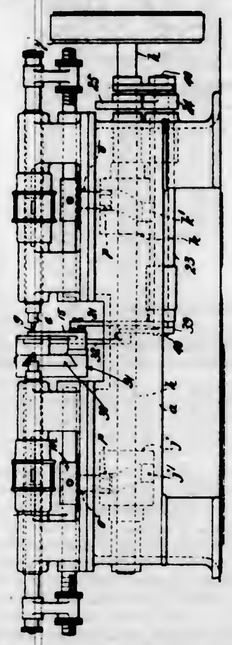
7. The combination of the casing having a chamber communicating with a water-supply, a chamber under air-pressure, and one under atmospheric pressure, with a port between the water-chamber and each of the other chambers, a valve having two connected heads closing said ports under water-pressure, a second port between the chamber under atmospheric pressure and the water-chamber, a valve closing said port, and a diaphragm maintained on said latter valve by air-pressure, substantially as set forth.

8. In an apparatus of the character described, the combination with a valve having a water-chamber connected to be normally under water-pressure, an auxiliary chamber under atmospheric pressure, and a diaphragm-chamber under air-pressure, of a valve having a tubular extension, a gate for the passage between the water-chamber and auxiliary chamber, and a movable gate controlling the opening of the tubular extension and controlled by the diaphragm, substantially as described.

9. In an apparatus of the character described, the combination with a valve-casing having a chamber, of a gate closing the chamber at one side, a tubular extension through the gate, a diaphragm closing the chamber at the other side, and an independent loose gate normally closing the tubular extension under the influence of the diaphragm and supported to fall from normal position when the diaphragm is moved, substantially as described.

10. In an apparatus of the character described, the combination with a valve having a water-chamber connected to be normally under water-pressure, a riser-chamber under air-pressure, an auxiliary chamber under atmospheric pressure, a diaphragm-chamber under air-pressure, and a diaphragm between the diaphragm-chamber and auxiliary chamber, of a triple-seated valve having gates controlling the passages between the water-chamber and riser-chamber and water-chamber and auxiliary chamber and a tubular extension into the auxiliary chamber, and an independent gate controlling said tubular extension and controlled by the diaphragm, substantially as described.

813,351. DRILLING-MACHINE. FRANCIS W. CLOUGH, Springfield, Mass., assignor to Nelson C. Newell, Springfield, Mass. Filed Sept. 27, 1904. Serial No. 226,147.



Claim.—1. In a button-drilling machine, a drill and a router in axial alinement, a work-holder arranged between said tools, and transversely movable from one position to another, means for intermittently advancing the drill and retracting the same, means for advancing and retracting the router, in unison with the drill, and for maintaining it in partially-advanced position while the drill is retracted, then again advancing the router in unison with the drill and retracting it to its full extent, and suitable driving mechanism for the drill and router.

2. In a button-drilling machine, two drills in axial alinement and movable toward and from each other, a work-holder, drill-controlling mechanism comprising means for causing both drills to first move toward each other in the operation of forming each eye in the button and then causing one drill to advance and the other retire in the operation of completing each eye, and means for effecting an automatic movement of the work-holder transversely of the axis of the drills while one of the same is in its retired position and the other partly advanced within the plane of the button said movement serving to rout out a channel between the eyes by the latter drill.

3. In a machine of the character described, a spindle, suitable bearings therefor, sleeves in said bearings extending one toward the other, a pulley mounted on said sleeves between the bearings, and a pin extending transversely of the pulley through a longitudinally-disposed slot in said spindle, whereby the latter may move endwise through the pulley and be rotated thereby.

813,352. LOG-DERRICK. HARRY COMBS, Upson, Wis. Filed Sept. 15, 1905. Serial No. 278,280.

Claim.—A derrick comprising a base-frame, a rectangular mast-frame connected to the base-frame by a horizontal axis, a vertically-pivoted mast carried by the mast-frame, a boom-arm hinged to the mast, a guy-cable connecting the outer end of the boom to the upper end of the frame, inclined and detachable strut-braces arranged between the base-frame and the mast-frame, guy-cables connecting the top of the mast-frame to the base-frame and turnbuckles in said cables for tightening up the same and holding the mast-frame against the inclined braces.

813,353. INSULATOR. HUNTINGTON B. CROUSE, Syracuse, N. Y. Filed Apr. 18, 1904. Serial No. 203,738.

Claim.—1. The combination with a base of insulating material, of a cup-shape insulator resting on the base and provided with a central aperture in its bottom, a metal socket loosely fitted in the insulator and a pair of terminals, one of which is electrically connected to the metal socket and the other bearing on the base and extending outside of the insulator and provided with a contact-piece projecting through the central aperture in the insulator and a screw passing through the base and connecting said terminal and said contact-piece.

2. The combination with a base of insulating material, a cup-shape insulator having its bottom resting upon the base and provided with a central aperture and an annular flange surrounding said aperture, an electric contact-piece secured to the base and projecting through said aperture, a metal socket loosely fitted in the insulator and removable therefrom, and a terminal in electrical contact with the socket and secured to the base said terminal having forked ends fitting around said flange.

3. A cup-shape insulator having an end wall or bottom provided with a central opening surrounded by an annular flange in combination with a metal socket having bottom flanges resting upon the bottom of the insulator at opposite sides of the flange.

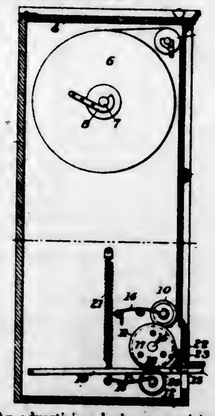
4. An insulator for receiving metal sockets for fuse-plugs and similar devices, said insulator consisting of a cylindrical shell of insulating material having an end wall provided with a central open-

ing, and a recess in its end face extending laterally from the opening through the side of the shell, said bottom being also provided with an annular flange surrounding the opening.

5. An insulator consisting of a cylindrical shell of insulating material having a transverse wall, with a central opening therethrough and with a recess in one of its end faces extending laterally through one side of the shell, and having an annular flange surrounding the central opening, in combination with a socket loosely fitted in the insulator, and formed with bottom flanges, a terminal having a bifurcated end embracing said flange of the insulator and resting on the flanges of the socket, a second terminal extending under the insulator, a base on which the insulator is mounted, a screw extending through said base and through said second terminal and a contact-block arranged in the central opening of the insulator, said screw screwing into said contact-block, substantially as described.

6. An insulator for the purpose described, consisting of a cylindrical shell of insulating material having a transverse wall provided with a central opening therethrough and with a recess in one of its end faces extending laterally through one side of the shell, said shell being also provided with an additional opening at one side of the central opening and extending through the adjacent side of the shell, and an annular flange surrounding the central opening and separating it from the additional opening.

813,354. ADVERTISING DEVICE. ELMETTA C. CROW, Allegheny, Pa., assignor of one-half to Alonzo B. McClure, Allegheny, Pa. Filed June 1, 1905. Serial No. 263,233.



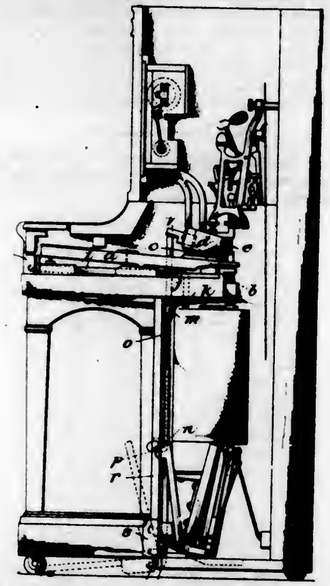
Claim.—1. An advertising device, comprising a case having a transparent panel, a roll of paper having advertisements thereon and supported in said case at one side of the panel, the case having a discharge-opening at the opposite side of the panel, and means whereby successive portions of the paper, each of a determinate length and each bearing a definite positional relation to the said panel may be drawn off from the roll by a free edge protruding through the discharge-opening; substantially as described.

2. An advertising device comprising a case having a transparent panel, a roll of paper having advertisements thereon, and supported in said case at one side of the panel, the case having a discharge-opening for the free edge of the paper at the opposite side of the panel, a feed-roller adjacent to the discharge-opening, and pawl-and-ratchet means in connection with the feed-roller for definitely limiting the length of paper which can be drawn over the feed-roller; and also for causing each such length to bear a definite positional relation to the said panel substantially as described.

3. In an advertising device, a casing having a display-opening, and a discharge-opening, a paper-supply roll, carrying paper having advertisements thereon and arranged to be drawn out through the discharge-opening, and means whereby each drawing operation is limited to a definite length of paper bearing a definite positional relation to the display-opening; substantially as described.

813,355. SELF-PLAYING PIANO. JOHN W. DARLEY, Jr., Baltimore, Md., assignor to William Knabe & Company Manufacturing Company, Baltimore, Md., a Corporation of Maryland. Filed Sept. 26, 1905. Serial No. 280,224.

Claim.—1. In a self-playing piano, the combination of keys, a gravity-operated locking-bar for said keys, means for holding said locking-bar out of engagement with said keys, and mechanism for withdrawing said means operated by the movement of the pedal-board, substantially as described.



2. In a self-playing piano, the combination of keys, a locking-bar for said keys, means for holding said locking-bar out of engagement with said keys, and connections for withdrawing said holding means by the operation of the pedal-board, substantially as described.

3. In a self-playing piano, the combination of keys, a locking-bar for said keys, means for holding said locking-bar out of engagement with said keys, a pedal-board, and means for locking and unlocking said pedal-board, substantially as described.

4. In a self-playing piano, the combination of keys, a gravity-operated locking-bar for said keys, a pivoted pedal-board, means operated by said pedal-board for holding said bar out of engagement with said keys, and means for locking and unlocking said pedal-board, including a pivoted key-slip and connections between said key-slip and said pedal-board, substantially as described.

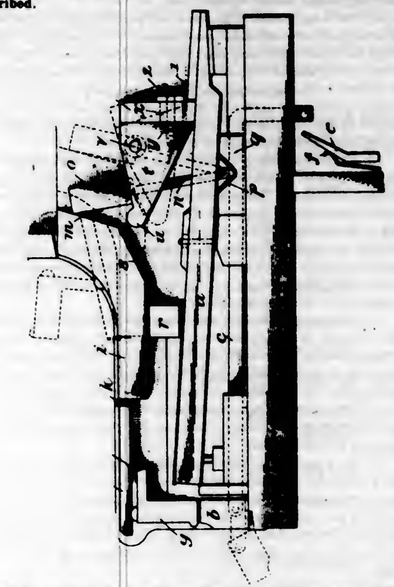
5. In a self-playing piano, the combination of keys, a locking-bar for said keys, a pivoted pedal-board, a push-rod connected to said pedal-board, and holding said locking-bar out of contact with said keys when the pedal-board is folded up, means for locking said pedal-board, including a hooked rod, a pivoted key-slip, and a rod operated by said key-slip for moving said rod, substantially as described.

6. In a self-playing piano, the combination of a pivoted pedal-board provided with a catch, a rod provided with a hooked end, a spring bearing against said rod, a pivoted key-slip, and a bent rod attached thereto and carrying a pin, said pin being adapted to strike said rod and unlock said pedal-board when said key-slip is folded down, substantially as described.

813,356. SELF-PLAYING PIANO ATTACHMENT. JOHN W. DARLEY, Jr., Baltimore, Md., assignor to William Knabe & Company Manufacturing Company, Baltimore, Md., a Corporation of Maryland. Filed Sept. 26, 1905. Serial No. 280,225.

Claim.—1. In a self-playing piano attachment, the combination of keys, means for locking said keys, and a movable lid, said lid being adapted to engage with said means to throw it out of operation when desired, substantially as described.

2. In a self-playing piano attachment, the combination of keys, means for locking said keys, a lid composed of parts hinged together and adapted to be slid backward to strike a part of said locking means and thereby disengage them from said keys, substantially as described.



3. In a self-playing piano attachment, the combination of pivoted keys, a bar supported on pivoted brackets for locking said keys, and a movable lid, the parts being so arranged that the lid when slid backward strikes said brackets and prevents said bar from locking said keys, substantially as described.

4. In a self-playing piano attachment, the combination of keys, a lid composed of parts hinged together and having a beveled portion and adapted to be slid backward into the piano, a pivoted bracket located on each side of said piano, and a locking-bar adjustably secured to said brackets, said brackets being so arranged that the beveled portion of the lid as it is slid backward strikes said brackets and lifts said bar out of contact with said keys, substantially as described.

5. In a self-playing piano attachment, the combination of a lid composed of three parts hinged together, the rear part having a beveled portion, said lid being adapted to slide backward into said piano, a lever hinged to the rear part of said lid, keys, a bracket pivoted to each side of the piano, and a locking-bar for said keys adjustably connected to said brackets, the parts being so arranged that the beveled portion of the lid will strike said brackets when it is slid backward and lift said locking-bar out of contact with said keys, substantially as described.

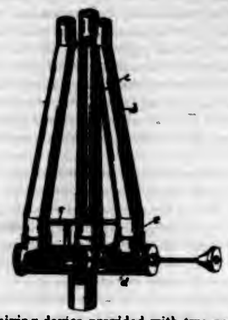
6. In a self-playing piano attachment, the combination of means for unlocking the self-playing piano part, and means for locking said keys against movement or unlocking them at the will of the operator, substantially as described.

7. In a self-playing piano attachment, the combination of means for unlocking the self-playing portion, keys, pivoted brackets carrying a locking-bar for said keys, and a sliding lid adapted when slid backward to strike said brackets and lift said bar out of contact with said keys, substantially as described.

8. In a self-playing piano attachment, the combination of a key-slip and a bar operated thereby to release the self-playing portion of the piano, keys, a locking-bar for said keys, brackets pivoted to the sides of the piano supporting said bar, and a hinged and sliding lid adapted, when slid back, to strike said brackets and lift said bar out of engagement with said keys, substantially as described.

813,357. GAS-LIGHT SWITCH. THOMAS A. DAVIS, Findlay, Ill. Filed May 17, 1905. Serial No. 260,897.

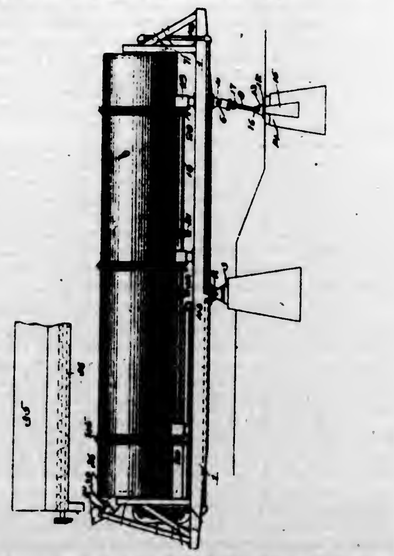
Claim.—1. The plunger-cylinder, provided with a port at each end and one at the center, a gas-pipe communicating with each port, combined with a rod equipped with a valve having a small hole through it from side to side, which valve is adapted to be moved from side to side of the central port, and supports and stops for the rod in the cylinder.



2. A gas-receiving device provided with two ports at opposite points and a central port and pipes communicating with said ports, combined with a valve consisting of a flexible disk on the said rod having a gas-tight fit on the inside of the cylinder and backed upon both sides by metallic disks smaller in diameter than said valve movable from side to side of the central port, and means for moving said valve.

3. A gas-receiving device consisting of a horizontal cylinder with two ports at opposite points and a central port and pipes communicating with said ports, combined with short tubes extending inward a short distance from each end of the cylinder, a plunger-rod adapted to move longitudinally in said cylinder and pipes, a valve on said rod to control the said ports, and to be stopped by abutting against the inner ends of said tubes.

813,358. DRYING APPARATUS. CLARENCE M. DAVISON, Newburgh, N. Y. Filed Mar. 7, 1905. Serial No. 248,888.



Claim.—1. In an apparatus of the class described, the combination of a pivotally-mounted frame, adjusting means for said frame, said adjusting means comprising a movable hollow member secured to said frame, a revoluble, threaded bolt positioned within said hollow member, a threaded, apertured member, said revoluble bolt positioned within said apertured member, and sand-drying means carried by said frame.

2. In a drying apparatus, the combination with a support, a revoluble cylinder journaled upon said support, of removable heads carried by said support and closing the ends of said cylinder, a valved hopper secured to one of said heads, a weighted door secured

to the other head, a steam-pipe positioned within said cylinder, and means for driving said cylinder.

3. In a drying apparatus, the combination of an adjustable frame, a revolvable cylinder journaled upon said frame, longitudinal ledges secured within said cylinder, a single tubing coiled around said cylinder and partly surrounding said ledges, removable means closing the ends of said cylinder, a vacuum-pump connected to one end of said cylinder, inlet and outlet tubings connected to said coiled tubing positioned within the cylinder, a valved hopper carried by the means closing one of the ends of said cylinder, and means for driving said cylinder.

4. In a drying apparatus, the combination of an adjustable frame, a cylinder carried by said frame, removable heads carried by said frame and closing the ends of said cylinder, a steam-pipe secured within said cylinder, inlet and outlet tubings secured upon said frame, coupling devices connecting said tubings and steam-pipe, valved inlet and outlet means formed upon said heads, and means for imparting movement to said cylinder.

5. In a drying apparatus, the combination with a support, of a frame movably mounted off center upon said support, adjusting means for said frame, said adjusting means comprising a revolvable member, supporting means for said member, means connecting said member to said frame, parallel shafts journaled upon said frame, grooved bearings secured to said shaft, a cylinder, annular members substantially V-shaped in cross-section secured to the outer surface of said cylinder, said annular members resting within the grooved portions of said bearings, means for driving said shafts and imparting rotary movement to said cylinder, removable heads secured within the ends of said cylinder, one of said heads provided with a valved hopper, the other head provided with a weighted door, longitudinal ledges secured within said cylinder, a continuous tubing positioned between said ledges, stationary inlet and outlet tubings secured to said frame, and an adjustable coupling connecting said stationary tubings and the tubing secured within said cylinder.

6. In an apparatus of the character described, the combination with a support, of a pivotally-mounted frame carried by said support, adjusting means for said frame, said adjusting means comprising a pivotally-mounted cup-shaped member, a bolt provided with a head, the headed portion of said bolt being positioned within said cup-shaped member, an annular member positioned upon said bolt and secured to said cup-shaped member, a supporting member provided with parallel extensions carried by said support, a threaded block movably mounted upon the parallel extensions of said supporting member, said bolt threaded into said block, and drying means carried by said frame.

7. In an apparatus of the class described, the combination with a support, of a movable frame carried by said support, an adjusting device for said frame, said adjusting device comprising a hollow member pivoted at one end to said frame, a revolvable member having one end positioned within said hollow member, an annular member positioned upon said revolvable member and fixedly secured to said hollow member, a pivotally-mounted member carried by said support, said revolvable member threaded into said pivotally-mounted member, and drying means carried by said movable frame.

8. In an apparatus of the character described, the combination with a support, of a frame pivotally mounted upon said support, an adjusting device for said frame, said device comprising a movable, substantially cup-shaped member pivotally secured to the bottom of said frame, a revolvable member, means connecting said revolvable member to said support, and drying means carried by said frame.

9. In an apparatus of the character described, the combination with a support, of a revolvable cylinder carried by said support, stationary pipes carried by said support, a pipe positioned within said cylinder, coupling devices connecting the ends of said pipe within said cylinder with the stationary pipes, each of said coupling devices comprising a primary member provided with a threaded end and an integral, internal, depending portion, a slidable, auxiliary member positioned within said primary member, said auxiliary member provided with an annular extension formed upon one end thereof, the annular extension positioned between the internal, depending portion and the threaded portion of the primary member, a ring positioned within and engaging the threaded portion of said primary member, and a gland positioned upon said auxiliary member and secured to said primary member.

10. In an apparatus of the character described, the combination with a support, of a movably-mounted frame carried by said support, an adjusting device for said frame, said adjusting device comprising a rotatable member pivotally mounted upon said frame, a movable member carried by said support, the lower portion of said revolvable member threaded into said movable member carried by the support, and drying means carried by said frame.

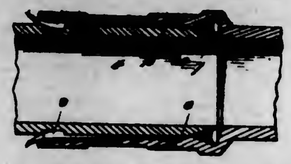
11. In an apparatus of the character described, the combination with a support, of a movable frame carried by said support, an adjusting device for said frame, said adjusting device comprising a hollow member provided with an open bottom and a closed top, pivotally secured to the bottom of said frame, a movable member carried by said support, and vertically-adjustable means supported by said movable member and having its upper portion positioned within said member, and drying means carried by said frame.

12. In an apparatus of the character described, the combination with a support, of a movable frame carried by said support, an adjusting device for said frame, said adjusting device comprising an inverted, substantially cup-shaped member pivoted to said frame, revolvable means carried by said support and positioned within said substantially cup-shaped member, parallel shafts carried by said frame, bearings fixedly secured to said shafts, a cylinder carried entirely and driven by said bearings, and drying means carried by said frame and positioned within said cylinder.

13. In an apparatus of the character described, the combination with a support, of a movable frame carried by said support, parallel, horizontal shafts positioned upon said frame, bearings fixedly secured to each of said shafts, a cylinder carried entirely and driven by said bearings, drying means positioned within said cylinder, an adjusting device for said frame comprising an inverted, receiving member, and revolvable means seated within said receiving member and connected to said support.

14. In an apparatus of the character described, the combination with a pivotally-mounted frame, of an adjusting device for said frame, said adjusting device comprising a member, constituting a container, pivotally secured to said frame, and adjusting means for lifting said frame and retaining it in an adjusted position, having one end seated within said container, and drying means carried by said frame.

818,359. **HOSE-COUPLING.** EARL J. W. DE FOREST and FRED I. DE FOREST, Brainer, Okla. Filed June 27, 1905. Serial No. 267,209.



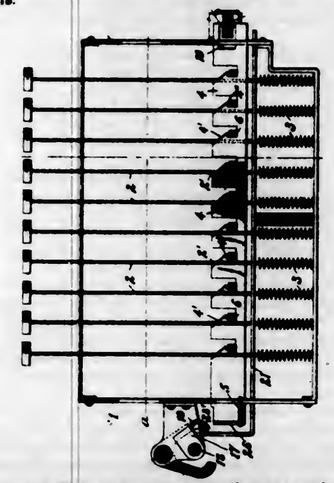
Claim.—1. In a hose-coupling, the combination of an outer ferrule or casing provided with a recess having an inclined face, an inner ferrule fitting within the outer ferrule and having an oppositely-inclined face, a gasket having an approximately triangular cross-section, two sides of which fit against the before-mentioned oppositely-inclined faces, while the third side is formed with a depression or groove so that the pressure of the water forces the sides of the groove tightly against the outer and inner ferrules respectively and forms an extremely tight joint, and means for holding the two ferrules together.

2. In a hose-coupling, the combination of an outer ferrule having an annular groove in its inner face and also a series of longitudinal grooves extending from the annular groove to the end of the ferrule, spring-catches fitting in the before-mentioned longitudinal grooves and provided at their inner ends with projections which are secured in the annular groove, and an inner ferrule fitting within the outer ferrule and having an annular groove which is engaged by the spring-catches to lock the outer and inner ferrules together.

3. In a hose-coupling, the combination of an outer ferrule having two annular grooves in its inner face and also a series of longitudinal grooves extending from the outer annular groove to the end of the ferrule, the inner annular groove having an inclined face, spring-catches fitting in the before-mentioned longitudinal grooves and having one end secured in the before-mentioned outer annular groove while the opposite end extends beyond the end of the ferrule to form a finger-piece, an inner ferrule fitting within the outer ferrule and having an inclined portion which comes opposite the inclined face of the inner annular groove and also having a recess which is engaged by the spring-catches to lock the outer and inner ferrules together, and a gasket having a wedge-shaped cross-section and fitting against the inclined face of the annular groove in the outer ferrule and the inclined portion of the inner ferrule.

4. In a hose-coupling, the combination of an outer ferrule having a series of longitudinal grooves in the inner face thereof, spring-catches operating in said longitudinal grooves, and an inner ferrule fitting within the outer ferrule and having a recess adapted to engage with the spring-catches to hold the two ferrules together.

818,360. **KEYBOARD-LOCKING MECHANISM FOR MECHANICAL CASHIERS, REGISTERS, AND RECORDERS.** ISAAC S. DENNY, East Orange, N. J., and FOURTH J. HULL, Brooklyn, N. Y., assignors, by mesne assignments, to City Trust Company of New York, trustee, a Corporation of New York. Filed Oct. 3, 1901. Serial No. 77,473.



Claim.—1. A keyboard mechanism for the purposes described comprising groups of keys representing different denominations, the keys of different groups being capable of operation in a predetermined order of sequence, means actuated by any key of one group to lock the keys of groups out of said predetermined order of sequence.

2. A keyboard mechanism for the purposes described comprising normally unlocked groups of keys representing different denominations, the keys of different groups being capable of operation in a predetermined order of sequence, means actuated by any key of one group to lock the keys of the next group out of said order of sequence.

3. A keyboard mechanism comprising a plurality of groups of keys, each group representing a member of a serial order and any key in any group being capable of initial operation, in combination with locking means operative by the actuation of any key in any group to lock all the other groups except one.

4. A keyboard mechanism for the purposes described, comprising keys arranged in groups of different denominations and devices controlled by the operation of each group to lock the keys of the groups of lower denominations except the adjacent group.

5. A keyboard mechanism for the purposes described comprising groups of keys representing different denominations, the keys of different groups being capable of operation in a predetermined order of sequence, and devices controlled by the operation of each group to lock the keys of all the other groups except the one next in said predetermined order of sequence.

6. A keyboard mechanism comprising a plurality of keys arranged in groups, any key of which is capable of initial operation, an interlocking mechanism acting upon all the groups and controlling the order of their operation, said interlocking mechanism operated by any key of any group to lock all the other groups of keys except one.

7. A keyboard mechanism comprising a plurality of groups of keys any key of which is capable of initial operation, the several groups together representing a serial order, and locking means actuated by the operation of any key in any group to lock all the groups except the one next in the serial order.

8. The combination of a plurality of groups of keys and slides corresponding to and operated by the keys of each group, each slide having projecting means engaging with the keys of another group to control the operation thereof.

9. The combination of a plurality of groups of keys and slides corresponding to and operated by the keys of each group, each slide having projecting wings adapted to engage the keys of another group.

10. The combination of a plurality of groups of keys representing different denominations, the keys of the different groups being capable of operation in a predetermined order of sequence, and means controlled by the keys of each group to prevent simultaneous operation of keys of adjacent groups.

11. The combination of a plurality of groups of keys, slides operated by the respective groups, and a plurality of locking devices, each locking device engaged by one of said slides and controlled by the same, and each locking device having portions engaging the others of said slides to lock the same.

12. The combination of a plurality of groups of keys, slides operated by the respective groups, a plurality of locking devices each locking device having a portion engaged by one of the key-operated slides to control the operation of said locking device, a portion engaged by another of the key-operated slides to reset the locking device, and portions engaging other key-operated slides to lock the last-named slides.

13. A keyboard mechanism for the purposes described, comprising groups of keys and locking devices controlled by the keys of one group to lock all the other groups of keys except one, the keys of the unlocked group having connection with the locking devices whereby when one of said keys is actuated it will unlock the said locking devices.

14. A keyboard mechanism for the purposes described comprising groups of keys, locking devices controlled by the keys of one group to lock all the other groups of keys except one, means actuated by the keys of the unlocked group to release some of the locking devices, and independent means for releasing the other locking devices.

15. In a keyboard mechanism, a plurality of rows or groups of keys, interlocking mechanism coöperating with said rows or groups whereby an initial operation of a key in an intermediate row or group locks the keys of the row or group on one side thereof and leaves unlocked the keys of the adjacent group on the opposite side thereof.

16. In a keyboard mechanism, a plurality of groups of keys, the keys of any one of which are capable of initial operation, and mechanism coöperating with said groups whereby the operation of a key in one group leaves unlocked the keys of an adjacent group and the operation of a key in such adjacent group locks the keys in the first-mentioned group.

17. A keyboard mechanism for the purposes described comprising groups of keys representing different denominations, the keys of different groups being capable of operation in a predetermined order of sequence, means actuated by any key of one group to lock the keys of groups out of said predetermined order of sequence, and a locking device for all the keys and means for releasing said locking device.

18. A keyboard mechanism comprising a plurality of groups of keys, each group representing a member of a serial order and any key in any group being capable of initial operation, in combination with locking means operative by the actuation of any key in any group to lock all the other groups except one, and a universal locking device to lock all the keys, and means for releasing said locking device.

19. A keyboard mechanism comprising a plurality of groups of keys any key of which is capable of initial operation, the several groups together representing a serial order, and locking means actuated by the operation of any key in any group to lock all the groups except the one next in the serial order, and a universal locking device to lock all the keys and means for releasing said locking device.

818,361. **ADDING AND RECORDING MACHINE.** ADOLPHUS S. DENNIS, Cleveland, Ohio. Filed Feb. 20, 1905. Serial No. 246,420.

Claim.—1. In an adding and recording machine, mechanism adapted to add, combined with mechanism adapted to print, power means for automatically operating said mechanisms jointly and simultaneously, keys to throw said power means into action, carrying and feeding means for the paper printed on, and automatic power mechanism adapted to operate said carrying and feeding means.

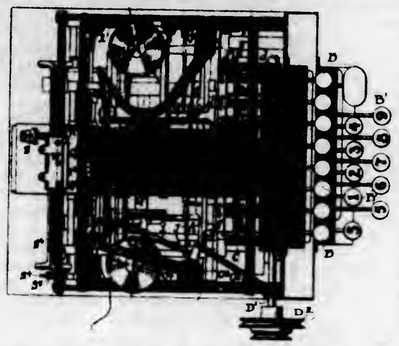
2. In an adding and recording machine, adding mechanism and printing mechanism, and power means providing variable actuation of both said mechanisms, a movable feed-carriage for the paper and power actuating mechanism adapted to regulate the movement of said carriage in opposite directions, a series of selector-key levers for said adding and printing mechanism, and a series of selector-key levers for said carriage.

3. In an adding and recording machine, adding-wheels and printing means and mechanism to actuate the same, and a movable carriage for the paper printed on, in combination with mechanism adding and printing mechanism and said carriage-operating mechanism, and keys for throwing said means into action.

top of the supplemental pocket beneath which said supplemental pocket opens, substantially as shown and described.

the sections for moving the latter to closed position, a movable latch adapted for connecting the head and cross-piece, a track or way, a

3. In an adding and recording machine, adding-wheels and printing means and mechanism to actuate the same, and a movable carriage for the paper printed on, in combination with mechanism adapted to automatically actuate said carriage in reverse directions, and separate sets of key-levers for throwing said adding and printing mechanism and said carriage-actuating mechanism into action.



4. In an adding and recording machine, adding-wheels and printing mechanism and a movable carriage for the paper printed on, in combination with means to actuate said wheels and mechanism, mechanism adapted to automatically move said carriage in opposite directions, different sets of keys to throw said adding-wheels and printing mechanism and said carriage mechanism into action, and a power-driven shaft and clutch connections thereon operatively connected with said key-levers.

5. In an adding and recording machine, separately-mounted adding-wheels and mechanism for operating the same, a shaft and clutches thereon adapted to operate said mechanism, and a series of key-levers to throw said clutches into action, in combination with mechanism adapted to print from said wheels.

6. In an adding and recording machine, adding-wheels and actuating mechanism therefor comprising variable-throw members and cam and lever means for operating the same, a revolving shaft and key-controlled means for throwing said parts into action by means of said shaft.

7. In an adding and recording machine, adding-wheels and means to operate the same comprising rack and lever members for producing a variable throw, cams and friction-clutches to actuate said members, key-controlling means for said clutches, and a power-shaft for said clutches.

8. In an adding and recording machine, printing mechanism, a movable carriage to carry the paper for printing, automatic means for setting said carriage at predetermined places, power mechanism for throwing said means into action, and keys with which said power mechanism has mechanical connections.

9. An adding and recording machine provided with printing means, a movable carriage for the paper printed on, power means to automatically move said carriage in opposite directions, and keys for controlling the movement of said carriage in each direction.

10. In an adding and recording machine, printing and adding mechanism, and a movable carriage for the paper, in combination with a power-driven shaft, actuated means for setting said carriage at predetermined places and operating-keys for throwing said means into action, and operating-keys for said printing and adding mechanism.

11. In an adding and recording machine, adding and printing mechanism, a movable carriage for the paper and power-actuated means for setting said carriage at varying distances from the starting-point, in combination with a set of keys for controlling the setting of said carriage, and a set of keys for controlling said adding and printing mechanism.

12. In an adding and recording machine, adding and printing mechanism, a movable carriage for the paper, power-actuated means for setting said carriage at predetermined places, a set of key-levers for controlling said power-actuated means, power-driven mechanism for said adding and printing mechanism, and a set of keys for controlling the action of said power-driven mechanism.

13. In an adding and recording machine, adding and printing mechanism, a movable carriage and mechanism for operating the same, a power-shaft and means connected therewith to actuate said adding and printing mechanism and said carriage-operating mechanism, and keys for throwing said means into action.

14. In an adding and recording machine, adding-wheels and printing mechanism and a movable carriage for the paper, a train of actuating mechanism for said wheels, said printing mechanism and said carriage, a revolving shaft and friction-clutches thereon adapted to operate said train of mechanism, and a series of keys adapted to throw said clutches into action.

15. In an adding and recording machine, adding-wheels and printing mechanism and actuating means therefor comprising variable-throw members and cam and lever means for operating the same, a movable carriage for the paper and means for moving said carriage to predetermined distances, a revolving shaft, and key-controlled means for throwing said parts into action by means of said shaft.

16. In an adding and recording machine, adding-wheels and printing mechanism, rack and lever means for producing a variable movement of said wheels and printing mechanism, a carriage for the paper and means for producing a variable movement thereof, cams and friction-clutches to actuate said rack and lever means and said carriage-operating means, key-controlling means for said clutches, and power means for driving said clutches.

17. In an adding and recording machine, adding-wheels and printing mechanism, automatic means for operating said wheels and printing mechanism, and a series of keys adapted to throw said means into action, in combination with a movable carriage for the paper, automatic means for setting said carriage at predetermined places, and keys for throwing said means into action.

18. In an adding and recording machine, adding mechanism for the totals, and printing mechanism for the items, power means providing variable actuation of said mechanism, and a series of selector-keys for throwing said power means into action, in combination with a movable carriage for the paper, automatic means for setting said carriage at predetermined places, and a series of selector-keys for throwing said means into action.

19. In an adding and recording machine, adding mechanism and power means for automatically operating said mechanism, and keys to throw said power means into action, in combination with a movable carriage for the paper, means to automatically move said carriage in opposite directions, and selector-keys for determining the movement of said carriage.

20. In an adding and recording machine, adding-wheels and printing mechanism, means for operating said wheels and mechanism, and a series of selector-keys for said wheels and printing mechanism adapted to throw said means into action, in combination with a carriage for the paper, means to move said carriage, a series of selector-keys to control the movement of said carriage, and locking means for the adding-wheel and printing-mechanism keys having operative connections with said carriage.

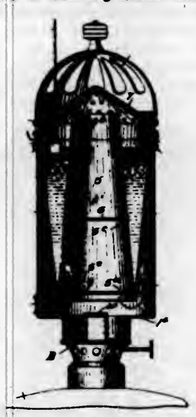
21. In an adding and recording machine, adding-wheels and a slidable item-printing type-bar and hammers for said wheels and bar, a variable-throw mechanism for actuating said wheels and said bar varying distances, a series of levers and clutch and cam members for said variable-throw mechanism, a power-shaft to operate said clutches, and selector-keys to throw said clutches into action.

22. In an adding and recording machine, adding-wheels and a slidable item type-bar and printing-hammers opposite thereto, a variable-throw mechanism for actuating said wheels and said bar, a series of levers and clutch and cam members for said mechanism, a power-shaft to operate said clutches and selector-keys to throw said clutches, in combination with a carriage for the paper, stops to limit the movement of said carriage, means to actuate said carriage, clutch and cam members to operate said stops and said carriage-actuating means, a driven shaft for said clutches, and selector-keys to throw said clutches into action.

813,362. **SAFETY-POCKET.** MARSHALL C. DEXTER, New York, N. Y., assignor to Hiram C. Dexter, New York, N. Y. Filed Mar. 31, 1905. Serial No. 253,179.

Claim.—A vest or other garment provided with a pocket, and a supplemental pocket secured therein, one side of the supplemental pocket at the opening thereinto being longer than the other, said longer side of the supplemental pocket being secured to one side of the main pocket at the opening thereinto and forming a fold at the top of the supplemental pocket beneath which said supplemental pocket opens, substantially as shown and described.

813,363. **FORMALDEHYDE-GENERATOR.** ALBERT H. DEXTER, Washington, D. C. Filed Aug. 8, 1904. Serial No. 220,001.



Claim.—1. A generator of the character stated, comprising a casing, a formaldehyde-chamber within said casing, a water-holding member surrounding said formaldehyde-generating chamber and contained within said casing, an air-chamber surrounding said water-containing member and connected by said casing, said air-chamber being in communication with the atmosphere, said water and air within the generator adapted to be heated by the heat evolved in the generating-chamber substantially as shown and described.

2. A formaldehyde-generator of the character stated comprising a body forming a formaldehyde-generating chamber, and a water-jacket surrounding said formaldehyde-generating chamber, a casing surrounding said water-jacket and air-chamber, the water in the water-chamber adapted to vaporize from the heat evolved in the generating-chamber.

3. A formaldehyde-generator of the character stated comprising a body forming a formaldehyde-generating chamber, and a water-jacket surrounding said formaldehyde-generating chamber, a casing surrounding said water-jacket and air-chamber, the water in the water-chamber adapted to vaporize from the heat evolved in the generating-chamber, and means for mixing said gas and vapor.

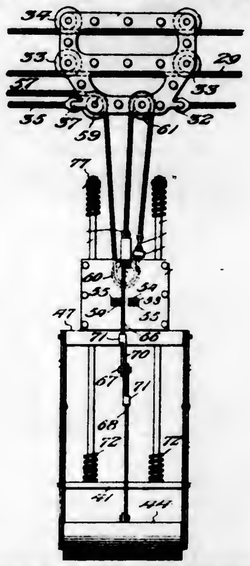
4. A means for generating formaldehyde-gas and water-vapor comprising a casing, supportable over an alcohol-burner, said casing having air-inlets and gas-outlets, a water-holder and a chimney suspended within said casing, said chimney forming a gas-generating chamber, and oxidizing-disks held within the chimney, all being arranged substantially as shown and described.

5. A formaldehyde-generator comprising an outer cylindrical casing having air-inlet apertures, a disk-carrying member and a water-containing member suspended within said outer casing, oxidizing-disks held within said disk-carrying member, an alcohol-containing means connected to the bottom of the casing, and a top for said casing, all being arranged substantially as shown and described.

813,364. **HOISTING AND CONVEYING MECHANISM.** CHRISTOPHER C. DOLAN, Lockport, N. Y. Filed June 9, 1905. Serial No. 264,497.

Claim.—1. In a device of the class described, a load-receiving device comprising a pair of relatively movable sections, a guide, a member slidably mounted upon the guide and operatively connected with the sections, a head slidably engaged with the guide, a movable latching member for connecting the head with the slidable member, a track or way, a carriage movable thereon and a hoisting-cable operatively connecting the load-receiving device with the carriage, said cable being adapted for actuating the latch to release the slidable member from the head.

2. In a device of the class described, a load-receiving device including a pair of relatively movable sections, a guide, a cross-piece slidably engaged therewith and operatively connected with the sections, a head slidable on the guide, and operatively connected with the sections for moving the latter to closed position, a movable latch adapted for connecting the head and cross-piece, a track or way, a carriage movable thereon, and a flexible hoisting element or cable operatively connecting the load-receiving device with the carriage, said cable being adapted for actuating the latch to release the cross-piece and permit movement of the sections to open position.



3. In a device of the class described, a load-receiving device including a pair of relatively movable sections, a guide, a member slidably engaged with the guide, and operatively connected with the sections for moving the latter to open position, a head slidably engaged with the guide and operatively connected with the sections for moving the same to closed position, a movable latch member connecting the head and slidable member, and a flexible hoisting element operatively engaged with the load-receiving device and adapted for actuating the latch to release said slidable member.

4. In a device of the class described, a load-receiving device including a pair of relatively movable sections, a guide, a member slidably engaged with the guide and operatively connected with the sections for moving the same to open position, a head slidably engaged with the guide and operatively connected with the sections for moving the same to closed position, a movable latching member adapted for connecting the slidable member and head, a flexible hoisting element operatively engaged with the load-receiving device, and a tripping member carried by said element and adapted to contact with and move the latch to releasing position.

5. In a device of the class described, a head, a load-receiving device operatively connected therewith and movable to dumping position, a guide-pulley journaled in the head, a movable latching member carried by the head a flexible operating element arranged to travel on the guide-pulley and provided with a latch-operating member, an element connected with the load-receiving device and adapted for engagement by the latching member to hold the device in non-dumping position, said latch being operable by the latch-operating member for releasing the element and springs acting on the latch to maintain the same normally in engaging position.

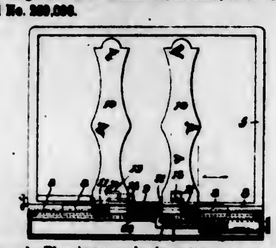
813,365. **CASK OR VESSEL FOR IGNITIBLE OR EXPLOSIVE LIQUIDS OR GASES.** WILHELM DEXTER, Bad Rothenfelde, Germany. Filed Aug. 10, 1905. Serial No. 273,879.

Claim.—1. A device of the class described, including a plurality of annular sections having central openings, space members interposed between said sections to form openings therebetween, a bushing having an opening corresponding to the central openings of the annular sections, and means for securing the said bushing and annular sections together.

2. In a receptacle, a bushing having an opening therethrough,

a plurality of rings having central openings corresponding to the opening in the bushing, a series of rings interposed between the first-mentioned rings for separating the same a distance from one another, and means passing through the several rings and engaging the closing device for connecting said rings to said bushing.

813,366. CIGARETTE-HOLDER. WALLACE DURAND, Newark, N. J., assignor to Durand and Co., Newark, N. J. Filed May 6, 1905. Serial No. 259,696.



Claim.—1. The improved cigarette-case, comprising hinged sections having an interior chamber for the reception of the cigarettes, a cigarette-holding arm adapted to extend across said cigarettes and hold the same in place in said chamber, a catch for holding said arm in cigarette-holding relation and having a finger-piece at the outside of the case, springs for throwing said arm away from said cigarettes when said arm is released from said catch.

2. The improved cigarette-case, comprising chambered sections adapted each to contain a series of cigarettes, a hinge-pin joining said sections, holding-arms arranged on said hinge-pin and adapted to extend across the cigarettes to hold the same in place in said sections, catches for holding said arms across the cigarettes, said catches extending from said arms to the outside of the case where said catches may be manipulated by the fingers, and springs for throwing the arms from said cigarettes when said arms are released from said catches.

3. The improved case comprising sections, a hinge-pin joining said sections, spring-actuated holding-arms arranged on the hinge-pin of said sections, a spring for throwing said sections open, other springs independent of the case-opening spring but arranged on the same said hinge-pin therewith, for throwing the arms when released away from the contents of the case, and catches adapted to fasten the arms against the said contents to be held on closing the sections together.

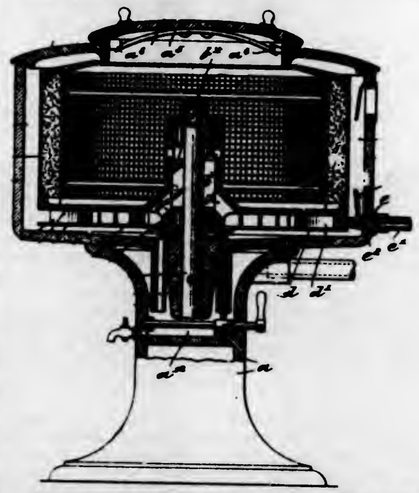
4. The improved cigarette-case, comprising hinged sections, cigarette-holding arms, springs arranged and adapted to throw the said holding-arms away from the cigarettes upon said arms being released and catches adapted to fasten the arms against the cigarettes on closing the hinged sections together, substantially as set forth.

5. The improved cigarette-case, comprising sections, a hinge-pin joining said sections, cigarette-holding arms within said case, springs on said hinge-pin tending to throw said arms away from the cigarettes upon being released from the catches, catches adapted to fasten the arms against the cigarettes in closing the hinged sections together and said catches having finger-pieces outside said sections and movable in a direction parallel with the hinge-pin, said catches being released from said arms by pressure on the finger-pieces, and springs for said catches.

6. The improved cigarette-case, comprising hinged sections each on the one hinge-pin and adapted to receive or contain a series of cigarettes, arms hinged on the same hinge-pin with said sections, a spring arranged on said hinge-pin and tending to throw said sections open when the same are released, other springs arranged on the same hinge-pin and bearing on the said arms one to throw one arm away from cigarette-holding relation to one section when said arm is released and the other away from cigarette-holding relation with the other section when released, and means adapted to hold said arms in cigarette-holding relation after the sections are spread.

7. The improved cigarette-case, comprising hinged sections each on the one hinge-pin and adapted to receive or contain a series of cigarettes, arms hinged on the same hinge-pin with said sections, a spring arranged on said hinge-pin and tending to throw said sections open when the same are released, other springs arranged on the same hinge-pin and bearing on the said arms one to throw one arm away from cigarette-holding relation to one section when said arm is released and the other away from cigarette-holding relation with the other sections and catches for holding said arms closed toward the cigarettes, comprising tubular cases secured to the case-sections parallel to the hinge-pin and containing a spring, and a sliding rod, hook-shaped at its inner end to engage a coöperating catch on the arm and at its outer end having a finger-piece.

813,367. LUBRICATING DEVICE FOR CENTRIFUGAL OIL-EXTRACTING MACHINES. EDWARD H. DUTCHER, Siegfried, Pa., assignor, by direct and mesne assignments, to Lehigh Oil and Waste Saving Company, Camden, N. J. Original application filed July 3, 1905, Serial No. 268,105. Divided and this application filed Oct. 7, 1905. Serial No. 281,742.

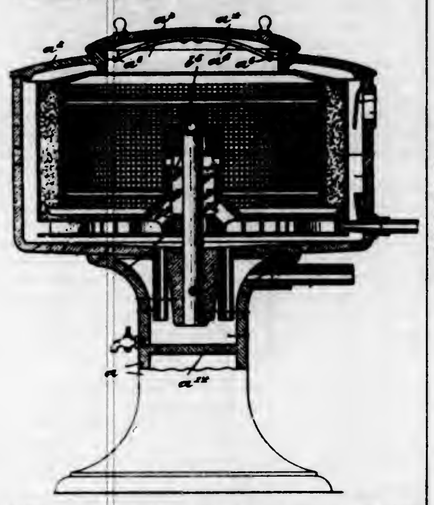


Claim.—1. In a lubricating device for oil extracting and filtering machines, a housing having a basket for oil-containing material adapted to extract oil and force the same against said housing, a shaft terminating in said basket, bearings interposed between said shaft and basket and adapted in conjunction with said shaft, to support said basket, means adapted to conduct steam into the housing to rotate said basket and means adapted to collect a portion of the extracted oil and conduct the same into the steam-inlet means to utilize the steam in conducting oil to said bearings.

2. In a lubricating device for oil extracting and filtering machines, a housing having a basket for oil-containing material provided with an extension, said basket adapted to extract oil and force the same against said housing, a disk having blades secured to said basket, a nozzle carried by said housing and adapted to introduce and direct against said blades a jet, as of steam, to rotate said basket to extract the oil therefrom, by centrifugal force, and to force the same against the interior wall of said housing, means connected with said nozzle and adapted to collect and conduct a portion of the oil in said nozzle into the steam passing therethrough so as to utilize the same in conducting the oil in the extension of said basket to lubricate the bearings therein.

3. In a lubricating device for oil extracting and filtering machines, a stationary housing having a shaft, a basket for oil-containing material having a central extension forming a chamber, bearings interposed between said shaft and extension and adapted to support said basket, a disk having blades secured to said basket, a nozzle carried by said housing and adapted to introduce and direct against said blades a jet, as of steam, to rotate said basket to extract oil therefrom, by centrifugal force, and conduct onto the interior wall of said housing, a receptacle connected with said nozzle and housing adapted to collect and conduct a portion of the oil to said nozzle into the steam passing therethrough to lubricate the bearings in the extension of said basket and force the same by conducting oil introduced into said nozzle to the same.

813,368. CENTRIFUGAL FILTER. EDWARD H. DUTCHER, Siegfried, Pa., assignor, by direct and mesne assignments, to Lehigh Oil and Waste Saving Company, Camden, N. J. Original application filed July 3, 1905, Serial No. 268,105. Divided and this application filed Oct. 7, 1905. Serial No. 281,742.



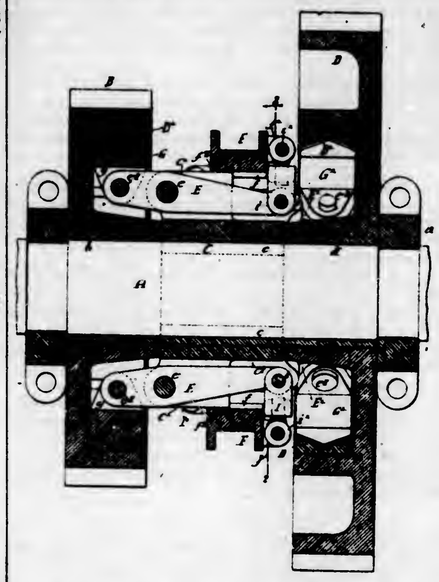
Claim.—1. A separator for centrifugal oil extracting and filtering machines, consisting of a standard having a settling-chamber, a housing carried by said standard having a bottom downwardly inclined toward its central portion, means arranged in said bottom for connecting the housing with said settling-chamber, a basket for oil-containing material having outer and inner perforated walls for permitting of the passage of oil and water therethrough into said housing and of the conducting of the oil and water by its bottom and the connecting means carried by the same into said settling-chamber, and outlets arranged at different planes in said standard for permitting the separate removal of oil and water therefrom.

2. A separator for centrifugal oil extracting and filtering machines, consisting of a standard having a settling-chamber, a housing carried by said standard having an inclined bottom, tubes arranged in said bottom extending into said settling-chamber and adapted to connect the housing with said chamber, a basket for oil-containing material having walls adapted to permit of the passage of oil and water therethrough and rotatably arranged in said housing, said housing adapted to collect oil and water from said basket and by the inclined bottom thereof to conduct the same into said tubes, an outlet for oil and an outlet for water in said standard arranged above and below the free ends of said tubes, to permit of separate removal of the oil and water from said settling-chamber.

3. A separator for centrifugal oil extracting and filtering machines, consisting of a standard having a settling-chamber, a housing carried by said standard having an inclined bottom, tubes arranged in said bottom and extending into said settling-chamber and adapted to connect said housing therewith, a basket for oil-containing material having walls to permit of the passage of oil and water therethrough and rotatably mounted in said housing, said housing adapted to collect oil and water from said basket and by the inclined bottom thereof to conduct the same into said tubes, a drain-pipe for oil and a drain-cock for water arranged above and below the free ends of said tubes, respectively, and adapted to permit of the separate removal of the oil and of the water from said settling-chamber and tubes to permit of the discharge of the oil and water at a point normally below the level of the oil, in said chamber.

813,369. CLUTCH. ARCHIBALD H. BELL and JAMES H. BELL, Philadelphia, Pa., assignors to Burnham, Williams & Company, Philadelphia, Pa., a Firm. Filed July 22, 1905. Serial No. 270,269.

Claim.—1. The combination in a clutch, of a hub, levers pivoted thereto, shoes carried by the levers, a ring with which the shoes engage, and a shifting ring connected to the levers, the said levers passing through said shifting ring, substantially as described.



2. The combination of a shaft, a ring on said shaft, a hub also on the shaft, levers pivoted to the hub, shoes carried by the short arms of the levers and arranged to bear upon said ring, a shifting ring mounted on the hub, the levers passing through the shifting ring, and a link connecting the long arm of each lever to the said shifting ring, substantially as described.

3. The combination of a shaft, a hub thereon, two wheels mounted on the shaft, each wheel having an internal friction-surface, two sets of levers pivoted to the hub, a shoe attached to the short arm of each lever arranged to bear upon the friction-surface of the respective wheels, a shifting ring mounted on the hub, the long arm of each lever passing through the shifting ring, and links attaching the ends of each long arm to the shifting ring, substantially as described.

4. The combination of a shaft, two loose wheels mounted on the shaft, a hub fixed to the shaft and mounted between the two wheels, two sets of levers pivoted to the said hub, a shoe carried by the short arm of each lever, a shifting ring common to all the levers and connected to the long arm of each lever, one set of shoes engaging with one of the wheels, the other set of shoes engaging with the other wheel, the said levers being so arranged that they pass through the shifting ring, substantially as described.

5. The combination of a shaft, two gear-wheels mounted on the shaft, a hub secured to the shaft and mounted between the two wheels, collars on the shaft holding said wheels in position, each wheel having a V-shaped friction-surface, two sets of levers, one set being pivoted to one end of the hub, the other set being pivoted to the other end of the hub and alternating with the first set, a shifting ring arranged to slide on the hub and over the levers, a link connecting the long arm of each lever to the ring, and a shoe carried by the other arm of each lever and arranged to engage the frictional surfaces of the wheels, substantially as described.

6. The combination of a shaft, two wheels loose on the shaft, a hub mounted between the wheels and secured to the shaft, an annular friction-ring secured to each wheel and having a V-shaped friction-surface, two sets of levers, one set of levers being pivoted to one end of the hub, the other set of levers being pivoted to the other end of the hub and alternating with the first set of levers, a shifting ring arranged to slide on the hub, adjustable links connecting the shifting ring to the long arms of each lever, and a segmental shoe pivoted to the short arm of each lever and having a V-shaped surface corresponding to the friction-surface of the friction-rings, substantially as described.

813,370. WIRE FENCE. BRADEN L. BLEWELL and WILLIAM GREEN, Morton, Ill., assignors to Interlocking Fence Company, Morton, Ill., a Corporation of Illinois. Filed Apr. 4, 1904. Serial No. 201,264.

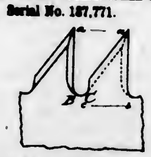
813,870. WIRE FENCE. BRADEN L. BLAWELL and WILLIAM GRIER, Morton, Ill., assignors to Interlocking Fence Company, Morton, Ill., a Corporation of Illinois. Filed Apr. 4, 1904. Serial No. 201,266.

Claim.—1. In a fence, the combination of a series of longitudinal wires, stay-wires having looped portions disposed at the intersection of the longitudinal wires, and the loops of the stays intertwisted with the longitudinal wires by a right and left intertwist, substantially as specified.

2. In a fence, the combination of a cable selvage-strands intertwisted from a series of wire strands and intermediate body-wires of a single strand, stay-wires having radially-extended looped portions disposed at the intersection of the selvage and body wires, said looped portions of the stays intertwisted with the selvage and body wires by a right and left intertwist, substantially as specified.

3. In a fence, the combination of a longitudinal wire, a stay-wire having a returned loop portion coinciding with the longitudinal wire and with portions of the stay extending at right angles and in opposite directions to the longitudinal wire, the loop portion of the stay intertwisted with the longitudinal wire in reverse directions from a point 6 in the said loop, and having the eye portion 7, substantially as shown and specified.

813,871. SAW-TOOTH. CHRISTOPHER C. FLEMING, Dallas, Tex. Filed Jan. 5, 1904. Serial No. 187,771.



Claim.—In a saw, teeth uniform and in unbroken series, being in length equal to the length of the base, or equal to one and one-half times the length of the base, beveled forty-five to sixty degrees, the front cutting edge of the teeth being approximately straight, or at about right angle with the saw-blade, substantially as described and shown.

813,872. THREAD-WINDING MACHINE. GEORGE W. FOSTER, Pawtucket, R. I. Filed Mar. 11, 1905. Serial No. 249,606.

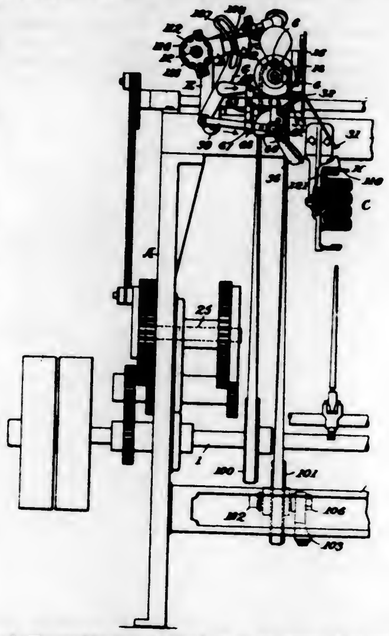
Claim.—1. In a winding-machine having two sets of driving-rolls with shafts provided with pulleys, and an endless belt passing over both pulleys, the combination with the said parts, of a shaft 1 having a pulley receiving one loop of the belt, a bracket supporting an adjustable stud, and a pulley turning upon said stud and receiving the other loop of the belt, substantially as set forth.

2. The combination in a winding-machine, with the two roll-shafts, pulleys and endless looped belt, of a driving-shaft supporting a pulley beneath which one loop of said belt passes, a second pulley beneath which another loop of the belt passes, and a bracket bolted to the frame of the machine and provided with an adjustable stud upon which the second pulley turns, substantially as set forth.

3. The combination with the driving-roll of a winder, of a swinging frame, a spindle carried thereby, a pivoted arm having a curved slot arranged to receive a projection of the frame, a stop device connected with the arm to shift the fulcrum of the latter and to bite the said projection in said slot and lift the frame when the stop device is moved on the breaking of a thread, substantially as set forth.

4. The combination with the swinging frame and spindle of a winding device, of a pivoted arm, a stop-motion device, means for swinging the arm from said stop-motion device to shift the fulcrum thereof when the thread breaks, and engaging means between the arm and frame arranged to permit the independent movement of the frame when the thread is unbroken, but to engage the two parts when the arm is swung on the breaking of a thread, substantially as set forth.

5. The combination with the frame D, its actuating-arm, block 40, and bar 39, of a stud 110 upon the block, substantially as and for the purpose set forth.



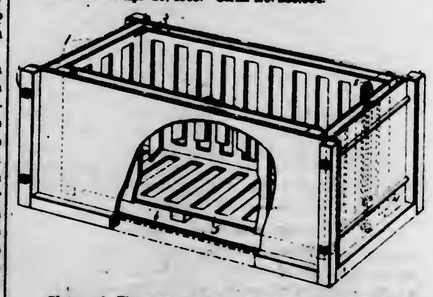
6. The combination with the frame D and support E, of coinciding inclined faces on the frame and support arranged to insure a longitudinal movement of the frame as it moves upward, substantially as described.

7. The combination with the frame D, support E and inclined faces upon the frame bearing upon part of said support to insure a longitudinal movement of the frame as it swings upward, of a spring bearing upon the frame and arranged to secure a reduced frictional resistance as the frame swings upward, substantially as set forth.

8. The combination with the drive-roll and cop-spindle of a winding-machine, of a pivoted frame carrying said spindle, and means for moving said frame longitudinally to lay each layer of thread in advance, toward one end of the cop, of the preceding layer, substantially as set forth.

9. The combination with the spindle of a winding-machine, of means for laying the thread thereon in crossed helices extending the length of the cop in each layer, and means for shifting said spindle to lay each layer of thread farther toward one end of the cop than the preceding layer, substantially as set forth.

813,873. PROCESS FOR EXTRACTING ALBUMIN FROM VEGETABLE SUBSTANCES. FREDERICK W. GAMPERER, Niagara Falls, N. Y. Filed Apr. 20, 1903. Serial No. 153,004.



Claim.—1. The process of obtaining purified albumin from vegetable substances, which consists in mixing the vegetable substance in a finely-subdivided condition in a warm saline solution and maintaining the substance in the solution for several hours, filtering the mixture, boiling the filtrate to coagulate the albumin, filtering out and drying the albumin, then depositing the albumin in a subdivided form in a cool bath of water, containing sodium peroxid and a suitable acid, for from one hour to twelve hours, then removing and drying the albumin.

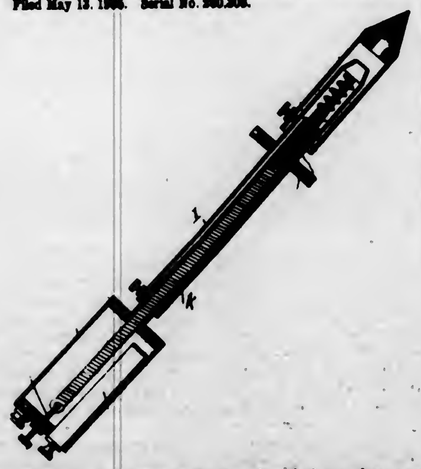
2. The process of extracting albumin from vegetable substances, which consists in reducing the vegetable substance substantially to the form of meal, mixing the same in a warm saline solution in the proportion of from seven to ten parts of the solution to one of the meal, said solution containing salt in the proportion of about five per cent. to about twelve per cent. of the amount of water in excess of about five parts of water, maintaining the mixture for several hours at a temperature of from about 30° centigrade to about 40° centigrade to dissolve out the albumin, then filtering the mixture, boiling the filtrate to coagulate the albumin, then filtering out and drying the albumin.

3. The process of extracting albumin from vegetable substances, which consists in reducing the vegetable substance to about the form of meal, mixing the meal in a warm saline solution in the proportion of about one part of meal to about ten parts of water, said solution containing salt in the proportion of about seven per cent. to the amount of water above five parts of water, maintaining the mixture at a temperature of from 30° centigrade to 40° centigrade for five hours more or less, to extract the albumin, then filtering the mixture and boiling the filtrate to coagulate the albumin, then filtering out the coagulated albumin, then drying and breaking up the albumin into suitable sizes.

4. In a process for extracting albumin from a vegetable substance, the method of purifying the albumin, which consists, in reducing the albumin to a suitable size and then depositing it in a cool bath containing peroxid of sodium and sulfuric acid, maintaining the albumin in the bath for from one to twelve hours, removing the albumin from the bath, then drying and grinding the albumin.

5. In a process for extracting albumin from vegetable substances the method of purifying and bleaching the albumin, which consists in preparing in a wooden tank a cool solution containing from one to twelve pounds of peroxid of sodium to one hundred gallons of water, sulfuric acid in the proportion of about one and one-third to one part of peroxid of sodium and a small quantity of an alkali, by first mixing the sulfuric acid with the water, adding the peroxid of sodium in small quantities and stirring it in, adding the alkali in very small quantities and stirring it in, then suspending the albumin in a subdivided form in a filter-cloth in the solution for from one to twelve hours, thoroughly mixing the albumin with the solution, then removing, rinsing and drying the albumin and then grinding it to a fine powder.

813,874. SOLDERING-IRON. PEARL GILBERT, Newport, R. I. Filed May 13, 1905. Serial No. 260,208.



Claim.—1. In a device of the class described, a tank or reservoir, a soldering-head, a jet-nozzle within the latter, a feed-duct connecting the tank and nozzle, and a spirally-coiled feed member within the feed-duct.

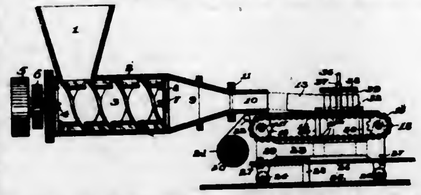
2. In a device of the class described, a tank or reservoir, a jet-nozzle provided with feed and jet passages, a soldering-head disposed and sustained in the path of the jet-passage, a feed-duct connecting the tank and jet-nozzle, and a tubular spirally-coiled feed member within the feed-duct and communicating with the feed-passage.

3. In a device of the class described, a tank or reservoir, a jet-nozzle having a feed-passage, a feed-duct connecting the tank and nozzle, a spirally-coiled tubular feed member housed in the duct and communicating with the feed-passage, said nozzle being provided with a jet-opening, and a soldering-head sustained in the path of said opening.

4. In a device of the class described, a tank or reservoir, a jet-nozzle having feed and jet openings, a feed-duct connecting the tank with the nozzle and provided at the rear end of the latter with a chamber, a spirally-coiled tubular feed member housed in the duct and adapted to feed liquid fuel thereover, said member being arranged for communication at one end with the feed-passage and at its other end with the chamber and having return-coils leading from the latter, and a soldering-head sustained in the path of the jet-opening.

5. In a device of the class described, a tank or reservoir, a jet-nozzle having feed and jet openings, a duct connecting the tank with the nozzle and provided in rear of the latter with a chamber, a spirally-coiled tubular feed member arranged in the duct and having one end connected with the feed-passage and its other end communicating with the chamber, said member being adapted to feed liquid fuel through the duct to the chamber and thence through itself to the feed-passage, a vaporizing-tube connected with said passage and leading to the jet-opening, and a soldering-head sustained in the path of the latter.

813,875. ICE-CREAM MACHINE. JOHN J. GLAUBER, Pittsburg, Pa., assignor to The Edward H. Rieck Company, Pittsburg, Pa., a Corporation of Pennsylvania. Filed Feb. 25, 1905. Serial No. 247,218.



Claim.—1. In slicing mechanism, a table, an endless conveyer mounted on said table, a shearing member mounted on said table and adapted to be swung transversely thereto, means for advancing said shearing member in the line of movement of said conveyer, spring-actuated means for returning said shearing member to its normal position and an electric circuit in which said shearing member is a part, substantially as and for the purposes set forth.

2. In slicing mechanism, an endless conveyer, means for discharging the material to be sliced upon said conveyer, a frame adapted to be swung transversely to said conveyer, combined means for slicing and smoothing the sliced surface of said material said means being mounted in said frame and means for heating said slicing and smoothing means, substantially as described.

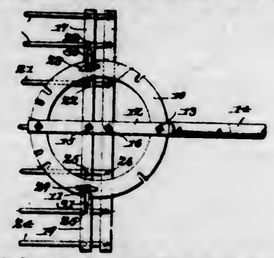
813,876. LATCH. JASPER L. GREENWOOD, Hoboken, N. J. Filed Mar. 27, 1905. Serial No. 252,315.

Claim.—1. A device of the kind described, comprising a face-plate having a casing secured thereto, each of which has slots arranged therein, a latch-bolt carried by a face-plate and casing and operating through the slots, said bolt projecting at right angle to the

longitudinal axis of the casing and having shoulders engaging the face-plate and casing, and a spring arranged within the casing and adapted for engagement with the bolt all substantially as shown and described.

3. A latch of the kind described, comprising a face-plate, a casing arranged at one end thereof, said face-plate and casing having oppositely-disposed slots, a latch-bolt projecting through the slots, said bolt having shoulders that engage the face-plate and casing, and also having a beveled nose at one end and a knob at its opposite end and a coiled spring arranged within the casing and adapted to normally force the bolt toward one end of the slots, substantially as specified.

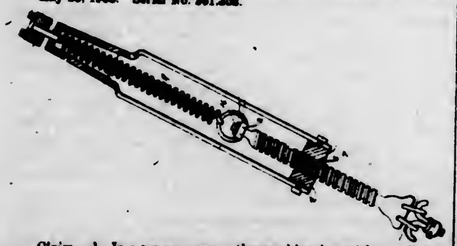
813,377. **GARDEN RAKE AND CULTIVATOR.** BENJAMIN J. H. GUNN, Grapeland, Tex. Filed Apr. 10, 1905. Serial No. 254,838.



Claim.—1. In an implement of the class described, an annular supporting-frame, a draft-bar connected transversely of said frame, tooth-bars arranged in pairs and extending at the inner ends beneath said draft-bar, a central rake-tooth extending beneath the inner ends of said tooth-bars, pivot-bolts extending through said draft-bar the tooth-bars and the central tooth and movably coupling the same, rake-teeth spaced apart and pivoted to said tooth-bars, and means for adjustably coupling said tooth-bars to said annular frame.

2. In an implement of the class described, an annular supporting-frame having spaced marginal recesses, a draft-bar connected transversely of said frame, tooth-bars arranged in pairs and extending at the inner ends beneath said draft-bar and provided with longitudinal slots, pivot-bolts extending through said draft-bar and tooth-bars and movably coupling the same, rake-teeth spaced apart and pivoted to said tooth-bars, and clamp-bolts disposed in said longitudinal slots and adapted for detachable engagement with said marginal recesses.

813,378. **TEMPER-SCREW.** BARRET C. HAGAN, West Monterey, Pa., assignor of one-half to C. M. Hagan, West Monterey, Pa. Filed May 30, 1905. Serial No. 261,268.



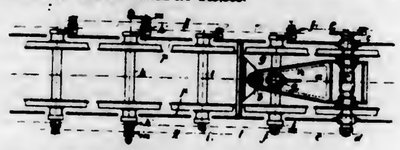
Claim.—1. In a temper-screw, the combination with a walking-beam, of a head carried by said walking-beam, depending reins carried by said head, blocks detachably connected to the lower ends of said reins, a screw operating through said blocks, a suspension-spring mounted in said head and swivelly connected to the upper end of said screw, substantially as described.

2. In a temper-screw, the combination with a walking-beam, of a head connected to said walking-beam, depending reins carried by said head, a screw operating between said reins, a spring mounted in said head and swivelly connected to said screw, substantially as described.

3. In a temper-screw, the combination with a hollow head, having depending spring-reins, screw-threaded blocks detachably connected to the lower ends of said reins, a screw arranged between said blocks, a collar carried by said screw, an annular head surrounding the screw below said collar, antifriction-balls arranged between said annular head and said collar, a ring attached to said annular head and a suspension-spring connected to said ring and to said hollow head, substantially as described.

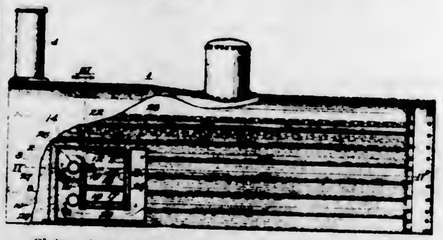
4. In a temper-screw, the combination with a hollow head having depending reins, of a screw operating between said reins, a spring mounted between said reins and extending into the said head and connected to said screw, substantially as described.

813,379. **LOCOMOTIVE.** CHRISTIAN HAGANS, Erfurt, Germany. Filed Jan. 30, 1905. Serial No. 243,363.



Claim.—Means for laterally adjusting a driving or driven locomotive-axle, comprising the combination with said axle, of a laterally-adjustable hollow end axle, a core-axle for said hollow axle, and means for transferring the movement of said hollow end axle to the driving or driven locomotive-axle and for driving the said core-axle.

813,380. **STEAM-BOILER FURNACE.** WELLESLEY R. HAMPDEN, Kansas City, Mo., assignor, by direct and mesne assignments, to The Fuel Saver Heating Company, a Corporation of Missouri. Filed July 22, 1905. Serial No. 270,765.

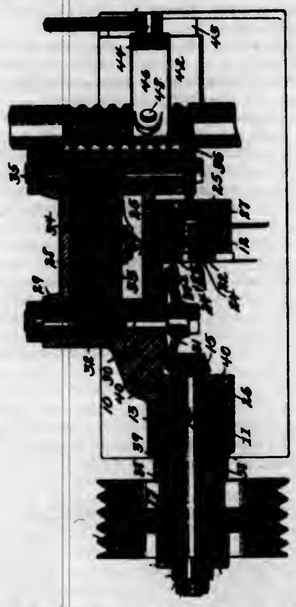


Claim.—1. A boiler-furnace, comprising a shell or body, partitions therein forming a water-chamber, a smoke-box and a smoke-chamber, at opposite sides of the water-chamber and provided with an exit for the smoke-chamber, flues extending through the water-chamber and connecting the smoke-box and smoke-chamber, a furnace within the water-chamber and enveloped on all sides by the water therein and formed with a fire-pot and with a substantially U-shaped chamber opening into the upper end of the fire-pot and enveloping the front, rear and lower sides of the same but spaced from said sides to provide an interposed water-space, flues connecting the front portion of said enveloping-chamber with the smoke-chamber, and one or more air-supply tubes extending through the rear portion of said enveloping-chamber and communicating with the atmosphere and provided with air-jet orifices opening into said enveloping-chamber.

2. A boiler-furnace, comprising a shell or body having a side opening, partitions therein forming a water-chamber, a smoke-box and a smoke-chamber, at opposite sides of the water-chamber and provided with an exit for the smoke-chamber, flues extending through the water-chamber and connecting the smoke-box and smoke-chamber, a furnace within the water-chamber and enveloped on all sides by the water therein and a side opening communicating therewith, said furnace being formed with a fire-pot and with a substantially U-shaped chamber opening into the upper end of the fire-pot and enveloping the front, rear and lower sides of the same but spaced from said sides to provide an interposed water-space, flues connecting the front portion of said enveloping-chamber with the smoke-chamber, one or more air-supply tubes extending through the rear portion of said enveloping-chamber and communicating with the atmosphere and provided with air-jet orifices opening into said enveloping-chamber, a tube connecting the side opening of the shell and fire-pot, and a door controlling said openings.

3. In a boiler-furnace, a shell or body having a water-chamber, a furnace within and enveloped on all sides by the water in said chamber, and formed with a fire-pot and with a substantially U-shaped chamber opening into the upper end of the fire-pot and enveloping the front, rear and lower sides of the same but spaced from said sides to provide an interposed water-space, and one or more air-supply tubes extending through the rear portion of said enveloping-chamber and communicating with the atmosphere and provided with air-jet orifices opening into said enveloping-chamber.

813,381. **ADJUSTABLE SUPPORT FOR METAL-WORKING TOOLS.** HENRY M. W. HANSEN, Hartford, Conn., assignor to Pratt & Whitney Company, Hartford, Conn., a Corporation of New Jersey. Original application filed July 13, 1903, Serial No. 165,327. Divided and this application filed Nov. 29, 1905. Serial No. 289,189.



Claim.—1. The combination, with a slide having bearings, of an adjustable cutter-frame having trunnions journaled in said bearings; means for fixing the frame in position after adjustment; a pair of shafts journaled in the cutter-frame; a gear secured to each of said shafts; a gear journaled in the cutter-frame intermediate to, and in mesh with, the shaft-gears; a shaft passing through one of the trunnions and carrying a gear for driving one of the pair of shafts; and a milling-cutter secured to one of said shafts, the axis of said milling-cutter intersecting the axis of the cutter-frame, and the point of intersection being in the same horizontal plane as the work-spindle.

2. The combination, with a slide having standards, of an adjustable cutter-frame; trunnions carried by said frame and journaled in bearings of said standards, one of said trunnions being externally threaded and the other provided with a threaded bore; a nut upon the externally-threaded trunnion, and serving to draw the same within its bearing; a screw engaging the threaded bore of the other trunnion, and having a head bearing against one of the standards; a rotary cutter carried by the cutter-frame; and means for actuating said cutter.

3. In a machine of the class specified, the combination, with a tool-carriage having standards, of a cutter-frame located between said standards; trunnions fitted in bearings of the standards, one of said trunnions having a longitudinal bore; a shaft mounted in said bore; means for rotating said shaft; a gear secured to said shaft; a shaft journaled in the cutter-frame and having a pair of gears, one of which is in mesh with the gear on the shaft mounted in the bore of said trunnion; a second gear journaled in the frame and engaging the other of said pair of gears; a cutter-shaft having a gear in mesh with said second gear; and a milling-cutter secured to the cutter-shaft.

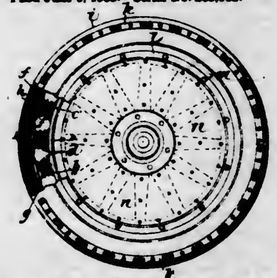
4. The combination, with a support, of a cutter-frame; trunnions projecting from said frame and entering bearings of the support, one of said trunnions having a hollow portion with an internal thread; screws for securing said internally-threaded trunnion to the support; and a screw engaging the thread of said trunnion and having a head bearing against the support.

5. The combination, with a support, having standards provided with bearings, of a chambered frame having fixed trunnions mounted in said bearings, one of said trunnions being tubular; means applied to each trunnion for securing the frame against movement; a driven shaft passing through the tubular trunnion; a bevel-pinion on the end of said driven shaft; a shaft journaled in the frame; a bevel-gear in engagement with said bevel-pinion, and carried by said shaft; gearing mounted in a chamber of the frame; a cutter-spindle driven by said gearing; and a milling-cutter secured to said cutter-spindle.

6. In a machine of the class specified, the combination, with a support having standards provided with bearings, of a frame having fixed trunnions mounted in said bearings; a nut threaded on one of said trunnions at the outer side of one of the bearings; a screw tapped into the other trunnion and having a head bearing against the inner side of the standard in the bearing of which said trunnion is mounted; a tool-spindle journaled in the frame; and means for driving said tool-spindle.

7. In a machine of the class specified, the combination, with means for supporting and rotating work, of a reciprocatory carriage; a slide transversely adjustable on said carriage, and having standards provided with bearings; a frame having fixed trunnions journaled in said bearings, one of said trunnions being tubular; means for securing the frame against the standards; a shaft journaled in the tubular trunnion; a bevel-pinion secured to said shaft; a shaft journaled in the frame; a bevel-gear on said shaft; a spur-pinion also on said shaft; a spur-wheel; a cutter-spindle carrying a spur-pinion in engagement with said spur-wheel; and a milling-cutter carried by the cutter-spindle.

813,382. **VEHICLE-WHEEL RIM.** ISAAC HODGSON, Minneapolis, Minn., assignor to The Automobile Wheel and Rim Company of New Jersey. Filed June 6, 1905. Serial No. 263,992.



Claim.—1. An elastic rim combining a plurality of channeled plates *f* flexibly united by cables *g*, the pad *h*, springs *d*, engaging said channeled plates *f*, and the base-plates *c*, the latter being secured to the band *b*, substantially as and for the purposes set forth.

2. An elastic rim combining a suitable cover *i*, secured to the rod-plates *f*, by the bolts *j*, its open edges being secured to the band *b*, by the annular clamps *l*, substantially as shown and described.

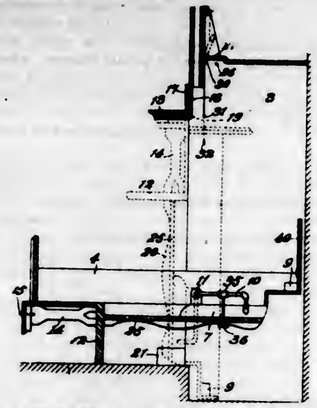
813,383. **COMBINED HEATER AND FOLDING FURNITURE.** WILLARD C. JAMES, Cassenega, Cal. Original application filed June 17, 1901, Serial No. 64,947. Divided and this application filed Feb. 14, 1903. Serial No. 143,462.

Claim.—1. A combined folding bed and heater comprising a fixed support, an inlet and an outlet pipe therein, a perforated bed-frame pivotally mounted in the support, a heater rigidly secured in the front of the frame, means at the rear of the frame for connecting the inlet with the heater, and means for connecting the perforation with the outlet.

2. A combined folding bed and heater comprising a support, an inlet and an outlet therein, a perforated bed-frame pivotally mounted in the support, a heater rigidly secured in the forward side of said frame, a pipe at the rear of the frame from the inlet to the heater provided with a valve, a handle from the valve to the front of the frame, and a conduit from the perforation to the outlet.

3. A combined folding bed and heater, comprising fixed supporting means, a bed-frame, pivotally supported in such means, and

a heater, rigidly secured to the bed-frame, said bed-frame being provided with a recess serving as a fireplace for the heater, and a fuel-supply conduit leading through the pivotal support of the bed-frame and communicating with the heater.



4. A combined folding bed and heater, comprising fixed supporting means, a bed-frame, trunnions whereby said bed-frame is pivotally supported in the fixed supporting means, one of said trunnions being provided with a conduit therethrough for fuel, and the other trunnion being provided with a conduit therethrough for waste gases, and a burner and fireplace on the bed-frame respectively connected to said conduits.

5. A combined folding bed and heater, comprising fixed supporting means, a bed-frame on the fixed supporting means, trunnions whereby said bed-frame is pivotally supported in the fixed supporting means, one of said trunnions being provided with a fuel-supply passage, and the other with a passage for waste products of combustion, a burner on the bed-frame connected to said passages, and fuel-supply and waste flue pipes in the fixed supporting means connected to the respective passages.

6. A combined folding bed and heater comprising a support, a bed-frame therein, hollow trunnions between the frame and the support, a heater in the forward side of the frame, a pipe from the heater to and projecting through one of the trunnions, the outer end of which is perforated, an inlet pivotally mounted on said end of the pipe and adapted to communicate with said perforation when the bed-frame is in its vertical or folded position, and a ventilator communicating with the heater and passing through the other trunnion.

7. A combined folding bed and heater comprising a fixed support, an inlet and an outlet pipe therein, a perforated bed-frame pivotally mounted in the support, a heater rigidly secured in the frame, means for connecting the inlet with the heater, and means for connecting the perforation with the outlet.

8. In an apartment construction, a bed-holding compartment, and a bed-frame pivotally supported at the front of the compartment, a heater rigidly secured to said bed, in front of and below the pivotal support thereof so as to swing back into the compartment as the bed-frame is lowered, and a fuel-supply conduit extending through the pivotal support of the bed and communicating with the heater.

813,884. **LIFTING DEVICE.** KARL KIEFER, Cincinnati, Ohio. Original application filed Nov. 21, 1904, Serial No. 233,647. Divided and this application filed Mar. 27, 1905. Serial No. 252,260.

Claim.—1. In a filter-layer-lifting device, the combination with a frame part, of a handle part, means to take hold of the frame part without changing the position of the hand on the handle part, and a plurality of lifting-hooks operated by the handle part.

2. In a filter-layer-lifting device, the combination with a frame part, of a handle part adapted to be taken hold of by means of a handle proper and to spread, when moving upward, a plurality of lifting-hooks.

3. In a filter-layer-lifting device, the combination with a frame part, of a plurality of lifting-hooks suspended normally vertically on pins around which they loosely swing and adapted to be spread by an upward movement of the part which is taken hold of when extracting the filter layer, and released by a reverse movement of the same part.

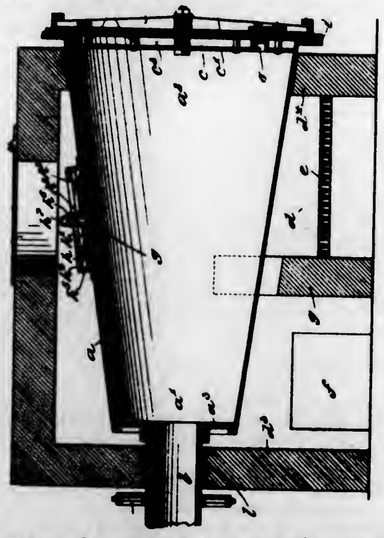
4. In a filter-layer-lifting device, the combination with a frame part having a projection to prevent overinsertion, of a plurality of lifting-hooks, a handle part for taking hold of and extracting the filter layers, and means attached to such handle part to spread and release said lifting-hooks.

5. In a filter-layer-lifting device, the combination with a frame part, of a plurality of lifting-hooks, a handle part for taking hold of and extracting the filter layer, and means attached to such handle part to spread and release said lifting-hooks.

6. In a filter-layer-lifting device, the combination with a handle part and a frame part, the handle part consisting of a vertical part centrally and longitudinally movable in the frame part, and also having a cross-bar to be taken hold of by the hand when extracting the filter layer, of means to take hold of the frame part situated immediately below said bar, and a plurality of lifting-hooks spread by the handle part when moving upward relatively to the frame part.

7. In a filter-layer-lifting device, the combination of a handle part and a frame part, the handle part consisting of a vertical part centrally and longitudinally movable in the frame part, and also having a cross-bar to be taken hold of by the hand when extracting the filter layer, means to take hold of the frame part in close vicinity of the cross-bar of the handle part, and a plurality of lifting-hooks spread by the handle part when moving upward relatively to the frame part.

813,885. **APPARATUS FOR TREATING AND ROASTING WASTE MATERIALS.** FREDERICK W. KOOKE, Philadelphia, Pa., assignor to J. Walter Douglass, trustee, Philadelphia, Pa. Filed Dec. 1, 1905. Serial No. 289,734.



Claim.—1. In an apparatus for treating and roasting waste matter, a receptacle or drum frusto-conical in outline, means for supporting said drum so as to hold the same with its central longitudinal axis in substantially a horizontal plane, a closure for said drum engaging the end having the greatest diameter, said drum arranged when rotated and when said closure is removed, to discharge the contents unaided.

2. In an apparatus for treating and roasting waste matter, a receptacle or drum frusto-conical in outline, an outlet arranged centrally to said drum and at the end of smallest diameter, a closure arranged at the end of greatest diameter, means for rotatably supporting said drum and for holding the same so that its central longitudinal axis is in substantially a horizontal plane, said drum arranged to receive waste matter and to remove liquid matter therefrom by evaporation through said outlet and when the closure is removed, to discharge the remaining matter unaided.

3. In an apparatus for treating and roasting waste matter, a receptacle or drum frusto-conical in outline, an outlet arranged centrally to said drum and at the end of smallest diameter, a closure arranged at the end of greatest diameter, means for rotatably supporting said drum and for holding the same so that its central longitudinal axis is in substantially a horizontal plane, said drum arranged to receive waste matter and to remove liquid matter therefrom, by evaporation, through said outlet and when the closure is removed, to discharge the remaining matter unaided, and an inlet for waste matter arranged in said drum intermediate of said outlet and closure and means for closing said inlet.

4. In an apparatus for treating and roasting waste matter, a receptacle or drum frusto-conical in outline, means for supporting said drum so as to hold the same with its central longitudinal axis in a horizontal plane, a closure for said drum engaging the end having the greatest diameter, said drum arranged when rotated and when said closure is removed, to discharge the contents unaided, and means arranged in said closure for removing portions of the contents when the closure engages said drum.

5. In an apparatus for treating and roasting waste matter, a receptacle or drum having open and closed ends, a tube forming an outlet for gaseous matter and supporting said receptacle at its closed end, a closure for said receptacle or drum, means for supporting said receptacle or drum at its open end, and means for surrounding said receptacle, said surrounding means arranged so as to permit of the heating of said receptacle or drum and of the discharge of the contents thereof, without loss of heat.

6. In an apparatus for treating and roasting waste matter, a receptacle or drum having open and closed ends, a tube forming an outlet for gaseous matter and supporting said receptacle or drum at its closed end, a closure for said receptacle or drum, means for supporting said receptacle or drum at its open end, an inlet-opening arranged in the body of said receptacle or drum, means for closing said inlet and means for rotating said tube and by the same, said receptacle or drum.

7. In an apparatus for treating and roasting waste matter, a receptacle or drum having open and closed ends, a tube forming an outlet for gaseous matter and supporting said receptacle at the closed end thereof, a closure for said receptacle or drum, at its open end, means surrounding said receptacle or drum and forming a furnace for the generation of heat and arranged so as to permit of discharge of the contents of said receptacle or drum, without loss of heat or interfering with the discharge of matter therefrom, means for supporting said receptacle or drum at its open end and beyond said furnace, an inlet arranged in said receptacle or drum, means for closing said inlet, means for rotating said tube and by the same said receptacle, and means arranged in the closure for said receptacle or drum for removing portions of the contents thereof, without removing said closure.

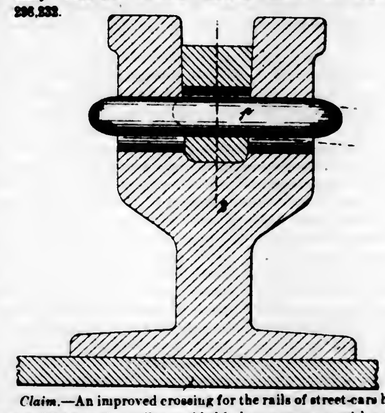
8. In an apparatus for treating and roasting waste matter, the combination of a frusto-conical receptacle or drum having open and closed ends and mounted in a furnace having an opening in the top with a closure therefor, a grate in the bottom of said furnace and an outlet for the escape of products of combustion from said furnace, doors in the body and one end of said receptacle or drum, means for supporting said receptacle or drum at its open end and for permitting of rotation thereof in said furnace and means for holding the end door of said receptacle or drum in operative position against back pressure.

813,886. **HOOK FOR CHAINS.** FRIEDRICH KRÄMER, Grüne, near Iserlohn, Germany, assignor to The Firm of Heinrich Witte, Grüne, near Iserlohn, Germany. Filed Sept. 6, 1905. Serial No. 277,260.

Claim.—1. In a safety-hook, a shank-piece *a*, having a longitudinal recess *e* in its forward end and a spiral spring *c'* in said recess, in combination with a hook *d* pivoted to said piece *a*, a counter-hook *d'* at the free end of hook *d*, a lug or shoulder d^3 of said hook engaging spring *c'*, a rearward projection d^2 of hook *d* engaging the shank-piece *a* to prevent the hook *d* from opening more than the distance necessary to securely lock the same and means directly and detachably connecting the said counter-hook to the said shank-piece, substantially as and for the purpose set forth.

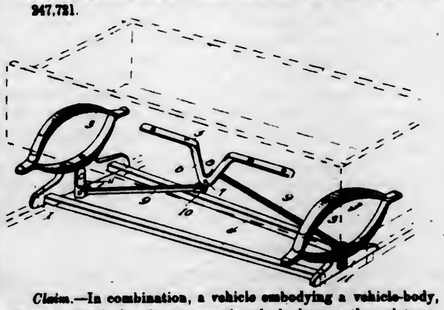
2. In a safety-hook, a shank-piece *a*, a recess *e* bored in the forward end thereof, a spring *c'* in said recess, a hook *d* pivoted to said shank-piece *a*, a counter-hook *d'* on the free end of said hook and a projection d^2 of said hook *d* bearing against said spring, in combination with a link *g* pivoted to the shank-piece *a* and adapted to engage the said counter-hook so as to lock the hook securely, substantially as set forth.

813,887. **RAIL-CROSSING.** FRIEDRICH A. LEHMANN, Berlin, Germany. Filed Nov. 10, 1903. Renewed Jan. 27, 1906. Serial No. 296,333.



Claim.—An improved crossing for the rails of street-cars having the usual intersecting rails provided in known manner with a slot in the trough-bottom for the reception of a filling-piece of metal for the flange of the wheel to bear on, comprising in combination horizontal bolts projecting through both walls of the trough as well as the said filling-piece, and horizontal borings within the latter arranged for a small space higher than the corresponding horizontal borings within the walls of the trough, substantially as described and shown and for the purpose set forth.

813,888. **EQUALIZING DEVICE FOR VEHICLE-SPRINGS.** JOHN A. ROTH, Hannibal, Ohio. Filed Feb. 28, 1905. Serial No. 247,721.



Claim.—In combination, a vehicle embodying a vehicle-body, axletrees, elliptical springs supporting the body upon the axletrees, the supporting-plate 5 secured at its ends to the under side of the body of the vehicle and having its central portion projected downwardly to form the vertical U-shaped extension 6, the lower extremity of the extension 6 being vertically widened and formed with the integral lateral pivot-stud 7, the bar 8 pivoted at a point between its ends to the pivot-stud 7 and arranged for movement in a vertical plane, the attaching-plates 11 secured to the axletrees, and the equalizing-bars pivotally attached at one end to the opposite ends of the pivot-bars 8 and having pivotal connection at the other end with the attaching-plates 11.

813,889. PROCESS FOR THE PREVENTION AND LAYING OF DUST IN ROADS, &c. WILLIAM M. SARMENT, Ashfield, Ayton, Scotland, assignor of one-half to Herbert G. McKerrow, Newton, Mass. Filed Feb. 22, 1905. Serial No. 247,232.

Claim.—1. The process herein described for laying dust, which consists in the application to the surface of roads or pavement dressing of an aqueous emulsion obtained by combining wool-fat with an alkali or alkaline salt, substantially as described.

2. The process herein described for laying dust, which consists in the application to the surface of roads or to pavement dressing of an aqueous emulsion obtained by combining wool-fat with an alkali or alkaline salt, and an oil-like substance, preferably creosote, substantially as described.

3. The herein-described process for the prevention of dust, which consists in the application to the surface of roads or to a road dressing, of a water-diluted emulsion obtained by combining wool-scouring suds with a suitable oil, or oil-like substance, preferably possessing disinfectant properties, as for example creosote, substantially as described.

4. The process of laying dust, which consists in the application to or saturation of the surface by a substance obtained by concentrating wool-scouring suds and combining with it an oil-like substance, preferably creosote, to produce a mass of semiliquid consistency, dilutable by water, for the purpose specified.

5. The process of preventing dust, which consists in the application to the surface of roads or to a road dressing of a substance obtained by concentrating wool-scouring suds, and adding to such suds as are lacking or poor in natural potash salts, a deliquescent salt, and combining with it an oil-like substance, preferably creosote, to produce a mass of semiliquid consistency dilutable by water, for the purpose specified.

6. The process of laying dust, which consists in the application to the surface of roads of an aqueous emulsion of wool-fat combined with alkali or alkaline salt preferably of a deliquescent nature, and containing in addition fine mineral matter of an absorbent and grease-retaining nature, substantially as specified.

7. The process of treating wool-scouring suds by concentrating the same and subsequently incorporating therewith an oil-like substance, preferably creosote, to produce a mass of semiliquid consistency capable of dilution by water, substantially as specified.

8. The process of treating wool-scouring suds by concentrating the same, by the adding to such concentrated suds as are lacking or poor in natural potash salts of a deliquescent salt, and by combining therewith an oil-like substance, preferably creosote, to produce a mass of semiliquid consistency dilutable by water, substantially as specified.

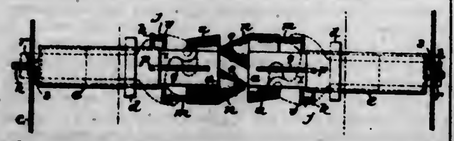
9. The process of treating wool-fat by adding suitable alkali or alkaline salt, preferably of a deliquescent nature and by combining therewith an oil-like substance, preferably creosote, to produce a mass of semiliquid consistency dilutable by water, substantially as specified.

10. The process herein described for laying dust, which consists in the application to the surface of roads of an aqueous emulsion obtained by combining the concentrated greases, fats or waxes recovered from trade or domestic effluents or wastes with an alkali or alkaline salt, substantially as described.

11. The process for preventing dust, which consists in the application to a surface of an aqueous emulsion of animal grease, fats or waxes combined with an alkali or alkaline salt, substantially as described.

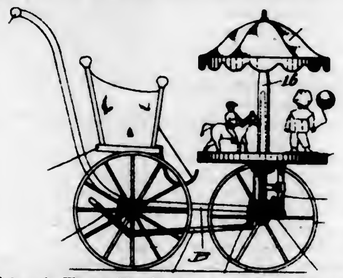
12. The process for preventing dust, which consists in spraying a surface with a water-diluted emulsion composed of animal greases or fats, an alkali or alkaline salt, preferably of a deliquescent nature, and an oil-like substance, preferably creosote, substantially as described.

813,890. AIR-BRAKE COUPLING. HERACLITUS H. SANFORD, Burroughs Cove, Tenn. Filed June 17, 1905. Serial No. 265,861.



Claim.—In train-pipe couplings, the combination of square coupling members bars to receive said members and means to yieldingly fasten said bars at their rear ends to cars, means to keep said coupling-heads from coming out of said bars when cars are uncoupled, train-pipes passing through said coupling-heads and bars, valves in said pipes and independent yielding means for holding said valves in position, and means for train-pipe yielding when cars are coupled, substantially as described.

813,891. ROTARY TOY FOR BABY OR DOLL CARRIAGES. WILLIAM SAXBY, Worcester, Mass. Filed Nov. 21, 1903. Serial No. 182,167.

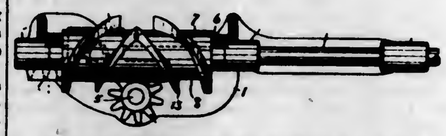


Claim.—1. The combination of a rotary platform mounted on a carriage so as to engage one of the carriage-wheels, and connections for raising the platform out of engagement with the carriage-wheel, comprising a lifting-rod, a bell-crank lever operating the lifting-rod, a foot-operated lever, and a link connecting the foot-operated lever and bell-crank lever.

2. The combination of a vertical spindle carried by a carriage, a rotary platform journaled on the spindle so as to engage one of the carriage-wheels, a canopy over the platform, and figures mounted thereon, a bearing-roll for the platform, and foot-controlled connections for lifting the platform away from the wheel when it is desired to stop the operation thereof.

3. The combination of a rotary platform mounted on a carriage so as to engage one of the carriage-wheels, and means for lifting the platform out of engagement with the wheel.

813,892. MECHANICAL MOVEMENT FOR WASHING-MACHINES. WARREN SWEET, Fort Wayne, Ind., assignor of one-half to Joseph Somers, Fort Wayne, Ind. Filed May 5, 1905. Serial No. 259,906.



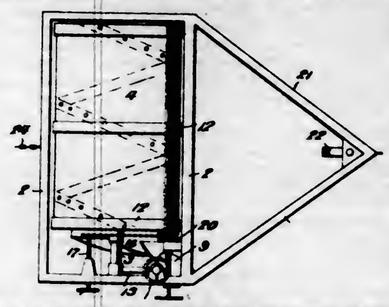
Claim.—In mechanism of the class described, a supporting-casting; a reciprocating rack and rotating actuating member mounted in connection with the casting, the actuating member having a continuous cam-groove which encircles the body of the member; a follower pivoted to the rack and ranging in the groove of the actuating member; and an antifriction-roller in connection with the follower and acting against the walls of the actuating member adjacent its groove.

813,893. EXCAVATING-MACHINE. THOMAS H. WALKER, Tumwater, Wash., assignor of one-fourth to Philip H. Corlyon, Olympia, Wash. Filed June 26, 1903. Serial No. 267,141.

Claim.—1. A machine of the character described, comprising a suitable frame, a shaft mounted thereon, a revoluble cylinder upon said shaft, a plow at one of the open ends of said cylinder, and means for directing the earth cut by the plow into said cylinder, substantially as described.

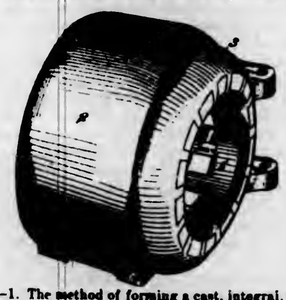
2. A machine of the character described, comprising a suitable frame, a shaft thereon, a revoluble cylinder upon said shaft, and open at its ends, a plow at one of the open ends of the cylinder, a spiral web within said cylinder, and a scoop or blade for directing the material or earth cut by said plow into said cylinder, substantially as described.

3. A machine of the character described, comprising a suitable frame, a shaft thereon, a revoluble cylinder upon the said shaft, a spiral web within said cylinder, a plow mounted at one of the open ends of said cylinder, means for adjusting said plow, a scoop or blade adapted to direct the earth cut by said plow into said cylinder, and means for adjusting said scoop or blade, substantially as described.



4. A machine of the character described, comprising a suitable frame, a shaft mounted thereon, a revoluble cylinder upon said shaft, a spiral web within said cylinder, a plow pivotally mounted at one of the ends of said cylinder, a screw for raising and lowering said plow, a swinging scoop or blade adapted to direct the earth cut by said plow into said cylinder, means for elevating said scoop or wing to permit the earth within said cylinder to be discharged and a caster-wheel at the front of said frame, substantially as described.

813,894. METHOD OF MAKING SAFES OR VAULTS. WALTER BARTON, High Bridge, N. J., assignor to Taylor Iron and Steel Company, a Corporation of New Jersey. Filed May 7, 1904. Serial No. 206,844.



Claim.—1. The method of forming a cast, integral, toughened, unmachineable safe or vault member or body which consists in first casting the body with resisting-metal inserts located therein around the doorway thereof, then placing the member or body in a heated furnace and applying the heat until the casting has reached a predetermined temperature, and then plunging the casting in cold water.

2. The method of forming a cast, integral, toughened, unmachineable safe or vault body having a predetermined quantity of manganese therein which consists in first casting the body with resisting-metal inserts located therein around the doorway thereof, and then heating such body, beginning with the furnace in a heated state and with the casting in a heated state, up to a predetermined temperature, and then cooling it.

3. The method of forming a cast, integral, toughened, unmachineable safe or vault body which consists in casting the body with resisting-metal inserts located therein around the doorway thereof, then maintaining in the body a part of its casting heat, determined by the size and design of such body, by checking the cooling of such body at a predetermined point above normal atmospheric temperature, then rapidly heating such body up to a predetermined temperature, and then immersing it in a cooling medium.

4. The method of forming a steel safe or vault member which consists in casting the member into its final shape with resisting-metal inserts located therein along its joint surface, then maintaining therein a part of its casting heat by checking the cooling of such member at a predetermined temperature above normal atmospheric temperature, and then heating said member up to a predetermined temperature and then cooling it.

5. The method of forming a steel safe or vault member having a predetermined quantity of manganese therein which consists in casting the member into its final shape with resisting-metal inserts located therein along its joint surface, then maintaining therein a part of its casting heat by checking the cooling of such member at a predetermined point above normal atmospheric temperature, determined by the size and design of the member, then heating such member up to a predetermined temperature, and then rapidly cooling the same.

6. The method of forming a manganese-steel safe or vault member which consists in casting the same into final shape with hard-metal inserts located therein along its joint surface, then maintaining therein a part of its casting heat by checking the cooling of such member at a predetermined point above normal atmospheric temperature, determined by the size and design of the member, then rapidly heating such member up to a predetermined temperature, and then rapidly cooling the same.

7. The method of forming a cast, integral, toughened manganese-steel safe or vault body which consists in casting the body into its final shape with resisting inserts located in such body around the doorway thereof, then maintaining therein a part of its original casting heat by preventing the too rapid cooling of such body, then heating said body up to a predetermined point, and then cooling it.

8. The method of forming a cast, integral, toughened manganese-steel safe or vault body which consists in casting the body into its final shape with chrome-steel inserts located in such body around the doorway thereof, then maintaining therein a part of its original casting heat by checking the cooling of such body, then rapidly heating such body up to a predetermined high temperature, and then immersing said body into a bath to rapidly cool it.

9. The method of forming a cast, integral, toughened steel safe or vault body having a predetermined quantity of manganese therein, which consists in casting the body with a projection or flange around its doorway with resisting-metal inserts in said flange, then maintaining in such body a part of its original casting heat determined according to the size and shape of such body, by checking the cooling thereof at a point above normal atmospheric temperature, then heating the body up to a predetermined high heat, and then rapidly cooling the same.

10. The method of forming a cast, integral, toughened safe or vault body having a predetermined quantity of manganese therein, which consists in first casting the body with resisting-metal inserts located therein around the doorway, then maintaining in the body a part of its original casting heat ranging between a point above normal atmospheric temperature and 1,000° Fahrenheit, determined according to the size and shape of such body, then placing the body in a heated furnace and heating the same rapidly up to a predetermined high temperature, and then rapidly cooling the same by immersion in a cooling medium.

REISSUES.

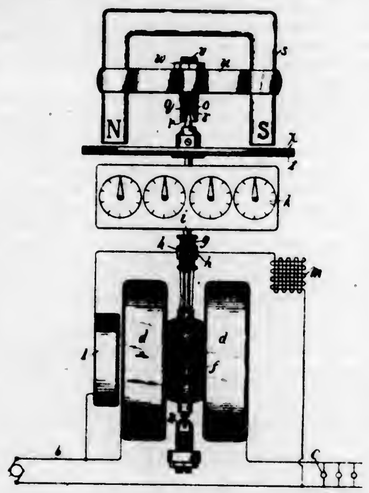
12,453. ELECTRIC METER. THOMAS DUNCAN, La Fayette, Ind., assignor to Duncan Electric Manufacturing Co., La Fayette, Ind., a Corporation of Illinois. Filed Aug. 9, 1905. Serial No. 273,426. Original No. 796,067, dated Aug. 1, 1905.

Claim.—1. The combination with a motor-wattmeter whose shaft has a lower bearing, and an upper inverted end-thrust bearing, of a magnetic suspension device for supporting the rotating element of the meter, and mechanism for effecting adjustment of the end-thrust bearing axially of the shaft, the bearing at the upper end of the shaft serving to aline the shaft at the upper end and to prevent lateral deflection thereof mechanically, substantially as described.

2. The combination with a motor-wattmeter whose shaft has a lower side-thrust bearing, and an upper inverted end-thrust bearing, of a magnetic suspension device for supporting the rotating element of the meter, and mechanism for effecting adjustment of the end-thrust bearing axially of the shaft, the bearing at the upper end of the shaft serving to aline the shaft at the upper end and to prevent lateral deflection thereof mechanically, substantially as described.

3. The combination with a motor-wattmeter whose shaft has a lower bearing, and an upper inverted end-thrust bearing substantially confining the upper end of the motor-shaft to a single axis of rotation, of a magnetic suspension device for supporting the rotating element of the meter, and mechanism for effecting adjustment of the end-thrust bearing axially of the shaft, the bearing at the upper end of the shaft serving to aline the shaft at the upper end and to prevent lateral deflection thereof mechanically, substantially as described.

4. The combination with a motor-wattmeter whose shaft has a lower side-thrust bearing, and an upper inverted end-thrust bearing, substantially confining the upper end of the meter-shaft to a single axis of rotation, of a magnetic suspension device for supporting the rotating element of the meter, and mechanism for effecting adjustment of the end-thrust bearing axially of the shaft, the bearing at the upper end of the shaft serving to aline the shaft at the upper end and to prevent lateral deflection thereof mechanically, substantially as described.



5. The combination with a motor-wattmeter whose shaft has a lower bearing, and an upper inverted end-thrust bearing, of a magnetic suspension device for supporting the rotating element of the meter, and mechanism for effecting adjustment of the end-thrust bearing axially of the shaft, said bearings substantially confining the shaft to a single axis of rotation, the bearing at the upper end of the shaft serving to aline the shaft at the upper end and to prevent lateral deflection thereof mechanically, substantially as described.

6. The combination with a motor-wattmeter whose shaft has a lower side-thrust bearing, and an upper inverted end-thrust bearing, of a magnetic suspension device for supporting the rotating element of the meter, and mechanism for effecting adjustment of the end-thrust bearing axially of the shaft, said bearings substantially confining the shaft to a single axis of rotation, the bearing at the upper end of the shaft serving to aline the shaft at the upper end and to prevent lateral deflection thereof mechanically, substantially as described.

7. The combination with a motor-wattmeter whose shaft has a lower bearing, and an upper inverted end-thrust bearing, of a magnetic suspension device for supporting the rotating element of the meter and including a body of magnetic material moving with the shaft and a stationarily-mounted magnet within whose field the said body of magnetic material is located, and mechanism for effecting adjustment of the end-thrust bearing axially of the shaft and with reference to said magnet, the bearing at the upper end of the shaft serving to aline the shaft at the upper end and to prevent lateral deflection thereof mechanically, substantially as described.

8. The combination with a motor-wattmeter whose shaft has a lower side-thrust bearing, and an upper inverted end-thrust bearing, of a magnetic suspension device for supporting the rotating element of the meter and including a body of magnetic material moving with the shaft and a stationarily-mounted magnet within whose field the said body of magnetic material is located, and mechanism for effecting adjustment of the end-thrust bearing axially of the shaft and with reference to said magnet, the bearing at the upper end of the shaft serving to aline the shaft at the upper end and to prevent lateral deflection thereof mechanically, substantially as described.

9. The combination with a motor-wattmeter whose shaft has a lower bearing, and an upper inverted end-thrust bearing substantially confining the upper end of the meter-shaft to a single axis of rotation, of a magnetic suspension device for supporting the rotating element of the meter and including a body of magnetic material moving with the shaft and a stationarily-mounted magnet within whose field the said body of magnetic material is located, and mechanism for effecting adjustment of the end-thrust bearing axially of the shaft and with reference to said magnet, the bearing at the upper end of the shaft serving to aline the shaft at the upper end and to prevent lateral deflection thereof mechanically, substantially as described.

10. The combination with a motor-wattmeter whose shaft has a lower side-thrust bearing, and an upper inverted end-thrust bearing, substantially confining the upper end of the meter-shaft to a single axis of rotation, of a magnetic suspension device for supporting the rotating element of the meter and including a body of magnetic material moving with the shaft and a stationarily-mounted magnet within whose field the said body of magnetic material is located, and mechanism for effecting adjustment of the end-thrust bearing axially of the shaft and with reference to said magnet, the bearing at the upper end of the shaft serving to aline the shaft at the upper end and to prevent lateral deflection thereof mechanically, substantially as described.

11. The combination with a motor-wattmeter whose shaft has a lower bearing, and an upper inverted end-thrust bearing, of a magnetic suspension device for supporting the rotating element of the meter and including a body of magnetic material moving with the shaft and a stationarily-mounted magnet within whose field the said body of magnetic material is located, and mechanism for effecting adjustment of the end-thrust bearing axially of the shaft and with reference to said magnet, said bearings substantially confining the shaft to a single axis of rotation, the bearing at the upper end of the shaft serving to aline the shaft at the upper end and to prevent lateral deflection thereof mechanically, substantially as described.

12. The combination with a motor-wattmeter whose shaft has a lower side-thrust bearing, and an upper inverted end-thrust bearing, of a magnetic suspension device for supporting the rotating element of the meter and including a body of magnetic material moving with the shaft and a stationarily-mounted magnet within whose field the said body of magnetic material is located, and mechanism for effecting adjustment of the end-thrust bearing axially of the shaft and with reference to said magnet, said bearings substantially confining the shaft to a single axis of rotation, the bearing at the upper end of the shaft serving to aline the shaft at the upper end and to prevent lateral deflection thereof mechanically, substantially as described.

13. The combination with a motor-wattmeter whose shaft has a lower bearing and an upper inverted end-thrust bearing, of a magnetic device including a stationarily-mounted magnet and a body of magnetic material moving with the rotating element of the meter and arranged within the field of said magnet, said end-thrust bearing being constructed to confine the upper end of the shaft to a substantially fixed axis of rotation, the bearing at the upper end of the shaft serving to aline the shaft at the upper end and to prevent lateral deflection thereof mechanically, substantially as described.

14. The combination with a motor-wattmeter whose shaft has a lower side-thrust bearing and an upper inverted end-thrust bearing, of a magnetic device including a stationarily-mounted magnet and a body of magnetic material moving with the rotating element of the meter and arranged within the field of said magnet, said bearings serving to confine the shaft to a substantially fixed axis of rotation, the bearing at the upper end of the shaft serving to aline the shaft at the upper end and to prevent lateral deflection thereof mechanically, substantially as described.

15. The combination with a motor-wattmeter whose shaft has a lower bearing and an upper inverted end-thrust bearing, of a magnetic device including a stationarily-mounted magnet and a body of magnetic material moving with the rotating element of the meter and arranged within the field of said magnet, said bearings serving to confine the shaft to a substantially fixed axis of rotation, the bearing at the upper end of the shaft serving to aline the shaft at the upper end and to prevent lateral deflection thereof mechanically, substantially as described.

16. The combination with a motor-wattmeter, of a stationarily-mounted suspending magnet and a disk of magnetic material upon the shaft and within the field of said magnet to support the rotating element of the meter, and a damping or retarding disk also subject to the influence of said magnet that thus acts also as a damping-magnet, said disks being assembled into a compound disk, the bearing at the upper end of the shaft serving to aline the shaft at the upper end and to prevent lateral deflection thereof mechanically, substantially as described.

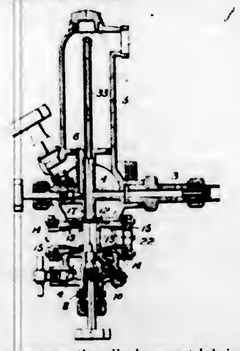
17. The combination with a motor-wattmeter, of a stationarily-mounted suspending magnet, and a compound disk of magnetic and non-magnetic metal upon the shaft and within the field of said magnet to support and retard the rotating element of the meter, the bearing at the upper end of the shaft serving to aline the shaft at the upper end and to prevent lateral deflection thereof mechanically, substantially as described.

18. The combination with a motor-wattmeter, of a stationarily-mounted suspending magnet and a disk of magnetic material upon the shaft and within the field of said magnet to support the rotating element of the meter, and a damping or retarding disk also subject to the influence of said magnet that thus acts also as a damping-magnet, said disks being assembled into a compound disk, substantially as described.

19. The combination with a motor-watt-meter, of a stationarily-mounted suspending magnet, and a compound disk of magnetic and non-magnetic metal upon the shaft and within the field of said magnet to support and retard the rotating element of the meter, substantially as described.

20. The combination with a motor-meter, of a suspending magnet, and a compound disk of magnetic and non-magnetic metal upon the shaft and within the field of said magnet to support and retard the rotating element of the meter, substantially as described.

12,454. LUBRICATOR. CLARENCE B. HODGES and FREDERICK W. HODGES, Detroit, Mich. Filed Mar. 3, 1905. Serial No. 248,335. Original No. 752,554, dated Feb. 16, 1904.



Claim.—1. In a condensation displacement lubricator, an oil-reservoir having its axis in a substantially horizontal plane and its interior braced by tubing, combined with sight-feed glasses having horizontal axes and being mounted within portions of said tubing, substantially as set forth.

2. In a lubricating apparatus, a condensing-chamber and an oil-reservoir, the latter having its axis in a substantially horizontal plane, and horizontal and vertical tubes within the reservoir for bracing the same, the whole being integral, combined with sight-feed glasses having horizontal axes and being mounted within portions of said tubular bracing, substantially as set forth.

3. In a condensation displacement lubricator, an oil-reservoir having one or more tubular braces extending from side to side of the reservoir, and oil-feed tubes extending between points in the shell of the reservoir above and below the horizontal plane in which said tubular braces lie and intersecting said braces, substantially as set forth.

4. In a lubricating apparatus, an oil-reservoir having its axis in a horizontal plane, tubular braces extending from side to side of the reservoir, and oil-feed tubes intersecting said braces and extending through said reservoir, combined with sight-feed glasses having horizontal axes and being removably mounted in pairs in said tubular braces, substantially as set forth.

5. In a lubricating apparatus, an oil-reservoir having its axis in a horizontal plane, interior tubular braces extending from side to side of the reservoir, and oil-feed tubes intersecting said braces and extending through said reservoir, the entire structure being integrally formed, combined with sight-feed glasses in pairs, each pair having a common horizontal axis and being mounted in one of said interior tubular braces, substantially as set forth.

6. In a lubricating apparatus, an oil-reservoir the side walls of which are interiorly connected and braced by tubular chambers, and provided with oil-feed tubes intersecting said chambers and extending between the walls of the reservoir, substantially as set forth.

7. In a lubricating apparatus, an oil-reservoir the side walls of which are interiorly connected and braced by a tubular chamber, and an oil-feed tube extending from said tubular chamber to the top and bottom walls of said reservoir, said reservoir, chamber, and oil-feed tubes being integral, substantially as set forth.

8. In a lubricating apparatus, an oil-reservoir the opposite sides of which are connected by a tubular brace or chamber, the said brace or chamber being intersected by an oil-feed tube combined with sight-feed glasses supported by said tubular brace or chamber, substantially as set forth.

9. In a lubricating apparatus, an oil-reservoir having its axis in a horizontal plane and being provided with a series of horizontal tubular braces or chambers connecting its interior sides, and oil-feed pipes intersecting said braces or chambers, combined with sight-feed glasses arranged in pairs, each pair having a common axis and being supported by one of said tubular braces or chambers, substantially as set forth.

10. In a lubricating apparatus, an oil-reservoir having a series of parallel tubular braces or chambers interiorly connecting its sides, and oil-feed pipes intersecting and extending from said tubular braces or chambers to the walls of said reservoir, combined with sight-feed glasses supported by each tubular brace or chamber, substantially as set forth.

11. In a lubricating apparatus, an oil-reservoir having its axis in a horizontal plane and being provided with a series of tubular braces or chambers connecting its interior sides, and oil-feed pipes intersecting such braces or chambers, combined with sight-feed glasses arranged in pairs, each pair having a common axis and being removably mounted in one of said tubular braces or chambers, substantially as set forth.

12. In a lubricating apparatus, an oil-reservoir having a series of tubular braces or chambers connecting its interior sides, and oil-pipes intersecting such braces or chambers, combined with a sight-feed glass in each end of each of said tubular braces or chambers, substantially as set forth.

13. In a lubricating apparatus, an oil-reservoir having a series of tubular braces or chambers connecting its interior sides, and oil-feed pipes intersecting said braces or chambers and extending between the walls of the reservoir, combined with sight-feed glasses arranged in pairs, each pair having a common axis and being removably mounted in one of said tubular braces or chambers within the body of said reservoir, substantially as set forth.

14. In a lubricating apparatus, an oil-reservoir having a series of tubular braces or chambers connecting its interior sides, and oil-feed pipes intersecting said braces or chambers and extending between the walls of the reservoir, combined with a sight-feed glass in each end of each of said tubular braces or chambers within the body of said reservoir, substantially as set forth.

15. In a lubricating apparatus, an oil-reservoir having a series of parallel tubular braces or chambers interiorly connecting its sides, and parallel oil-feed pipes intersecting and extending from said tubular braces at a right angle thereto to the walls of said reservoir, combined with a sight-feed glass in each end of each of said tubular braces or chambers within the body of said reservoir, substantially as set forth.

16. In a lubricator, the combination of a condensing-chamber, an oil-reservoir, and a series of sight-feed features connected thereto, each sight-feed feature comprising a sight-feed chamber, sight-feed glasses at opposite ends thereof, a single nozzle for delivering oil, and an independent equalizing-tube leading from the steam-space of the condenser, the sight-feed chambers being so arranged that three of them are visible from common points of observation on opposite sides.

17. In a condensation displacement lubricator, an oil-reservoir and a condensing-chamber, the walls of which reservoir are interiorly connected and braced by one or more tubular chambers, combined with sight-feed glasses supported in said tubular chambers, and oil-feed pipes intersecting said chambers and having at their lower ends valve-controlled passages for permitting the flow of oil from the oil-reservoir, substantially as set forth.

18. In a lubricator, the combination of a condenser and an oil-reservoir the latter having an oil-feed pipe passing vertically therethrough, a tubular chamber supported within the oil-reservoir and intersected by the oil-feed pipes, an oil-delivery nozzle entering said tubular chamber, and a sight-feed glass placed on each side of said nozzle and supported by said chamber, substantially as set forth.

19. In a lubricator, the combination of a condenser, an oil-reservoir having oil-feed pipes passing therethrough, a tubular chamber connected to each oil-feed pipe, each of said chambers extending be-

tween the opposite walls of said reservoir, a sight-feed glass in each end of each chamber, and an oil-delivery nozzle situated between each pair of sight-feed glasses, substantially as set forth.

20. In a lubricator, the combination of an oil-reservoir containing within itself an oil-feed pipe having an enlarged portion extending between and connected to the side walls of said reservoir, a glass in each end of said enlarged portion, and a nozzle arranged to deliver oil between said glasses, substantially as set forth.

21. In a lubricator, the combination of an oil-reservoir, vertical oil-feed pipes passing therethrough, each pipe having oppositely-arranged enlarged horizontal branches, and observation-glasses removably mounted in said enlarged horizontal branches within the compass of the reservoir, substantially as set forth.

22. The combination in a sight-feed lubricator, with a water-chamber and a nozzle through which the oil is delivered in drops in order to ascend through the water in said chamber, of an observation-glass or bull's-eye having a side or surface adapted to internally reflect, so as to be visible to the observer, the position and movement of the lubricant, substantially as set forth.

23. A lubricator having a sight-feed passage combined with an observation-glass so constructed as to constitute a mirror by internal reflection and adapted to reflect for observation the position and movement of liquid behind the glass, substantially as set forth.

24. The combination, in a sight-feed lubricator, with a water-chamber and a nozzle through which the oil is delivered in drops to the water in said chamber, of an observation-glass or bull's-eye having polished surfaces adapted to internally reflect, so as to be visible to the observer, when out of the direct line of sight, the position and movement of the lubricant, a casing in which said bull's-eye is retained, a packing for said bull's-eye, and a cap for the casing, substantially as set forth.

25. The combination, in a sight-feed lubricator, with a water-chamber and a nozzle through which the oil is delivered in drops in order to ascend through the water in said chamber, of an observation-glass or bull's-eye having a polished surface, or surfaces, at an angle to its longitudinal axis, a packing adapted to the shape of said surface or surfaces, a casing to receive said bull's-eye, and a retaining-cap for the casing, substantially as set forth.

26. In a lubricator, the combination with an observation-chamber through which the oil ascends in drops, of a thick observation-glass having parallel front and rear ends, and side surfaces adapted to inwardly direct rays of light in order to exhibit the position and movement of liquid behind the glass, substantially as set forth.

27. In a lubricating apparatus, an oil-reservoir having an integral horizontal tubular chamber extending therethrough and an oil-feed pipe intersecting said chamber, combined with cells adapted to be fitted within the tubular chamber, and observation-glasses mounted in said cells, substantially as set forth.

28. In a lubricating apparatus, an oil-reservoir having a horizontal tubular chamber extending therethrough and an oil-feed pipe intersecting said chamber, combined with cells adapted to be removably fitted within said tubular chamber, and observation-glasses removably mounted in said cells, substantially as set forth.

29. In a lubricating apparatus, an oil-reservoir having a tubular chamber forming a part thereof, and an oil-feed pipe intersecting said chamber, combined with observation-glasses connected so as to constitute mirrors by internal reflection, said glasses being removably mounted within said chamber, substantially as set forth.

30. In a lubricating apparatus, an oil-reservoir having a tubular chamber forming a part thereof, and an oil-feed pipe intersecting said chamber, combined with cells fitted to said tubular chamber, an observation-glass having exterior sides angular with reference to its axis, mounted within each cell, a wedge-packing for each glass, and retaining-caps, substantially as set forth.

31. In a lubricating apparatus, an oil-reservoir having a tubular chamber forming a part thereof and an intersecting oil-feed pipe, combined with observation-glasses having surfaces arranged to produce internal reflection, and means for mounting said glasses within said tubular chamber, substantially as set forth:

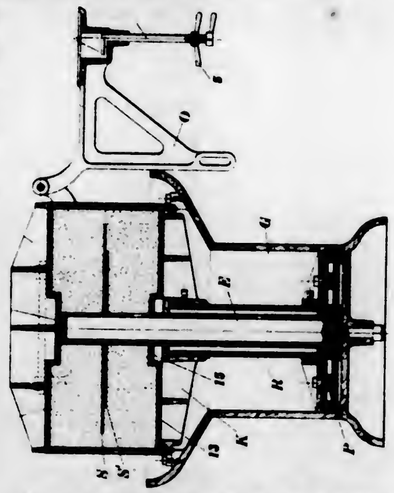
32. In a lubricating apparatus, an oil-reservoir having a tubular chamber forming a part thereof and an intersecting oil-feed pipe, combined with observation-glasses having exterior sides angular with respect to their axes, cells for containing the observation-glasses a packing around each glass, and means for forcing the packing into contact with the angular sides of the glass and the inner wall of its cell, substantially as set forth.

33. In a lubricator, the combination with an observation-chamber through which the oil ascends in drops, of a removable cell arranged in relation to said chamber, and a thick observation-glass removably mounted in said cell, said glass having parallel front and rear ends and side surfaces adapted to inwardly direct rays of light in order to exhibit the position and movement of liquid behind the glass, substantially as set forth.

34. In a lubricator, the combination with an observation-chamber through which the oil ascends in drops, of a thick observation-glass suitably mounted in relation to said chamber, a tapered or wedge-shaped packing surrounding said glass, and a cap for compressing the packing around the glass, substantially as set forth.

35. In a lubricator, the combination with a condensation-chamber, of an oil-reservoir, a plurality of sight-feed features comprising tubular chambers arranged horizontally adjacent to each other and having observation-glasses at opposite ends thereof so as to enable inspection from common points of observation on opposite sides of the lubricator and extending in a direction crosswise the reservoir, oil-feeds to the sight-feeds, and an independent equalizing-tube leading from the steam-space of the condenser to each sight-feed.

12,455. **FILTER-PULP-PACKING MACHINE.** KARL KIEFER, Cincinnati, Ohio. Filed Nov. 20, 1905. Serial No. 288,235. Original No. 797,122, dated Aug. 15, 1905.



Claim.—1. In a filter-pulp-packing machine, the combination of an exterior stationary cylinder, of a stationary central cylinder, a porous bottom moving longitudinally and snugly fitting into the ring-shaped space between the two cylinders, and a removable cover.

2. In a filter-pulp-packing machine, the combination of an exterior stationary cylinder, of a stationary central cylinder, a porous bottom moving longitudinally and snugly fitting into the ring-shaped space between the two cylinders, a removable cover and a liquid-conductor between bottom and cover.

3. In a filter-pulp-packing machine, the combination of an exterior stationary cylinder, of a stationary central cylinder, a porous bottom moving longitudinally and snugly fitting into the ring-shaped space between the two cylinders, and a removable porous cover.

4. In a filter-pulp-packing machine, the combination of an exterior stationary cylinder, of a stationary central cylinder, a porous bottom moving longitudinally and snugly fitting into the ring-shaped space between the two cylinders, a removable cover and a liquid-conductor within the exterior cylinder, cover and bottom.

5. In a filter-pulp-packing machine, the combination of an exterior stationary and non-porous cylinder, a central and stationary cylinder, a framework upon which both cylinders are fastened, a hydraulic and ring-shaped piston with a central opening, carrying a filter-mass-pressing plate with a removable open-work disk, a cover removable so as to gain access to the interior of the stationary cylinder, and to insert the liquid-conductor.

6. In a filter-pulp-packing machine, the combination of an exterior cylinder, an interior cylinder much smaller in diameter, a liquid-conductor longitudinally movable on one of said cylinders and spaced apart from the other, a bottom part movable in relation to said cylinders, and a cover that can be removed to gain access into the interior of the exterior cylinder.

7. In a filter-pulp-packing machine, a filter-layer-reversing mechanism, consisting of a frame part, revolvable one hundred and eighty degrees relative to a supporting-point, a clamping mechanism adapted to take hold of the bottom press-plate of the packing-machine during the act of reversing, and release it again for the purpose of the removal of the filter layers.

8. In a filter-pulp-packing machine, the combination with a filter-layer-press mechanism proper, of a reversing mechanism having a frame part fulcrumed in a horizontal plane near the top of the machine, having a clamping arrangement adapted to take hold of the press-plate of the packing-machine, filter layer, liquid-conductor and auxiliary press-plate, and adapted to move one hundred and eighty degrees around the fulcrum of the frame.

9. In a filter-pulp-packing machine, the combination of a container, a bottom and cover to such container, at least one of them fitting snugly within the container and sliding therein, means for approaching the bottom and top part so as to express the water from the pulp, and means producing during such approach a materially stronger compression to some parts of the pulp than to others.

10. In a filter-pulp-packing machine, the combination of a container, of a plane bottom and a plane cover to such container, means of approaching both of them so as to express the liquid from the pulp within the container, of protuberances attached to the bottom and top adapted to produce a stronger compression upon the filter-pulp in contact with said protuberances than is produced upon the rest of the filter-pulp.

11. In a filter-pulp-packing machine, the combination of a container, of a plane bottom and a plane cover to such container, means of approaching both of them so as to express the liquid from the pulp within the container, of porous protuberances attached to the bottom and top, adapted to produce a stronger compression upon the filter-pulp in contact with said porous protuberances than is produced upon the rest of the filter-pulp.

12. In a filter-pulp-packing machine, the combination of an exterior cylinder, of an interior cylinder, of a bottom and top part, one of said parts snugly fitting into the ring-shaped space between the two cylinders and moving longitudinally therein, of ring-shaped protuberances attached to the moving part adapted to produce a stronger compression upon the filter mass in contact therewith than is produced upon the rest of the filter mass.

13. In a filter-pulp-packing machine, the combination of a stationary exterior cylinder, of a central stationary cylinder, a framework on which both cylinders are fastened, a porous plane bottom moving longitudinally and snugly fitting into the ring-shaped space between the two cylinders, of a removable cover, of ring-shaped protuberances adapted to produce stronger compression to the pulp and attached to the cover, of a liquid-conductor within the exterior cylinder, interior cylinder, cover and bottom.

14. In a filter-pulp-packing machine, the combination of a stationary exterior non-porous cylinder, of a central stationary interior cylinder, of a framework on which both cylinders are fastened, a porous bottom moving longitudinally and snugly fitting into the ring-shaped space between the two cylinders, of a removable cover, of ring-shaped porous protuberances between bottom and cover, of a liquid-conductor within the exterior cylinder, interior cylinder, cover and bottom.

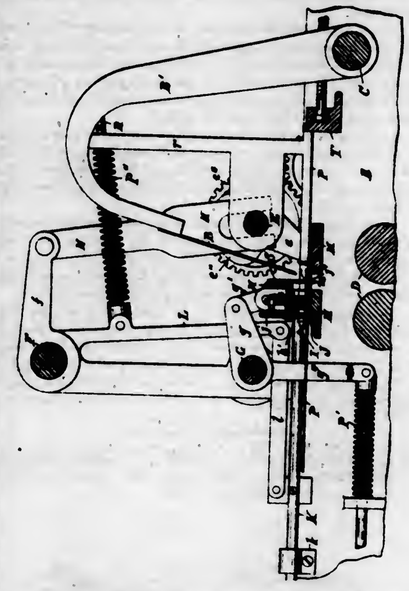
15. In a filter-pulp-packing machine, the combination of a stationary exterior cylinder, of a central interior cylinder, of a bottom plate and a top plate, one of them fitting snugly within the ring-shaped space between the two cylinders, moving longitudinally therein, and having ring-shaped protuberances concentrically arranged, the latter adapted to more compress the filter-pulp in contact therewith than the rest of the filter-pulp.

16. A filter-layer-reversing mechanism consisting of a frame part, revolvably fulcrumed, in combination with a clamping mechanism to take hold of the filter layers between two rigid disks, whereby said filter layers may be reversed one hundred and eighty degrees.

17. A filter-layer-reversing mechanism consisting of a frame part, in combination with a clamping mechanism for compressing the filter layers between two metal plates, said frame part fulcrumed so as to be revolvable one hundred and eighty degrees.

12,456. **PAPER-SLITTING DEVICE FOR FOLDING-MACHINES.** WILLIAM A. LA ROE, Ridgway, N. J., and CHARLES M. SMITH, New York, N. Y. Filed June 16, 1905. Serial No. 265,749. Original No. 751,166, dated Feb. 2, 1904.

Claim.—1. In a paper-folding apparatus, the combination with the folding means, of slitting devices, means for operating said devices to effect the slitting, and means for moving said devices toward and away from the folding means.



2. In a paper-folding apparatus, the combination with the folding means, of slitting devices including a slitting-blade and paper-support, means for operating said devices to effect the slitting, and means for moving the blade and support toward and away from the folding means.

3. In a paper-folding apparatus, the combination with the folding means, of slitting devices, means for operating said devices to effect the slitting, and means for giving said devices a movement toward and away from the folding means, said movement being parallel to the plane of the paper.

4. In a paper-folding apparatus, the combination with the folding means, of slitting devices including a slitting-blade and paper-support, means for operating said devices to effect the slitting, and means for moving the blade and support toward and away from the folding means, said movement being parallel to the plane of the paper.

5. In a paper-folding apparatus, the combination with a cross-head, of a slitting-blade carried thereby, a paper-support, means for moving the cross-head and support into and out of slitting position, and means for effecting a slitting movement of the blade.

6. In a paper-folding apparatus, the combination with a cross-head, of a presser-foot carried thereby, a slitting-blade mounted thereon, a paper-support, and means for moving the cross-head and support toward and away from the slitting position, and means for effecting a movement of the blade.

7. In paper-folding apparatus, the combination with the folding-blade and rollers of a series of V-shaped slitting-teeth which are elliptical in cross-section, said teeth being arranged parallel to said folding mechanism, and means for actuating the same whereby the paper is partially severed without injury to its fiber along the line of fold, substantially as set forth.

8. In paper-folding apparatus, the combination with the folding-blade and folding-rollers of a series of slitting-teeth which are elliptical in cross-section, said elliptical teeth being arranged parallel to said folding mechanism, and means for actuating the same whereby the paper is partially severed without injury to its fiber along the line of fold for the purposes set forth.

9. In paper-folding apparatus, the combination with the folding blade and rollers, of a series of V-shaped slitting-teeth elliptical in cross-section, arranged substantially parallel to said folding mech-

anism, means for actuating said V-shaped slitting-teeth, means for supporting the paper against the action of said V-shaped slitting-teeth, and means for adjusting the said V-shaped slitting-teeth with relation to said support for the paper, whereby the length of the slits formed by said V-shaped slitting-teeth may be varied, substantially as described.

10. In paper-folding apparatus, the combination with the folding blade and rollers, of slitting-teeth S, cross-head H, links g', arms g, rock-lever G, flanged heads g^4, secured thereto, the set-nuts g'' g'', on said heads g^4, and the levers g^3, and bearing-rollers g^5, together with the cams e, upon the shaft E, the whole arranged and operating substantially as and for the purpose set forth.

11. In paper-folding apparatus, the combination with the folding blade and rollers, of the cross-head H, the slitting-teeth S, the presser-plate I, springs h', rest-plate J, and means for moving the cross-head and rest-plate into and out of operative position, substantially as described.

12. In a paper-folding apparatus, the combination with the folding blade and rolls, of the cross-head H, the slitting-teeth S, the presser-plate I formed with the slots i, springs h', the rest-plate J formed with slots j'', and means for moving the cross-head and rest-plate into and out of operative position, substantially as set forth.

13. In paper-folding apparatus, the combination with the folding blade and rollers, of the cam-shaft E, and cams e, e', rock-shaft G, and arms g, g^3, links g', cross-head H, and slitting-teeth S, the links N and L, rock-shaft F, and arms f, links l, slide-rods K, cross-head H, slitting-teeth S, presser-plate I, rest-plate J, the whole arranged and operating substantially in the manner and for the purpose described.

12,457. **LEATHER-STRETCHING CLAMP.** CHARLES B. RAYBURN, Canton Junction, Mass. Filed Nov. 20, 1905. Serial No. 288,700. Original No. 796,531, dated Aug. 8, 1905.

Claim.—1. In a clasp of the class described, the combination of a main plate provided at one end with a hole, and at its other end with transverse corrugations and with a pair of ears projecting upward and forward, a relatively movable jaw-plate provided at one end with a hole, and at its other end with transverse corrugations, said plate lying between the ears and being attached to the main plate by an eyelet passed through the holes in the two plates, and a lever pivoted between the forward ends of the ears, and having its forward end when the lever is in clamping position curved forwardly and downwardly in front of the pivots and then rearwardly, whereby when the lever is swung over backwardly said curved forward end will press the movable jaw toward the main jaw.

2. In a clasp of the class described, the combination of a substantially straight main plate whose forward end is adapted to serve as a jaw and whose rear end is provided with a hole and which is provided at its edges with upturned ears, another plate of substantially the same length and width as the main plate and which is adapted to lie and work between said ears and whose rear end is bent down so as to lie upon the rear end of the main plate, this downward-bent rear portion being provided with a hole, an eyelet passed through the holes in the two plates and serving to permanently connect the plates together, and an opening and closing cam-lever mounted between said ears, substantially as set forth.

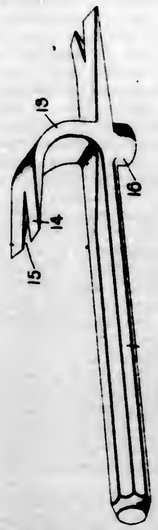
3. In a clamp or clasp, the combination of a pair of plates attached rigidly and permanently together at one end, and adapted to spring apart at their other ends, these latter ends serving as jaws, ears carried by one of the plates, and a closing and locking lever pivotally mounted between said ears, and having its forward end when the lever is in clamping position extending forward beyond the pivotal point and downwardly and rearwardly and made resilient, so that it will press and lock the two jaws together resiliently when the handle end of the lever is swung backward.

4. In combination with a pair of body-plates attached together at their rear ends and adapted to swing apart at their forward ends, one of the plates being provided with ears embracing the other plate, a lever pivotally mounted between these ears and having its forward end when in clamping position curved forward and downward and rearward and made resilient, so that it will act as a spring-cam in closing the jaws, this cam portion being provided with a lateral lug adapted to strike against the ears and limit the movement of the lever when it is thrown upward and forward to open the clamp, substantially as set forth.

5. In a clamp of the class described, the combination of a main plate adapted for attachment to a cord at its rear end and carrying a pair of side ears which extend forwardly to form an open mouth between the forward ends of the ears and the main plate, and clamping means embodying a self-locking lever pivoted between the forward ends of said ears, the forward end of this lever when in locked position being extended forwardly of the pivot and curved toward the main plate and then rearwardly to form a resilient closing-cam, whose free rearwardly-extending end affords a broad resilient clamping-bearing opposite the pivots of the lever.

6. A clamp comprising a main part adapted at its rear end for attachment to a cord and carrying clamping means at its forward end, said clamping means embodying a pair of forwardly-extending side ears and a clamping-lever, said lever being pivoted between the forward ends of said ears and having its forward end curled into a resilient cam, which cam when the lever is in clamping position has its curved nose portion lying forward of the pivots and its free resilient end portion curving backwardly to a point back of the pivots, whereby when the clamp is closed the free resilient end portion of the cam will afford a broad cam-bearing directly opposite the pivots, whereby a wide range of thicknesses of leather can be accommodated and the cam alone will lock the lever in its clamping position.

12,458. **COMBINATION-TOOL.** ROBERT A. RAGSDEY, Belton, Tex., assignor to Keller Bee Opener Company, Sedalia, Mo., a Copartnership. Filed Sept. 8, 1905. Serial No. 277,639. Original No. 736,753, dated Sept. 15, 1903.

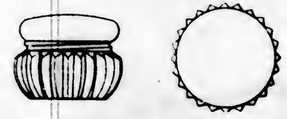


Claim.—A tool comprising a stock having a wedge-shaped end extending in longitudinal alinement therewith, a claw member composed of a flattened arm extending laterally from one of the flattened faces of said wedge-shaped stock-terminal and spaced from the end thereof, said arm being curved rearwardly at a point intermediate of its ends with the free end thereof extended in a plane parallel with the plane occupied by the stock, said claw member and wedge-shaped stock-terminal having V-shaped clefts therein opening in opposite directions; substantially as described.

DESIGNS.

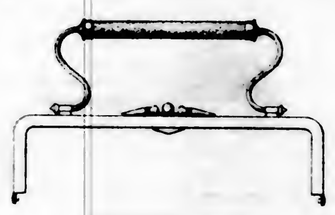
37,829. **JAR.** JOHN ELLWOOD LEE, Coatesville, Pa., assignor to Johnson and Johnson, New Brunswick, N. J., a Corporation of New Jersey. Filed Dec. 11, 1905. Serial No. 291,361. Term of patent 14 years.

37,829.



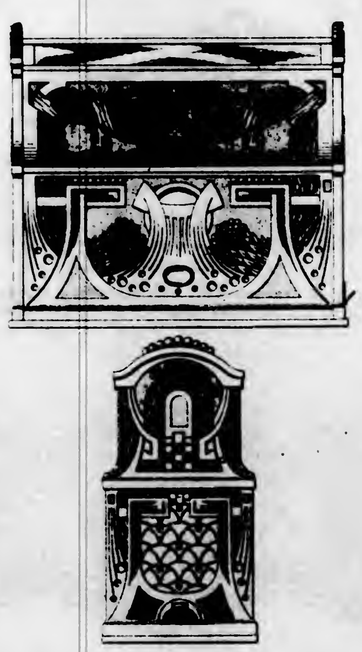
Claim.—The ornamental design for a jar, as shown.

37,830. **HAND-BAG FRAME.** WILHELM STAVENHAGEN, Weehawken, N. J. Filed Nov. 24, 1905. Serial No. 288,962. Term of patent 3½ years.



Claim.—The ornamental design for a hand-bag frame as shown.

37,831. **CASING FOR TOY SHOOTING APPARATUS.** HUGO KUNKEL, Cologne-Lindenthal, Germany. Filed Nov. 23, 1905. Serial No. 288,818. Term of patent 7 years.

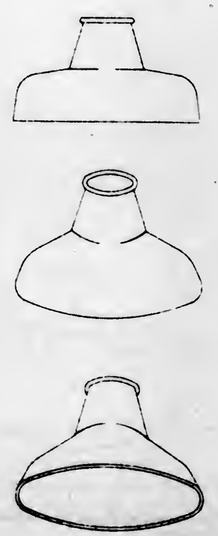


Claim.—The ornamental design for a casing for a toy shooting apparatus, as shown.

37,832. **REFLECTOR FOR INCANDESCENT ELECTRIC LAMPS.** OTIS A. MYGATT, New York, N. Y. Filed July 15, 1905. Serial No. 269,893. Term of patent 14 years.

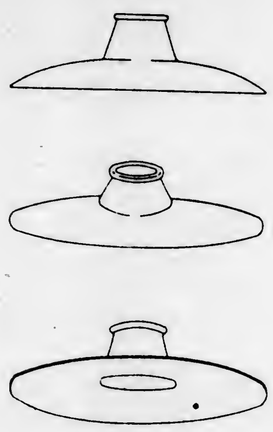
Claim.—The ornamental design for a reflector for incandescent electric lamps, as shown.

37,833. **REFLECTOR FOR INCANDESCENT ELECTRIC LAMPS.** OTIS A. MYGATT, New York, N. Y. Filed July 17, 1905. Serial No. 270,143. Term of patent 14 years.



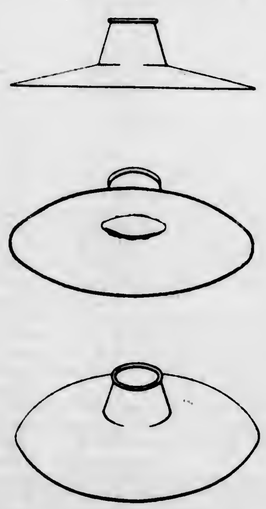
Claim.—The ornamental design for a reflector for incandescent lamps, as shown.

37,884. REFLECTOR FOR INCANDESCENT ELECTRIC LAMPS. OTIS A. MYGATT, New York, N. Y. Filed July 31, 1905. Serial No. 272,126. Term of patent 14 years.



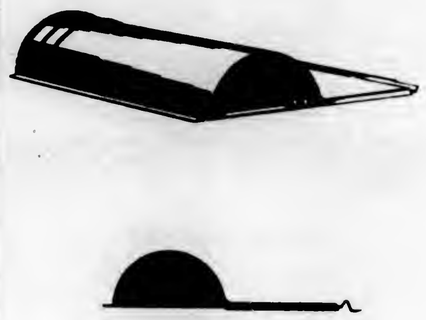
Claim.—The ornamental design for a reflector for incandescent electric lamps, as shown.

37,885. REFLECTOR FOR INCANDESCENT ELECTRIC LAMPS. OTIS A. MYGATT, New York, N. Y. Filed Aug. 1, 1905. Serial No. 272,264. Term of patent 14 years.



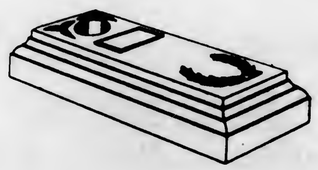
Claim.—The ornamental design for a reflector for incandescent electric lamps, as shown.

37,886. TILE. WILLIAM S. GODDARD, Brooklyn, N. Y., assignor to Mosaic Brick Co., Brooklyn, N. Y. Filed Aug. 30, 1905. Serial No. 276,469. Term of patent 14 years.



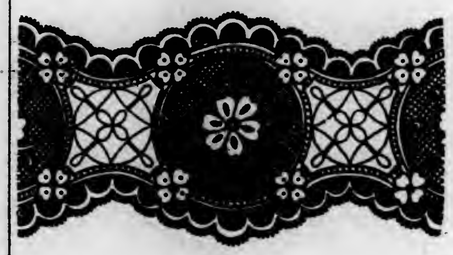
Claim.—The ornamental design for a tile, as shown.

37,887. GRAVE-COVER. WALTER J. HUBER, Dubuque, Iowa, assignor of one-half to William Imhoff, Dubuque, Iowa. Filed Oct. 5, 1905. Serial No. 277,696. Term of patent 7 years.



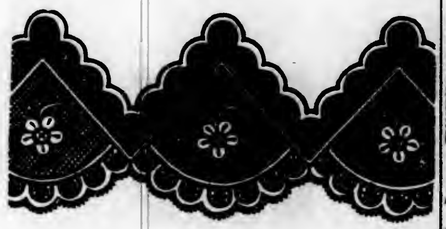
Claim.—The ornamental design for a grave-cover as shown.

37,888. LEVERS LACE. CHARLES W. BIRKIN, Nottingham, England. Filed Jan. 6, 1906. Serial No. 294,976. Term of patent 3½ years.



Claim.—The ornamental design for Levers lace as shown

37,839. LEVERS LACE. CHARLES W. BIRKIN, Nottingham, England. Filed Jan. 12, 1906. Serial No. 296,894. Term of patent 3½ years.

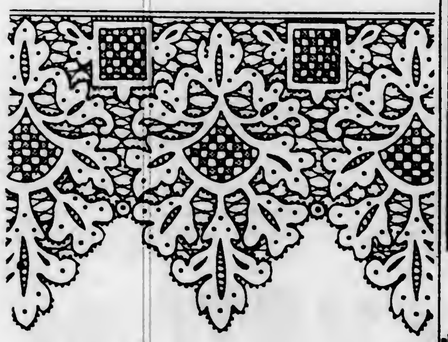


Claim.—The ornamental design for Levers lace as shown.

37,840. LEVERS LACE. CHARLES W. BIRKIN, Nottingham, England. Filed Jan. 16, 1906. Serial No. 296,427. Term of patent 3½ years.

Claim.—The ornamental design for Levers lace as shown.

37,841. LEVERS LACE. CHARLES W. BIRKIN, Nottingham, England. Filed Jan. 19, 1906. Serial No. 296,915. Term of patent 3½ years.



Claim.—The ornamental design for Levers lace as shown.

37,842. LEVERS LACE. CHARLES W. BIRKIN, Nottingham, England. Filed Jan. 20, 1906. Serial No. 297,079. Term of patent 3½ years.

Claim.—The ornamental design for Levers lace as shown.

37,843. PRINTED TEXTILE FABRIC. EDWARD B. VANDERGAW, Brooklyn, N. Y. Filed Dec. 26, 1905. Serial No. 292,681. Term of patent 7 years.

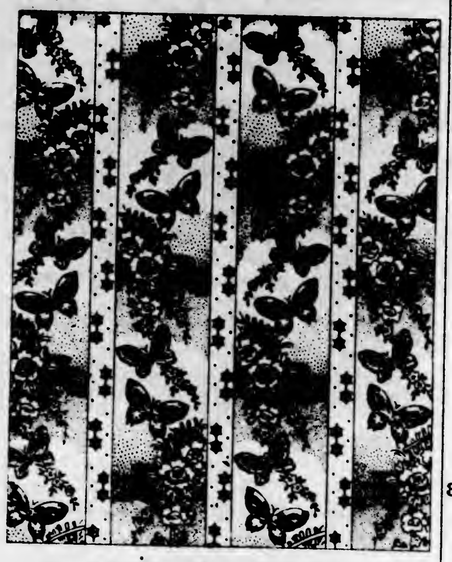
Claim.—The ornamental design for a printed textile fabric as shown.

37,844. PRINTED TEXTILE FABRIC. EDWARD B. VANDERGAW, Brooklyn, N. Y. Filed Dec. 26, 1905. Serial No. 292,682. Term of patent 7 years.

37,844.

37,846. RUG. ADOLPH PETZOLD, Philadelphia, Pa., assignor to John

37,844.



Claim.—The ornamental design for a printed textile fabric as shown.

37,845. RUG. ADOLPH PETZOLD, Philadelphia, Pa., assignor to John H. Bromley and Edward Bromley, Philadelphia, Pa., trading as John Bromley & Sons. Filed Dec. 18, 1905. Serial No. 292,880. Term of patent 3½ years.

Claim.—The ornamental design for a rug, as shown.

37,846. RUG. ADOLPH PETZOLD, Philadelphia, Pa., assignor to John H. Bromley and Edward Bromley, Philadelphia, Pa., trading as John Bromley & Sons. Filed Dec. 18, 1905. Serial No. 292,881. Term of patent 3½ years.

Claim.—The ornamental design for a rug, as shown.

37,847. RUG. ADOLPH PETZOLD, Philadelphia, Pa., assignor to John H. Bromley and Edward Bromley, Philadelphia, Pa., trading as John Bromley & Sons. Filed Dec. 18, 1905. Serial No. 292,882. Term of patent 3½ years.

Claim.—The ornamental design for a rug, as shown.

TRADE-MARKS

GRANTED FEBRUARY 20, 1906.

The following trade-marks have been adjudged entitled to registration under the act of February 20, 1905, and are published in compliance with section 6 of said act. Said section provides:

"Any person who believes he would be damaged by the registration of a mark may oppose the same by filing notice of opposition, stating the grounds therefor, in the Patent Office within thirty days after the publication of the mark sought to be registered, which said notice of opposition shall be verified by the person filing the same before one of the officers mentioned in section two of this act. If no notice of opposition is filed within said time the Commissioner shall issue a certificate of registration therefor, as hereinafter provided for."

Marks which are stated to have been "Used ten years" are registrable under the last proviso of section 5 of said act, which is as follows:

"And provided further, That nothing herein shall prevent the registration of any mark used by the applicant or his predecessors, or by those from whom title to the mark is derived, in commerce with foreign nations or among the several States, or with Indian tribes, which was in actual and exclusive use as a trade-mark of the applicant or his predecessors from whom he derived title for ten years next preceding the passage of this act."

Section 14 of said act provides for the following fee:

"On filing notice of opposition to the registration of a trade-mark, ten dollars."

SER. No. 154. WHISKY. CAHN, BELT & CO., Baltimore, Md. Filed Apr. 1, 1905.

MARYLAND CLUB

The words "MARYLAND CLUB."

SER. No. 279. SEWING-MACHINES. ALBERT G. MASON, Cleveland, Ohio. Filed Apr. 3, 1905.

NEW DEFENDER

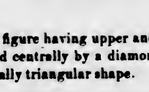
The words "NEW DEFENDER."

SER. No. 653. STOCK-FEED. RALSTON PURINA CO., St. Louis, Mo. Filed Apr. 6, 1905.

PROTENA

The word "PROTENA."

SER. No. 724. RULES, YARDSTICKS, BOARD-MEASURES, AND LOG-MEASURES. THE CHAPIN-STEPHENS COMPANY, Pine Meadow, Conn. Filed Apr. 7, 1905.



A rectangular figure having upper and lower panels, the upper panel being divided centrally by a diamond-shaped figure, and end panels of substantially triangular shape.

SER. No. 1,138. WHEAT-FLOUR, GRAHAM FLOUR, AND RYE-FLOUR. THE DIAMOND ELEVATOR & MILLING COMPANY, Minneapolis, Minn. Filed Apr. 11, 1905.

The word "CUT" appearing on a diamond-shaped figure printed in red.

SER. No. 1,176. ACID PHOSPHATE AND A SYRUP OF PHOSPHATES. THE CHAS. M. DOEBLER COMPANY, New York, N. Y.

SER. No. 1,561. PLAYING-CARDS. THE UNITED STATES PLAYING

The representation of a section of a wheel having thereupon the

SER. No. 2,441.

SER. No. 1,176. ACID PHOSPHATE AND A SYRUP OF PHOSPHATES. THE CHAS. H. PHELPS CHEMICAL CO., New York, N. Y. Filed Apr. 11, 1905. Used ten years.

A monogram containing the letters "PHILLIPS," said monogram being on a shield which is surrounded by a buckled strap.

SER. No. 1,242. GLYCERIN SOAP. MÜLHENS & KROPFF, New York, N. Y. Filed Apr. 12, 1905. Used ten years.

The representation of a cake of soap having on one face thereof two parallel bars or gutters having rounded ends.

SER. No. 1,279. PINE-WOOD OIL. SPIRITINE CHEMICAL COMPANY, Wilmington, N. C. Filed Apr. 12, 1905.

SPIRITINE

The word "SPIRITINE."

SER. No. 1,546. UPHOLSTERY TEXTILE FABRICS. ANDREW McLEAN CO., Passaic, N. J. Filed Apr. 14, 1905.

The figure of a knight on horseback waving aloft a standard, the figure resting upon an ornamental pedestal on which are inscribed the words "THE VICTOR."

SER. No. 1,561. PLAYING-CARDS. THE UNITED STATES PLAYING CARD CO., Cincinnati, Ohio. Filed Apr. 15, 1905.

The words "IVORY FINISH" and the letters and figures "No 808" arranged on an oblong panel.

SER. No. 1,589. PLAYING-CARDS. THE UNITED STATES PLAYING CARD CO., Cincinnati, Ohio. Filed Apr. 15, 1905.

AUTO

The word "AUTO."

SER. No. 1,592. PLAYING-CARDS. THE UNITED STATES PLAYING CARD CO., Cincinnati, Ohio. Filed Apr. 15, 1905.

SAFETY

The word "SAFETY."

SER. No. 1,717. LIQUID COMPOUNDS OF COD-LIVER OIL. NORWAY PHARMACAL COMPANY, New York, N. Y. Filed Apr. 15, 1905.

MORRHOLINE

The word "MORRHOLINE."

SER. No. 1,855. LEATHER AND RUBBER CEMENT. ECLIPSE CEMENT & BLACKING CO., Philadelphia, Pa. Filed Apr. 17, 1905.

The words "BULL DOG," and the representation of a bulldog in recumbent position, and an annular band, within which latter said representation is contained and on which said words are imposed.

SER. No. 1,988. GAS AND GASOLENE ENGINES. THE FAIRBANKS CO., New York, N. Y. Filed APR. 17, 1905.

The representation of a section of a wheel having thereupon the words "THE FAIRBANKS," the word "FAIRBANKS" being inclosed in quotation-marks, associated with the words and character "IMPROVED" and "GAS & GASOLENE ENGINES."

SER. No. 2,008. PACKAGE-ROLLS OF GOLD, SILVER, ALUMINUM, COMPOSITION, OR OTHER METAL LEAF. W. H. GEE MFG. CO., Providence, R. I. Filed Apr. 17, 1905. Used ten years.

The words "RIBBON LEAF."

SER. No. 2,104. BLACK PAINTS AND JAPANS. H. S. GRAVES CO., INC., Philadelphia, Pa. Filed Apr. 18, 1905. Used ten years.

OXFORD

The word "OXFORD."

SER. No. 2,294. PORTABLE BOWLING-ALLEYS. THE AMERICAN BOX BALL CO., Indianapolis, Ind. Filed Apr. 19, 1905.

THE AMERICAN BOX BALL ALLEY

The words "THE AMERICAN BOX BALL ALLEY."

SER. No. 2,416. METAL BARS, SHEETS, PLATES, HOOPS, BANDS, BILLETS, BLOOMS, SLABS, ANGLES, CHANNELS, I-BEAMS, S-BARS, TEES, INGOTS, AND PIGS. DELOREME, GILBERT & TOWER, INCORPORATED, New York, N. Y. Filed Apr. 20, 1905.

The word "DEAL" upon a square background colored red.

SER. No. 2,441. POWDERED DESSERT-JELLY PREPARATION. THE STERNS & SALADINE COMPANY, New York, N. Y. Filed Apr. 20, 1905.

BROMANGELON

The word "BROMANGELON."

SER. No. 2,480. REMEDY FOR THE CURE OR ALLEVIATION OF HEADACHES AND LIVER DISORDERS. JAMES G. BAKER, Fairfield, Ill. Filed Apr. 20, 1905.

YANKEE

The arbitrary word "YANKEE."

SER. No. 2,619. STOVES, RANGES, HEATERS, FURNACES, AND PARTS THEREOF. RICHARDSON & BOYNTON COMPANY, New York, N. Y. Filed Apr. 21, 1905. Used ten years.

PERFECT

The word "PERFECT."

SER. No. 2,630. MEN'S AND BOYS' PANTS. MALONE MANUFACTURING CO., Malone, N. Y. Filed Apr. 21, 1905.

The words "THE ADIRONDACK," associated with the representation of a mountain and lake scene, a tree having a bird upon a branch thereof being represented in the foreground and a stag standing near the base of said tree.

SER. No. 2,646. CHEWING AND SMOKING TOBACCO. ROBT. HARRIS & BRO., Reidsville, N. C. Filed Apr. 19, 1905.

The representation of a hatchet.

SER. No. 2,842. BISCUITS. F. B. WARREN & CO., Brockton, Mass. Filed Apr. 24, 1905.

SER. No. 3,842.

A representation of a tropical scene comprising more particularly a showing of cocoanut-palms and a camel with a human figure thereon in the foreground and pyramids in the background. To the right is a rectangular panel containing the representation of four open boxes, and to the right of this panel is a diamond-shaped panel or border on which appears the word "PREMIUM." The whole is inclosed in a rectangular border.

SER. No. 2,939. CIGARS. THE DIESEL-WEBNER CO., Lima, Ohio. Filed Apr. 24, 1905. Used ten years.

SAN FELICE

The words "SAN FELICE."

SER. No. 3,004. SILVER TABLEWARE, HOLLOW WARE, AND FLAT WARE. WOOSUNG STERLING COMPANY, New York, N. Y. Filed Apr. 26, 1905.

The letter "W," partially surrounded by a wreath.

SER. No. 3,191. LEATHER FOR SHOES, GLOVES, AND HARNESS. PFISTER & VOGEL LEATHER COMPANY, Milwaukee, Wis. Filed Apr. 26, 1905.

A monogram of the letters "P V" on a spray of hemlock and inclosed in a circular border.

SER. No. 3,446. RUGS, ART SQUARES, AND MATTING MADE OF GRASS TWINE. OSHKOSH GRASS MATTING CO., Oshkosh, Wis. Filed Apr. 26, 1905.

DELTOX

The word "DELTOX."

SER. No. 3,458. LIQUID PREPARATION FOR INTERNAL AND EXTERNAL APPLICATION. THE HERB MEDICINE COMPANY, Springfield, Ohio. Filed Apr. 26, 1905.

LIGHTNING
Hot Drops

The words "LIGHTNING HOT DROPS" and the pictorial representation of a harvest scene showing persons harvesting herbs upon a hillside with a pack-animal in the rear.

SER. No. 3,473. REMEDY FOR CHILLS AND FEVER AND AFFECTIONS RESULTING FROM MALARIA, LA GRIPPE, COLD, AND PNEUMONIA. THE EUCALINE MEDICINE CO., Dallas, Tex. Filed Apr. 28, 1905.

The representation of a leaf and a small portion of a branch upon which there are a flower and a seed-pod of the eucalyptus tree, the branch being within the curve of the leaf.

SER. No. 3,731. WHISKY. THE J. J. DOUGLAS CO., Louisville, Ky. Filed May 1, 1905. Used ten years.

The word "CARLTON" beneath a monogram of the letters "J J D Co" inside of a circle.

SER. No. 3,787. WHISKY. CORNING AND COMPANY, Peoria, Ill. Filed May 1, 1905. Used ten years.

SER. No. 3,787.

LEE NEWTON'S

The name "LEE NEWTON'S."

SER. No. 3,789. WHISKY. CORNING AND COMPANY, Peoria, Ill. Filed May 1, 1905. Used ten years.

Mt Pleasant

The words "MT PLEASANT."

SER. No. 3,751. SHOT GUN SHELLS. THE AUSTIN CARTRIDGE CO., Cleveland, Ohio. Filed May 1, 1905.

CRACK SHOT

The words "CRACK SHOT."

SER. No. 4,014. TURKEY-RED OIL AND SOLUBLE GREASE AS USED FOR DYEING, LUBRICATING, FINISHING, AND SOFTENING PURPOSES. THE ARABOL M'F'G CO., New York, N. Y. Filed May 2, 1906.

The pictorial representation of an Egyptian sphinx mounted on a pedestal.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

EX PARTE WURTZ.

Decided December 22, 1905.

1. ASSIGNMENT—IDENTIFICATION BY DATE OF EXECUTION OF APPLICATION.

An assignment does not identify an application with certainty where it alleges that such application was executed November 9, 1904, but the notary's certificate attached to the application bears the date of November 9, 1890.

2. SAME—IDENTIFICATION OF INVENTION BY REFERENCE TO CAVEAT.

An assignment executed by an inventor transferring his entire interest in certain inventions disclosed in a caveat filed in the Patent Office, identifying such caveat by date of filing and subject-matter, and requesting that the patent upon the application "which I am about to make" issue to the assignee, identifies an application subsequently filed sufficiently to warrant its recognition by the Office where it is found that the subject-matter of the caveat corresponds to that of the application.

3. SAME—PRACTICE ANALOGOUS TO THAT APPLIED TO DIVISIONAL APPLICATIONS.

It is the uniform custom of the Office to apply to divisional applications assignments of the original cases, and no good reason is seen why the same practice should not be applied to caveats and subsequent applicatons for the same subject-matter.

4. SAME—TWO ASSIGNMENTS OF SAME INVENTOR—FIRST ASSIGNEE RECOGNIZED.

Where an inventor assigns his entire invention to another, identifying the invention by reference to a caveat filed in the Patent Office, and requests that the patent which may be issued on an application which he is "about to make" be issued to the assignee, and subsequently makes another assignment of the same invention similar to the first, except that he identifies the invention by referring to the date of execution of the application, the first assignee is entitled to prosecute the application and receive the patent, as the first assignment, as well as the second, conveys the legal title.

ON PETITION.

PROCESS OF DISTILLING COALS AND OTHER HYDROCARBONACEOUS SUBSTANCES

Mr. W. C. Dona for the applicant.

ALLEN, *Commissioner:*

This is a petition by The American Chemical Eduction Company that it be recognized as the assignee of the inventor in the above-entitled case and that it be permitted to prosecute the application as the owner.

On May 21, 1904, there was recorded in this Office (Liber K 69, p. 488) an instrument dated June 11, 1903, and signed by the applicant Wurtz, transferring to the petitioner his entire interest in certain inventions disclosed in caveats filed in this Office. The caveat was identified by date of filing, the subject-matter was stated, and it was specifically requested that the patent upon the application "which I am about to make" issue to the present petitioner as assignee.

The present application was filed November 21, 1904, and it appears that the subject-matter thereof corresponds to that of the caveat identified in the assignment. The petitioner therefore contends that it is the owner of the present application and is entitled to receive the patent.

It appears, however, from the records of this Office (Liber V 72, pp. 76–80) that the inventor Wurtz executed an assignment to one Smith on November 9, 1904. Smith assigned to Fitzgerald, and Fitzgerald to The American Eduction Company. That company opposes the present petition and alleges that it is the legal owner of the applications and inventions acquired through Smith and Fitzgerald.

The assignment to Smith, dated November 9, 1904, is substantially like that to the petitioner, dated June 11, 1903. The assignment to the petitioner identified the invention by reference to the caveat, whereas the later assignment to Smith identifies it by the date of execution of an application for patent. That date of execution is said to be November 9, 1904. It is contended in opposition to the petition that the assignment of November 9, 1904, identifies the present application and conveys legal title, whereas the assignment to the petitioner does not identify the application and conveys nothing save an equitable right. It is therefore urged that the petitioner is not the legal owner and is not entitled to receive the patent.

I am clearly of the opinion that the identification of the caveat, coupled with the statement that "I am about to make application," is a sufficient identification of the present application to warrent action by this Office. It is the uniform custom of the Office to apply to divisional applications assignments of the original cases, and no good reason is seen why the same practice should not be applied to caveats and subsequent applications for the subject-matter thereof. All that is necessary is certainty of identification.

The assignment made to this petitioner conveys the legal title, and since it was prior in point of time to any other alleged transfer by the inventor it must be recognized as giving the petitioner the right to prosecute the application and receive the patent.

While the matter of dates is controlling upon the question which assignment shall be recognized, it is to be noted that the assignment of November 9, 1904, does not identify the present application with certainty. It says the date of execution of the application is November 9, 1904, whereas the certificate of the notary attached to the application bears date "this ninth day of November, eighteen hundred and ninety."

The petition is granted.

TURNBULL v. CURTIS.

Decided December 28, 1905.

1. INTERFERENCE—EVIDENCE—TESTIMONY OF ASSIGNEE.

Where a party depends for corroboration of his claims of conception and disclosure of the invention upon the testimony of his assignee and the character for veracity and the reliability of the assignee are unimpeached and the circumstances afford no reason for disbelieving the statements in the deposition of the assignee, *Held* that the corroboration is not rendered insufficient by the fact that the witness is the party's assignee.

2. SAME—SAME—FAILURE TO CALL A WITNESS.

Where party claimed to have disclosed his invention to his solicitor, among others, and the solicitor was not put upon the stand, but it appears that the party was not certain of disclosure to the solicitor at the early date upon which disclosure was made to another witness who did testify, *Held* that the failure to call the solicitor as a witness was of no consequence.

3. SAME—SAME—NON-PRODUCTION OF SKETCHES.

Where sketches claimed to have been made by the inventor were not produced, but the inventor testified that the sketches were not made for preservation and were, in fact, not preserved, *Held* that no unfavorable inference should be drawn from their non-production.

4. SAME—PRIORITY—DILIGENCE—POVERTY—ENLISTING AID OR FILING APPLICATION.

The conceiver of an invention whose financial condition is such as to excuse him from any attempt unaided to actually reduce the invention to practice must, if he would hold the field, enlist the aid of others in actual reduction to practice or file an application for patent.

5. SAME—SAME—SAME—SAME—COMMERCIAL EXPLOITATION.

Where a party was in straitened financial condition, but his efforts during the period of delay in reducing to practice were directed toward commercial exploitation of his inventions generally, rather than toward securing the construction of the machine in issue or toward filing an application for patent thereon, *Held* that he was not reasonably diligent.

6. SAME—SAME—SAME—SAME—FILING APPLICATION.

The contention that a party could not file his application earlier than he did is rebutted by the fact that he filed or caused to be filed subsequent to his conception of the invention in issue and prior to the filing of his application in interference applications for patents upon six other inventions.

7. SAME—SAME—SAME—SAME—INVENTION AN ASSET.

It is to be presumed that an invention which is contested in interference proceedings is a valuable asset and that an inventor if without other means can ordinarily draw on this source, at least for means wherewith to file his application. If he fails to do so, he must show that the failure was unavoidable and after every reasonable effort in that direction had been exerted.

8. SAME—SAME—SAME—DELAY IN FAVOR OF RELATED INVENTION—EVIDENCE.

In order to bring his case within the doctrine of those cases where inventors were considered diligent who postponed the completion of their inventions in order to complete other devices intimately connected therewith, a party must produce evidence that his invention is not useful except in connection with the devices in whose favor the delay was made. Failing to do so, his opponent is relieved from the duty of producing evidence to the contrary, and the party cannot thereafter rely upon the absence of such evidence to the contrary to support the contention that the invention was not otherwise useful.

APPEAL from Examiners-in-Chief.

METAL CUTTING AND FORMING MACHINES.

Mr. Charles W. Hills and *Messrs. Bacon & Milans* for Turnbull.

Messrs. Munday, Evarts & Adcock and *Mr. H. N. Low* for Curtis.

ALLEN, *Commissioner:*

This is an appeal by Turnbull from that portion of the decision of the Examiners-in-Chief which affirms as to counts 2, 3, 4, and 5 the decision of the Examiner of Interferences awarding priority of invention to Curtis upon an issue expressed in the following counts:

1. In a machine of the class described, a plurality of pairs of cutting-rolls and coacting, independently-removable means on each pair of cutting-rolls adapted to slit a sheet of metal into a plurality of relatively short slits, the knives on each pair of said rolls forming slits alternating with those formed by the knives on the other pair.

2. In a machine of the class described, the combination with a frame, of a plurality of pairs of coacting rolls journaled thereon, means arranged on said rolls equidistant apart and adapted to cut a sheet of metal into a plurality of short slits arranged staggering with each other and a uniform distance apart, each of said pairs of rolls forming half of said slits.

3. The sheet-metal-slitting machine wherein are combined two pairs of slitting-rolls arranged one in advance of the other, said rolls being adapted to slit the sheet without bending the metal, and each roll being provided with a series of cutters extending the entire width of the sheet, and each pair of rolls forming slits in rows alternating with the slits formed by the cutters of the other pair.

4. The sheet-metal-slitting machine wherein are combined two pairs of slitting-rolls, one pair in advance of the other pair, and both provided with notched cutters extending the entire width of the sheet, and so arranged that the rows of slits formed by one pair alternate with the rows formed by the other pair, and so the slits in the different rows break joints, said cutters being also adapted to slit the sheet without bending the metal.

5. The sheet-metal-slitting machine wherein are combined two pairs of slitting-rolls arranged one pair in advance of the other, and both provided with notched cutters whose thickness equals the width of two strands of the slitted sheet, said cutters being arranged so the rows of slits cut by one pair of rolls alternate with the rows of slits cut by the other pair, and being adapted to cut the sheet without bending the metal.

The Examiners-in-Chief reversed the decision of the Examiner of Interferences as to count 1 and awarded priority thereon to Turnbull. They also called attention to the fact that in their opinion Curtis has no right to make a claim corresponding to this count. As Curtis has taken no appeal from the decision on priority adverse to him upon count 1, it is not necessary to consider further the question of his right to make a claim corresponding thereto.

Taking up the question of priority upon counts 2, 3, 4, and 5, it is found that Turnbull in his preliminary statement claims conception and disclosure of the invention in the year 1897. He reduced to practice constructively on February 15, 1902, by filing an application for patent, of which his application in interference is a continuation. Curtis claims conception in October of 1900, and his date of reduction to practice is September 23, 1901, also constructive through the filing of his application in interference. The Examiner of Interferences found that Turnbull's conception in 1897, or thereabout, was proved and that Curtis had proved conception in the year 1900, some time during the months of October, November, or December. He also found that Turnbull was not diligent in his reduction to practice and awarded priority of invention to Curtis. The Examiners-in-Chief expressed the same conclusion as the Examiner of Interferences on each of these points so far as counts 2, 3, 4, and 5 are concerned. No question is raised here as to the date of conception by Turnbull or of the date of reduction to practice by either party.

The questions which are raised by this appeal are two, and are, first, as to Curtis's date of conception, and, second, as to Turnbull's diligence. Turnbull contends that Curtis has failed to prove his alleged conception of the invention in October or December of 1900 or conception by him at any time prior to the filing of his application on September 23, 1901. The question of Curtis's date of conception is of consequence as marking the beginning of the period throughout which Turnbull must have been diligent if he is to prevail here. Curtis testified that he conceived the invention about October 15, 1900, and that he disclosed it verbally and by sketches to one Bradford and, he thinks, to Evarts, his patent solicitor. (C. R., p. 5, Qs. 6–8.) He identifies the invention (Qs. 13–19) and fixes the time of

invention as before a severe illness suffered during the first three months of 1901. (Qs. 10–12.) Bradford corroborates Curtis as to disclosure to him in the fall of 1900. (C. R., pp. 3 and 4, Q. 5.) I am asked to disregard this evidence on the grounds that Bradford is interested in the invention as an assignee; that Bradford does not identify the invention disclosed to him as the complete invention in issue; that the solicitor, Evarts, did not testify, and that the sketches which Curtis referred to have not been produced. The testimony of an assignee is competent. In the present case the character for veracity and the reliability of the assignee are unimpeached, and the circumstances afford no reason for disbelieving the statements in his deposition. I am of the opinion that he fully identifies the invention disclosed to him in the fall of 1900 as the invention in issue. (C. R., pp. 3 and 4, Qs. 5 to 8.) The failure to put the solicitor, Evarts, on the stand is of no consequence, as it does not appear that Curtis was certain of disclosure to him at the early date upon which disclosure was made to Bradford. As to the non-production of the sketches, Curtis testified that these were not made for preservation and were, in fact, not preserved. I do not perceive why, in view of the explanation, any unfavorable inference should be made as to Curtis's conception from their absence. Curtis seems to have been content to rest for proof of conception upon a minimum of evidence; but that minimum seems to be sufficient to satisfy the requirements of this case.

Having determined that Curtis conceived and disclosed the invention in 1900, some time between October 15 and the end of December, it becomes necessary to determine whether Turnbull at this time was exercising reasonable diligence in the reduction of the invention to practice. It appears that the preparation of drawings for Turnbull's application for patent was mentioned to the draftsman some time between May and August, 1901, but that the draftsman was told to take his time and not to hurry, as there was no prospect of money forthcoming to pay for the work. Whether this act and the subsequent acts leading to the filing of Turnbull's case amounted to reasonable diligence need not be determined, since Turnbull was not prior to this date diligently engaged in the reduction of the invention to practice.

On the question of diligence Turnbull testifies at some length to the effect that from a time previous to the conception of the present invention and to the filing of his application he was in a very straitened financial condition, a man who had been through bankruptcy, who was pressed with debts accruing from business failures and from the support of himself and family, and who was practically without income except small salaries received during portions of the time and a cash sum of $2,000 received on December 7, 1900, upon the sale of one of his inventions. He is corroborated as to debts and lack of income by his son, and other witnesses testify that he was a poor man. It may be accepted that Turnbull's financial condition was such as to excuse him from any attempt unaided to build a machine. In such a case, however, it is incumbent on the conceiver of an invention who would hold the field to enlist the aid of others in actual reduction to practice or to file an application for patent. Turnbull contends that he was too poor to file an application, but that he was endeavoring throughout the period of delay to interest others in the development of his inventions and in the protection of the same by patents. His son testifies that Turnbull frequently tried to borrow money from him in the years 1899 and 1900 wherewith to file an application upon this invention. (T. R., pp. 77 and 78, X-Qs. 4–8.) The witness Glendening testifies that Turnbull discussed with him the building of a machine embodying the present invention in July, 1900, or earlier. (T. R., pp. 85–87, Qs. 4–15.) It appears that the contract for building the machine was given to Glendening in 1901 and that the machine was actually built thereunder and successfully operated. (T. R., p. 88, Qs. 18–20.) The witness McLauchlan testifies that Turnbull's machines were seriously considered by capitalists about a year and a half after the date June 8, 1899, and that up to the time when the arrangements were made for filing the application and building the machine Turnbull continued to urge him to interest himself in the machine and was constantly talking about it and soliciting financial aid and coöperation. (T. R., p. 12, Qs. 20–23.) Correspondence is also in evidence to show that Turnbull was endeavoring to get manufacturers to take up his inventions, build his machines, and join with him in the exploitation of the product. (Turnbull's exhibits, Correspondence Bostwick Co., and Letter to Cochrane, August 24, 1900.)

The above is in substance all the evidence favorable to the contention that Turnbull was diligently seeking reduction to practice of the invention in issue prior to the year 1901. It is in my opinion overcome by evidence that Turnbull might have filed his application before Curtis entered the field and that his efforts at that time were directed rather toward the commercial exploitation of his inventions generally than toward securing the construction of the machine in issue or toward the filing of an application for patent thereon. On December 7, 1900, he sold a patent for $2,000. (T. R., pp. 48 and 49, X-Qs. 56–57.) He received this amount, and though in debt and without immediate prospects of further income it does not appear that he could not have spared enough of this money to pay for an application for patent had he cared to do so. The contention that Turnbull could not file his application earlier than he did is rebutted by the fact that he filed or caused to be filed subsequent to his conception of the present invention and prior to the filing of his application applications upon six other inventions upon which patents issued, as follows:

	Issued.	Application filed.
No. 601,620	March 29, 1898	March 1, 1897
No. 609,481	August 23, 1898	February 11, 1898
No. 628,565	July 11, 1899	August 13, 1898
No. 642,056	January 23, 1900	March 24, 1899
No. 664,193	December 18, 1900	July 23, 1900
No. 681,355	August 27, 1901	December 26, 1900

It would seem that Turnbull could have interpolated the present application in this list or could have substituted it for one of these applications, so as to have obtained a constructive reduction to practice before the entry of Curtis into the field, had he cared to do so. Statements of Turnbull on cross-examination confirm the presumption that Turnbull's failure to secure an earlier construction of his machine and his failure to file an application thereon prior to the filing of the present application was due to a desire to withhold the invention from others until the opportunity should arrive for satisfactory commercial development

thereof. The testimony referred to is as follows, (T. R., pp. 57 and 58:)

to the postponed device. The Turnbull Patent No. 664,193

The issue is defined as follows:

thereof. The testimony referred to is as follows, (T. R., pp. 57 and 58:)

X-Q. 66. Why did you delay your efforts to bring out your inventions relating to expanded metal and push those upon your other inventions instead?

A. One reason was the lack of funds. I knew that it would take considerable more money to get out patents of that size than it would on patents of minor magnitude. I believe that the inventions of making metal lath by the rolling process was a complete and wonderful revolution of the lath industry. Another reason would be that I was looking for the right man. I had been bitten several times by getting hold of the wrong man and frozen out.

X-Q. 77. You found means wherewith to pay for these six patents. Do you wish to be understood as saying that you could not find the means during the time lapsing between the conception of this invention and the 23d of September, 1901, to pay for one more application.

A. I wish to be understood, if possible, as endeavoring to get some big whole-souled, honest business man to put up enough money to float a device which would be a complete revolution of the lath industry, meaning enormous profits, at least seventy-five thousand dollars to a hundred thousand dollars profit per annum on each machine. That man I had been unable to find in the time stated.

X-Q. 88. Question repeated.

A. Not in the way I wanted it. I was trying to raise money or get money out of some of these minor patents whereby I could apply for patents on this metal-lath industry whereby I could retain the control of it. No, sir, I could not find the means if I had taken any of the parties in on the expanded-metal deal and given them a half interest ft would likely have swamped the whole thing. I was looking for a man of large caliber.

"Seeking for the right man," "some big whole-souled" man who would "put up money enough to float" the invention for "enormous profits," and endeavoring to "retain the control" himself for fear that taking others in would have "swamped the whole thing" shows that the delay was voluntary and for reasons which will not excuse the failure to make an earlier reduction. The Turnbull correspondence in evidence leads to the same conclusion.

It is to be presumed that an invention which is contested in interference proceedings represents a valuable asset. An inventor if without other means can ordinarily draw on this source, at least for means wherewith to file his application. If he fails to do so, he must show that the failure was unavoidable and after every reasonable effort in that direction had been exerted. The independent conceiver who is first to reduce to practice cannot be excluded from the right to his invention by a party who though prior in conception delays his reduction in order that he may make what he may consider the most desirable commercial arrangements regarding the invention. Turnbull's patents on other inventions, his testimony quoted herein, and his exhibits of correspondence above referred to show that he was withholding this application until he could make an advantageous disposition thereof from a business point of view. He was not diligent, and his lack of diligence is not excusable. (*Wyman* v. *Donnelly*, 104 O. G., 310; *Paul* v. *Hess*, 115 O. G., 251.)

It is urged that filing the application for Turnbull's Patent No. 664,193 on July 23, 1900, prosecution, and taking out the patent on December 18, 1900, showed diligence in the reduction to practice of the present invention or excused lack of diligence thereon under the doctrine of certain exceptional cases where an inventor was considered diligent who postponed the completion of his invention in order to complete another device intimately connected therewith. (*Christensen* v. *Ellis*, 94 O. G., 2561; *McCormick* v. *Cleal*, 83 O. G., 1514.) The circumstances of the present case do not bring it under this doctrine, but rather under that of *Stapleton* v. *Kinney*, (96 O. G., 1432,) in which the court refused to hold work upon a favored invention diligence upon a postponed invention where—

> there were other methods and devices in operation * * * which, though crude and cumbersome, had nevertheless proved sufficient to extend the use of and give commercial value—

to the postponed device. The Turnbull Patent No. 664,193, issued December 18, 1900, whose prosecution is urged in excuse of the delay in this case, discloses and claims devices for cutting sheet metal and devices for expanding the same to form the finished expanded-metal lathing shown in Turnbull's Patent No. 642,056, issued January 23, 1900. The present invention is a modification of the cutting device shown in Patent No. 664,193. If there were practicable devices or means for expanding the cut metal adapted to complete the work of the machine in issue known during the period of delay upon the present case, then, under *Stapleton* v. *Kinney*, *supra*, the prosecution of Patent No. 664,193 is no excuse for the delay in the present case. I find no satisfactory evidence that such expanding devices were not known. On the contrary, Turnbull's Patent No. 664,193 refers to prior manufacture of expanded-metal lathing. (Page 1, lines 13 to 24.) Moreover, Patent No. 671,915, of April 9, 1901, for which application was filed October 13, 1900, (referred to in Curtis's application in interference,) and Patents No. 619,340, dated February 14, 1899, to Pitkin, No. 670,606, dated March 26, 1901, (application filed October 13, 1900,) to Curtis, and No. 642,056, January 23, 1900, (application filed March 24, 1899,) to Turnbull, (Turnbull exhibits,) indicate that slitting and cutting devices were known to be useful prior to the appearance of the expanding devices disclosed in Turnbull's Patent No. 664,193. Moreover, Turnbull states in the specification of his application in interference (p. 8) that obviously while he has described the invention as adapted for use for expanded-metal machines the same may be useful and desirable for many other purposes. However this may be, it was incumbent upon the appellant to produce evidence making a *prima facie* case that the present machine was not useful except in connection with the expanding mechanism of Patent No. 664,193 if he expected to rely upon the contention now under consideration. He failed to do this, and thereby relieved his opponent from the duty of producing evidence to the contrary. He cannot now avail himself of the absence of evidence to the contrary to support the contention that the invention in issue was not useful with expanding-machines known before the expanding-machine of Patent No. 664,193 or that it was not originally useful in other relations than with expanding-machines.

The decision of the Examiners-in-Chief affirming the decision of the Examiner of Interferences awarding priority of invention to Curtis as to counts 2, 3, 4, and 5 of the issue is affirmed.

W. H. JONES & CO. *v.* CARLTON IMPORTATION COMPANY.

Decided December 29, 1905.

TRADE-MARK INTERFERENCE—"OLD JAY" AND "BLUE JAY."

There is such a close resemblance between a mark consisting of the words "Old J" or "Old Jay Rye" in connection with a representation of a blue jay and the words "Blue Jay" as to cause confusion and bring about a conflict of rights.

APPEAL on motion.

TRADE-MARK FOR WHISKY.

Mr. A. E. Wallace for Jones & Co.

Mr. Frederic B. Keefer for Carlton Importation Company.

ALLEN, *Commissioner:*

This is an appeal by Carlton Importation Company from the decision of the Examiner of Trade-Marks denying its motion for dissolution of the interference.

The issue is defined as follows:

The words "Blue Jay," or "Old Jay," for whisky.

The appellant uses the words "Old J" or "Old Jay Rye" in connection with the representation of a blue jay, whereas Jones & Co. use the words "Blue Jay." Both marks as used include other elements; but, as pointed out by the Examiner, the idea embodied in both which will attract attention is that of the bird known as a jay.

I am satisfied that there is such close resemblance between the marks as to cause confusion and bring about a conflict of rights. The Examiner was right in refusing to dissolve the interference, and his decision is affirmed.

KOLB *v.* HEMINGWAY *v.* CURTIS.

Decided January 3, 1906.

INTERFERENCE IN FACT—GENERIC ISSUE.

There maybe an interference in fact on a generic issue based on two devices which are specifically different.

APPEAL on motion.

ELASTIC-FLUID TURBINE.

Messrs. Foster, Freeman & Watson for Kolb.

Mr. Charles B. Hemingway pro se.

Messrs. Dyer & Dyer for Curtis.

ALLEN, *Commissioner:*

This is an appeal by Hemingway from a decision of the Primary Examiner holding that there is an interference in fact.

Appellant urges that in order to decide the question presented a comparison of the interfering constructions should first be made to determine whether or not they are identical, and if they are not identical, then there is no interference in fact without regard to the terms of the issue. The brief filed in support of the appeal is largely given up to a discussion of the differences between the two constructions which are not specified in the claim. This line of argument indicates a misconception by appellant of the precise nature of the question presented. It is well settled that an interference may exist on a broad issue based on structures which are specifically different. This is made clear by numerous decisions recently rendered. In this connection attention is directed to the recent decision of *Townsend* v. *Copeland* v. *Robinson*, (119 O. G., 2523,) which clearly explains what will be considered as a question of interference in fact

The only question which seems to be properly presented by this appeal is whether or not both parties have a construction responding to the words of the issue, "return bend." It is found that they have. While the respective constructions referred to by those words are specifically different, as is often the case, the functions are substantially the same, and the words are broad enough to cover both constructions in the same sense. The claims cannot be construed to mean anything except what their terms indicate. If appellant desires to limit his claims to specific details which are not found in the application of the opposing party, such claims will undoubtedly be allowed to appellant, if they are patentable over the issue, after the termination of the interference, and if appellant does not desire to contest the question of priority as to the broad subject-matter the interference may be terminated without a contest, as provided by the rules.

The decision of the Primary Examiner is affirmed.

FELSING *v.* NELSON.

Decided January 13, 1906.

PRIOR EX PARTE DECISION BY APPELLATE TRIBUNAL—NOT BINDING ON PRIMARY EXAMINER ON INTER PARTES CONSIDERATION.

An *ex parte* decision on the question of new matter in a reissue application is not absolutely binding on the Primary Examiner when the question is raised *inter partes* on a motion to dissolve; but it should be persuasive. If the *inter partes* consideration of the case does not bring out new reasons or new phases of the old reasons or such new light as would reasonably tend to change the decision by the appellate tribunal, then such decision should be followed.

ON PETITION.

PNEUMATIC STRAW-STACKER.

Messrs. Bradford & Hood and *Mr. E. W. Bradford* for Felsing.

Mr. E. G. Siggers for Nelson.

ALLEN, *Commissioner:*

This is a petition by Nelson requesting that the Primary Examiner be instructed that an *ex parte* decision of the Examiners-in-Chief on the question of new matter in a reissue application is not binding upon him when the question is presented on a motion to dissolve and that he should render an independent judgment thereon.

The application of the opposing party, Felsing, is a reissue application. Prior to the declaration of this interference the claims forming the counts of this issue were copied by Felsing from petitioner's patent, but were rejected by the Primary Examiner on the ground that they were not warranted by the original disclosure. Thereupon an appeal was taken to the Examiners-in-Chief, who reversed the decision of the Examiner, holding that such claims were warranted by the original disclosure. An interference was then declared between petitioner's patent and Felsing's reissue application.

Nelson brought a motion to dissolve, alleging irregularity in the declaration of the interference and that Felsing had no right to make the claims, because they were not warranted by his original disclosure. From the decision of the Primary Examiner rendered on this motion it appears that he felt bound by the prior *ex parte* judgment of the Examiners-in-Chief on the question presented and did not give his independent judgment thereon; hence this petition.

Practically the same state of facts here presented were present in the case of *Painter* v. *Hall*, (80 O. G., 1124; C. D., 1897, 43.) In that case certain claims had been allowed to Painter by the Examiners-in-Chief on appeal in a reissue application. An interference was afterward declared including said claims, and a motion to dissolve was brought, alleging, among other things, that Painter had no right to make said claims. The Primary Examiner held that the claims were not patentable, basing his decision on the same references over which the Examiners-in-Chief had allowed such claims on the *ex parte* appeal. It was contended by the opposing party that the previous judgment of the Examiners-in-Chief was controlling as a matter of law upon the Examiner as well as upon the parties to the interference; but it was held that the Examiner's action was proper. That decision is, in part, as follows:

> It is true that the references on which the Examiner based his decision dissolving the interference were before him and the Examiners-in-Chief in the *ex parte* treatment of Painter's case; but in an *inter partes* case the Examiner is not precluded by the decision of the Examiners-in-Chief, although said decision should be very persuasive, though not conclusive. To hold otherwise would be to deprive a party of his rights and benefits under Rule 47 (old Rule 122)—in effect, to annul said rule. This rule provides for motions to dissolve an interference on the ground of non-patentability, although this question has been favorably decided in an *ex parte* proceeding either by the Examiner or by one of the appellate tribunals. On a motion to dissolve the question is considered and decided *de novo inter partes*. If the decision of the Primary Examiner is adverse to patentability, Rule 67 provides for an appeal *inter partes*. While the question of patentability may be decided favorably when it is considered *ex parte*, yet on an *inter partes* hearing it may be shown to the satisfaction of the tribunal that the decision was erroneous, and it would be reversed.
>
> The question of patentability decided *ex parte* cannot, therefore, be said to be *res adjudicata* when raised *inter partes*. To make the matter *res adjudicata* there must be concurrence of four conditions—identity in the thing sued for, of a cause of action, of the parties to the action, and of the quality in the persons. In the matter under consideration the identity of parties is lacking.

The practice indicated in the decision from which the above language is quoted is believed to be good practice and should be followed. The Primary Examiner in considering a question *inter partes* should not feel absolutely bound by a decision of the Examiners-in-Chief rendered on an *ex parte* hearing. On the other hand, their decision is not to be ignored. It should be persuasive, but not controlling. All reasons urged before the Primary Examiner should be considered by him in connection with the decision of the Examiners-in-Chief, and if there seems to be no reasonable ground for thinking that the decision of the Examiners-in-Chief might be different on an *inter partes* appeal, then their decision should be followed. In other words, if the *inter partes* consideration of the case does not bring out new reasons or new phases of the old reasons or such new light as would reasonably tend to change the prior decision, then such prior decision of the higher tribunal should be followed. But the distinction between a refusal to consider a question because of a prior decision and the consideration of that question and the decision thereof upon reasons stated in such prior decision should be always borne in mind. There should be no refusal to consider, but a consideration should be given and the decision based upon the reasons formerly given, if it is thought that they were correct.

The Primary Examiner is therefore directed to render a supplemental decision in conformity with the views above expressed.

EX PARTE CHAPMAN.

Decided January 22, 1906.

1. CLAIMS—MULTIPLICATION OF—REQUIREMENT TO ELIMINATE APPEALABLE TO EXAMINERS-IN-CHIEF.
   The requirement to eliminate certain claims because they are substantially the same as other claims in the same case is to be regarded as a rejection and is appealable to the Examiners-in-Chief.
2. SAME—MULTIPLICATION OF CLAIMS NOT PERMITTED—EFFECT ON PATENT.
   The multiplication of claims is not to be permitted, since it tends to impose a needless burden upon the Office in the examination of the application, and a patent including them would tend to deceive and confuse the public. Moreover, it may lead to a strict construction of the patent, and it may in some cases render the patent void.
3. SAME—THE WORDS "PARTIALLY SATURATED" OBJECTIONABLE.
   A claim for "lumber partially saturated with sulfuric acid" *Held* to be objectionable, the words "partially saturated" being inapt.

ON PETITION.

WOOD PRODUCTS.

Messrs. Mason, Fenwick & Lawrence for the applicant.

ALLEN, *Commissioner:*

This is a petition from a decision of the Primary Examiner objecting to the form of certain claims and holding that the claims are unnecessarily multiplied and also asking that the Examiner be directed to forthwith give final action on the merits of the claims.

The application contains twenty-six claims. The Examiner arranged certain of these claims into six groups, each group containing from two to six claims, and required that all but one claim in each group should be canceled. As a matter of language, no two claims are the same; but the Examiner regards those in the same group as stating the same invention in different words. He finds no substantial difference between them either in subject-matter or scope. In other words, he is of the opinion that the applicant has needlessly multiplied the claims by restatements in different phraseology of the same thing. Such multiplication of claims imposes a needless burden upon this Office in the examination of the application, and to issue a patent including them would deceive and confuse the public as to the scope of the patent.

The courts have frequently condemned the practice of needlessly multiplying claims. In *The Brush Electric Company* v. *The Electrical Accumulator Company* (56 O. G., 1334) it was said:

> What he actually did is the test by which his patents must be judged. He is entitled to what he invented and only this. His patents can receive no broader construction because he described his inventions with irksome prolixity and gives to the same structure a wearisome variety of names. The nomenclaturist should not seek the reward for his labors in the Patent Office. A person is not entitled to a patent because he has invented a new word. The danger and impropriety of holding a number of claims relating to the same structure, and which can be differentiated only by the most abstruse and metaphysical distinctions, seem apparent. They are calculated to embarrass the inventor and mislead the public.

In *Thomson-Houston Electric Company* v. *Elmira and Horseheads Railway Company* (74 O. G., 144) it was said:

> * * * he has obscured his real invention in a multitude of fulginous and attenuated claims, many of which can only be distinguished when their language is subjected to the most searching analysis. He has particularly pointed out his invention in the description; but, because of this seemingly needless verbosity, he has claimed it indistinctly, to the annoyance of the public, and especially that part of the public which is called upon to construe the patent.

In *Computing Scale Company* v. *Automatic Scale Company* (119 O. G., 1586) the court of appeals of this district said:

> Claims 7 and 8 admittedly do not differ patentably from claim 6, these three claims stating in varying phraseology the same invention—one of the many examples of word-painting too often found in Letters Patent.

See also the decisions of the same court in the cases of *Carpenter* (112 O. G., 503) and *Thomson*, decided at the present term.

The applicant himself gains no advantage by a needless multiplicity of claims; but, on the contrary, it may lead to a limited and strict construction of his claims. As said in *Thomson-Houston Company* v. *Elmira Company, supra:*

> Where the patentee has taken pains to cover every shadow of a shade in his claims, the range of construction is limited and he must be held strictly to language which he has adopted with such painstaking deliberation and exactness.

Not only may a needless multiplication of claims lead to a strict construction thereof, but it may in some cases render the patent void. In *Carlton* v. *Bokee* (17 Wall., 463) the United States Supreme Court said:

> Without deciding that a repetition of substantially the same claim in different words will vitiate a patent, we hold that where a specification by ambiguity and a needless multiplication of nebulous claims is calculated to deceive and mislead the public, the patent is void.

It is clearly the duty of this Office to see that patents do not issue with claims so multiplied as to embarrass and confuse the public. It should allow sufficient claims to amply protect the real invention, but should not permit needless repetition.

While the general principles which are controlling are clear, the application of them to a particular case involves a construction of the claims and a determination of their scope and meaning. It is to be presumed that the applicant insists upon all the claims because, in his opinion, they are substantially different and are necessary to adequately protect his real invention, and therefore to require the elimination of a part of them is to compel him to relinquish what he regards as a part of the protection to which he is entitled. Under the principles announced in *U. S., ex rel. Steinmetz*, v. *Allen* (192 U. S., 543) he is entitled to a review of a decision adverse to his right by the several appellate tribunals mentioned in the statutes. The requirement for the elimination of a part of the claims because of needless duplication is to be regarded as a rejection for the same reasons that a requirement for division is a rejection. This applicant's remedy, therefore, is an appeal to the Examiners-in-Chief and not an interlocutory petition.

The claims have also been held objectionable by the Examiner because of the use therein of the words "partially saturated" in the phrase "lumber partially saturated with sulfuric acid." These words do not seem to aptly describe the condition of the finished product, and objection to them was therefore properly made. At the hearing the word "impregnated" was suggested in lieu of the words "partially saturated." Petitioner expressed willingness to adopt this suggestion, and if so adopted the objection will be overcome.

The petition also asks that the "Examiner be required to forthwith give final action on the merits of the claims." As no reason is seen why the Examiner's action should be thus controlled, this request must be refused.

To the extent above indicated the petition is granted.

Printed Copies of Patents.

A printed copy of the complete specification and drawings of any patent published herein can be obtained for five cents.

Trade-Marks.

The publication of trade-marks under the act of February 20, 1905, in the OFFICIAL GAZETTE, commenced May 2, 1905, and will appear in each weekly number of the GAZETTE thereafter.

Extra copies of the trade-mark portion of the GAZETTE, which will be sold separately, may be obtained single or in quantities for five cents each. Coupons will be taken in payment therefor.

Interference Notice.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., February 1, 1906.

John H. Thompson & Company, their assigns or legal representatives, take notice:

An interference having been declared by this Office between the application of Charles H. Montanye, of New York, N. Y., for registration of a trade-mark and a trade-mark registered to John H. Thompson & Company, of Detroit, Mich., and the notice of said declaration mailed by the Patent Office in the usual manner to the said John H. Thompson & Company having been returned undelivered, notice is hereby given to the said John H. Thompson & Company, their assigns or legal representatives, that if they or any of them desire to contest the said interference they should immediately put themselves in communication with the Commissioner of Patents, in order that the notices of declaration heretofore sent by and returned to the Office may be forwarded to them.

This notice will be published in the OFFICIAL GAZETTE for six consecutive weeks. If no appearance shall be entered at the expiration of the period of publication, the interference will be proceeded with as in case of default.

F. I. ALLEN,
Commissioner.

APPLICATIONS UNDER EXAMINATION.

Condition at Close of Business February 20, 1906.

Room No.	Divisions and subjects of invention.	Oldest new application and oldest action by applicant awaiting office action. Amended	New.	No. of applications awaiting action.
	Under fifteen days.			
308	XV. Bread, Pastry, and Confections, Making, Coating, Laminated Sheets and Fabrics, Fuel, Glass, Hydraulic Lime and Cement, Paper-Making, Paving, and Plastics.	Feb. 14	Dec. 30	350
378	XXXVIII. Artesian and Oil Wells, Bottles and Jars, Care of Live Stock, Fishing and Trapping, Stationery, Stone-Working.	Feb. 12	Jan. 2	313
128	II. Bee Culture, Dairy, Label-Affixers, Paper Files and Binders, Presses, Store-Service, Tobacco, etc.	Feb. 8	Nov. 27	224
148	XXXII. Carbonating Beverages, Dispensing Beverages, Dispensing-Cans, Metallic Shipping and Storing Vessels, Packaging Liquids, Paper Receptacles, Refrigeration, Wooden Receptacles.	Feb. 8	Oct. 7	600
154	XI. Boot and Shoe Making, Boots, Shoes, and Leggings, Button, Eyelet, and Rivet Setting, Leather Manufacturing, Nailing and Stapling, Check-Controlled Apparatus, Whips and Whip Apparatus.	Feb. 7	Aug. 30	351
322	XXXVI. Curtains, Shades, and Screens, Drafting, Driers, Measuring Instruments, and Wind-Wheels.	Feb. 6	Jan. 18	225
321	I. Tillage, etc., Fences, and Railway Draft Appliances.	Feb. 6	Jan. 15	212
304	XXXIV. Railways, Railway-Brakes, Rolling-Stock.	Feb. 6	Jan. 2	350
244	XXXV. Baggage, Buckles, Buttons, and Clasps, Card, Picture, and Sign Exhibiting, Deposit and Collection Receptacles, Package and Article Carriers, Packing and Storing Vessels, Photography.	Feb. 6	Dec. 16	456
303	XVII. Linotyping, Printing, Matrix-Making, Nut and Bolt Locks.	Feb. 6	Dec. 4	320
144	XXIV. Apparel, Apparel Apparatus, Sewing-Machines, Surgery, Toilet.	Feb. 6	Oct. 24	457
175	III. Annealing and Tempering, Coating with Metal, Electrochemistry, Metal-Founding, Metallurgy, Shaping Fluid Metal.	Feb. 5	Jan. 12	303
	Under one month.			
105	XXVI. Electricity, Generation, Electric Heaters, Electric Railways, Motive Power.	Feb. 2	Aug. 10	705
152	XXX. Fluid-Pressure Regulators, Lamps and Gas-Fittings, Type-Writing Machines.	Feb. 2	May 18	662
172	XXXI. Alcohol, Charcoal and Coke, Distillation, Gas, Heating and Illuminating, Hides, Skins, and Leather, Liquid Coating Compositions, Oils, Fats, and Glue, Water Purification.	Feb. 1	Dec. 29	247
370	XXIII. Acoustics, Coin-Handling, Horology, Recorders, Registers, Optics, Signals, Time Controlling Mechanism.	Jan. 30	Oct. 3	665
179	XX. Artificial Limbs, Builders' Hardware, Dentistry, Locks and Latches, Safes, Undertaking.	Jan. 29	July 10	366
107	XXXVII. Electricity, Conductors, Lighting, Special Apparatus.	Jan. 29	July 7	711
122	XIX. Stoves and Furnaces and Steam-Boiler Furnaces.	Jan. 26	Aug. 19	613
318	VI. Bleaching and Dyeing, Chemicals, Explosives, Fertilizers, Medicines, Preserving, Sugar and Salt.	Jan. 25	Nov. 27	304

Applications Under Examination—Continued.

Room No.	Divisions and subjects of invention.	Oldest new application and oldest action by applicant awaiting office action. Amended	New.	No. of applications awaiting action.
332	X. Carriages and Wagons	Jan. 25	Oct. 9	879
133	XXII. Air-Guns, Ammunition and Explosive Devices, Boats and Buoys, Catapults and Targets, Firearms, Marine Propulsion, Ordnance, Ships.	Jan. 24	Oct. 21	287
167	V. Fine Arts, Bookbinding, Harvesters, Jewelry, and Music.	Jan. 22	Dec. 7	401
137	VIII. Beds, Chairs, Furniture, Kitchen and Table Articles, Store Furniture.	Jan. 22	Oct. 12	555
232	IV. Bridges, Conveyers, Cranes and Derricks, Excavating, Hoisting, Hydraulic Engineering, Loading and Unloading, and Towers.	Jan. 20	Jan. 22	289
112	XXI. Textiles, Carding, Knitting, Spinning, Weaving, etc.	Jan. 20	Aug. 11	580
	Between one and two months.			
324	XII. Elevators, Journal-Boxes, Lubricators, Machine Elements, Pulleys and Shafting.	Jan. 19	Dec. 8	410
147	XXIX. Coopering, Roofs, Wheelwright-Machines, Wooden Buildings, Wood-Sawing, Wood-Turning, Woodworking-Tools.	Jan. 19	Oct. 20	266
164	XXXIII. Canes, Canopies, Cutlery, Domestic Cooking Vessels, Electricity, Medical and Surgical, Electric Signaling, Fireproof Buildings, Harness, Masonry, Tents, and Umbrellas.	Jan. 18	Sept. 5	720
327	XVIII. Steam-Engineering, etc	Jan. 17	Nov. 4	406
307	XIV. Cutting and Punching Sheets and Bars, Farriery, Metal-Bending, Metal-Ornamenting, Metal Personal Wear, Making, Sheet-Metal Ware, Making, Tools, Wire-Working.	Jan. 11	Oct. 10	278
312	VII. Velocipedes, Clutches, Fire-Escapes, Games and Toys, Ladders, Mechanical Motors, and Paper Manufactures.	Jan. 6	Nov. 1	443
382	XXVIII. Air and Gas Engines, Air and Gas Pumps, Pneumatics.	Jan. 3	June 1	972
109	XVI. Telegraphy and Telephony	Dec. 27	Dec. 12	287
375	XXVII. Brushing and Scrubbing, Grinding and Polishing, Laundry, Washing Apparatus.	Dec. 27	Aug. 31	707
	Between two and three months.			
330	XIII. Arms, Projectiles, and Explosive Charges, Making, Metal-Working, Needle and Pin Making.	Dec. 13	Sept. 12	611
142	IX. Baths and Closets, Fire-Extinguishers, Hydraulic Motors, Pumps, Sewerage, and Water Distribution.	Dec. 12	June 9	05
	Between three and four months.			
315	XXV. Butchering, Mills, Threshing, and Vegetable Cutters and Crushers.	Nov. 6	Sept. 11	534

Total number of applications awaiting action 18,264

159	TRADE-MARKS, DESIGNS, LABELS AND PRINTS.			
	Between one and two months.			
	Trade-Marks	Jan. 19	Jan. 2	3076
	Under fifteen days.			
	Designs	Feb. 7	Jan. 12	61
	Labels and Prints	Feb. 17	Feb. 16	16

Notice.

Hereafter coupons unless properly filled out will not be accepted in payment for copies of publications.

PATENTS

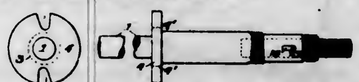
GRANTED FEBRUARY 27, 1906.

813,395. FILTER-PLATE. WILLIAM B. ALLBRIGHT, Chicago, Ill. Filed Aug. 8, 1904. Serial No. 218,208.

Claim.—1. The plate for lard and similar filtering-presses, having the channeled center and outstanding rim, and a connecting-surface between such center and rim provided with round knobs or buttons for supporting the cloth thereover at separated points so that filtering may be effective at such surface, in combination with a filtering-cloth resting upon such supporting means.

2. The plate for lard and similar filtering-presses, having its center provided with channeled means for supporting the filtering-cloth at separated points above its plane, a forwardly-projecting rim, and a surface between and connecting said center and rim, said connecting-surface being likewise provided with round knobs or buttons for supporting the cloth at separated points above its plane, in combination with a filtering-cloth resting upon the supporting means of said connecting-surface.

813,396. FRICTION-CLUTCH. SEVERIN C. ANKER-HOLTH, River side, Ill. Filed Nov. 1, 1905. Serial No. 285,276.

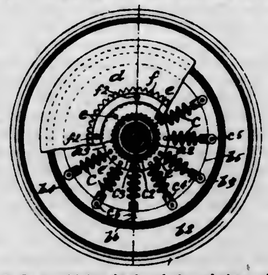


Claim.—1. In a device of the class described, in combination, a shaft, a friction-clutch mounted thereon, said clutch comprising a loosely-sleeved driving member, a member rotatively fixed to said driving-shaft but longitudinally movable thereon, and means rotatively fixed to said latter member for engaging and disengaging the two clutch members, a driving-gear loosely sleeved upon said shaft, and a ratchet connection between said gear and friction-clutch, as and for the purpose specified.

2. In a device of the class described, in combination, a shaft, a sleeve fixed to the end of said shaft and projecting outwardly therefrom, a friction-clutch mounted on said sleeve, said clutch comprising a member loosely journaled upon said sleeve, a member rotatively fixed to said sleeve but longitudinally movable thereon, and means rotatively fixed to said latter member for engaging and disengaging the two clutch members, a driving-gear loosely sleeved upon said shaft, and a friction-ratchet connection between said gear and clutch, substantially as and for the purpose specified.

3. In a device of the class described, in combination, a shaft, a sleeve provided with oppositely-disposed slots fixed to the end of said shaft and projecting outwardly therefrom, a friction-clutch mounted on said sleeve, said clutch comprising a member loosely journaled upon said sleeve, a member rotatively fixed to said sleeve but longitudinally movable thereon, and clutch-controlling means consisting of a rod having its outer end threaded and fitted within the bore of said sleeve, a pin engaging said rod, the hub of the longitudinally-movable clutch member and also the slots in said sleeve, a collar threaded to the end of the sleeve, a coil-spring interposed between said collar and the longitudinally-movable clutch member, and a hand-wheel mounted on the projecting end of said rod, a driving-gear loosely sleeved upon said shaft, and a friction-ratchet connection between said gear and friction-clutch, substantially as and for the purpose specified.

813,397. SPRING-WHEEL FOR VEHICLES. JOSÉ G. BARIO, Brooklyn, N. Y. Filed June 10, 1905. Serial No. 264,577.



Claim.—1. In a vehicle-wheel, a hub and rim, said hub being provided with a central outwardly-directed annular web member, and said rim being provided with an inwardly-directed annular web member, spiral tensional spring-spokes connecting said web members, and annular cover-plates secured to one of said web members and inclosing the said spokes and the adjacent edge of the other web member, one of said parts, the rim of the hub being movable toward and from the other part, and the connection of the spokes with one of said web members being a radially-movable connection, substantially as shown and described.

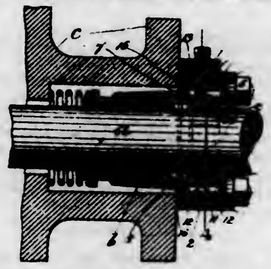
2. In a vehicle-wheel, a hub and rim, said hub and rim being provided one with an outwardly-directed annular flange or web member having an annular head and the other with an inwardly-directed annular flange or rim having an annular head, radial spiral tensional spring-spokes connecting said annular heads, the connection of said spokes with one of said heads being radially movable, and an annular cover-plate secured to one of said annular heads and inclosing said spokes and the other annular head, substantially as shown and described.

3. A wheel for vehicles, comprising a hub having a central annular web member provided with a thickened annular head, a rim provided with a central inwardly-directed annular web having an annular thickened member inwardly from which extends an annular flange, and tensional spiral spokes connecting said annular head and said annular flange, the connection between the said spokes and said flange being radially movable, substantially as shown and described.

4. A wheel for vehicles, comprising a hub having a central annular web member provided with a thickened annular head, a rim provided with a central inwardly-directed annular web having an annular thickened member inwardly from which extends an annular flange, and tensional spiral spokes connecting said annular head and said annular flange, the connection between the said spokes and said flange being radially movable, and said spokes and their connection being inclosed by annular side plates secured to said annular head, substantially as shown and described.

5. In a vehicle-wheel, a hub and rim, said hub being provided with a central outwardly-directed annular web member and said rim being provided with an inwardly-directed annular web member, spiral tensional spring-spokes connecting said web-members, and annular cover-plates secured to one of said web members and inclosing the said spokes and the adjacent edge of the other web member, one of said parts, the rim or the hub being movable toward and from the other part, and an annular gear secured to one side of said wheel, substantially as shown and described.

813,398. LUBRICATOR FOR PISTON-RODS. JOSHUA B. BARNES, Springfield, Ill. Filed Dec. 30, 1905. Serial No. 293,994.



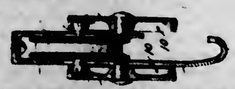
Claim.—1. In a lubricator for a piston-rod, the combination with the cylinder-head containing the packing for the said rod, of a box fixed to the cylinder-head and adapted for the free reciprocation of the piston-rod therethrough, a pocket in the outer wall of the box containing a lubricant and having a passage therefrom through the said wall into the box, and a perforated sleeve encircling the piston-rod and held in position thereon within the said box, the said sleeve being wrapped with absorbent material, substantially as described.

2. In a lubricator for a piston-rod, the combination with the cylinder-head having an opening therethrough for the said rod, of a box fixed to the cylinder-head and adapted for the free reciprocation of the piston-rod therethrough, a pocket in the outer wall of the box containing a lubricant and having a passage therefrom through the said wall into the box, and a perforated sleeve encircling the piston-rod and held in position thereon within the said box, the said sleeve being wrapped with absorbent material, substantially as described.

3. In a lubricator for a piston-rod, the combination with the cylinder-head containing the packing for the said rod, of a box fixed to the cylinder-head and having a wall at its rear side adjacent to the said head, a plate removably fixed to and adapted to close the front side of the box, the said wall and plate having an opening respectively surrounding the said rod at a suitable distance therefrom, a pocket in the outer wall of the box containing a lubricant and having a passage therefrom through the said wall into the box, and a perforated sleeve encircling the piston-rod and held in position thereon within the said box, the said sleeve being wrapped with absorbent material, substantially as described.

4. In a lubricator for a piston-rod, the combination with the cylinder-head containing the packing for the said rod, of a box fixed to the cylinder-head and adapted for the free reciprocation of the piston-rod therethrough, a pocket in the outer wall of the box containing a lubricant and having a passage therefrom through the said wall into the box, and a perforated sleeve encircling the piston-rod and held in position thereon within the said box, the said sleeve having lateral flanges, and having a wrapping of absorbent material between the said flanges, substantially as described.

813,399. DOOR-HANGER. RICHARD B. BROWNE, New York, N. Y., assignor to Risley, Browne & Donald, Brooklyn, N. Y. Filed May 14, 1904. Serial No. 208,009.



Claim.—1. In a door-hanger, the combination of a housing, a track-wheel, an elongated shaft therefor having outwardly-enlarged conical extremities, and antifriction-wheels on opposite sides of the track-wheel having bearings adapted to engage said enlarged extremities.

2. In a door-hanger, the combination with a hanger-frame of a track-wheel, a shaft therefor having projecting conical pintles, antifriction-wheels rotatively mounted on the frame on opposite sides of the track-wheel, and having annular interior conical bearings adapted to engage said conical pintles.

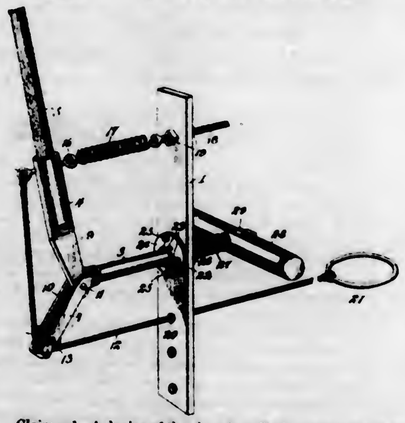
3. In a door-hanger, the combination with a housing and a track-wheel, of a fixed shaft on which said wheel is mounted in said housing to rotate therein, and having outwardly conical portions projecting on either side of the said housing, antifriction-wheels journaled on the outer face of the housing and having interior corresponding conical faces to respectively engage the conical portions of said shaft, substantially as set forth.

813,400. BASE-BALL BAT. CHARLES H. BUEHLER, St. Marys, Ohio. Filed July 23, 1904. Serial No. 217,236.

Claim.—1. A bat formed of longitudinal sector-shaped sections with the grain thereof disposed edgewise to the respective adjacent striking-faces of the bat.

2. A bat formed of longitudinal sector-shaped sections with the grain of some of the sections disposed edgewise to the respective adjacent striking-faces of the bat.

813,401. WHIP-OPERATING DEVICE. ALEXANDER BURROWS, Woodward, Okla. Filed July 25, 1905. Serial No. 271,541.



Claim.—1. A device of the class described, comprising an oscillatory whip-holder, a horizontal shaft capable of rotary movement to swing the whip-holder from one side to the other, means for locking the shaft in its adjustment, and means for oscillating the whip-holder.

2. A device of the class described, comprising a longitudinal shaft forming a rotary support, an oscillatory whip-holder mounted on the shaft and arranged to swing backward and forward, said whip-holder being carried from one side to the other by the rotary movement of the shaft, operating mechanism for oscillating the whip-holder, and means for holding the shaft in its adjustment while the whip-holder is being operated to apply the whip.

3. A device of the class described, comprising a ratchet, a shaft forming a rotary support and provided with means for engaging the ratchet, an oscillatory whip-holder mounted on the shaft, and a spring for maintaining the shaft in engagement with the ratchet.

4. A device of the class described, comprising a ratchet, a shaft capable of rotary movement and provided with means for engaging the ratchet, a coiled spring disposed on the shaft for holding the same in engagement with the ratchet, a handle connected with the shaft for operating the same, and an oscillatory whip-holder mounted on the shaft.

5. A device of the class described, comprising a ratchet having a series of notches, a rotary shaft provided with a projection for engaging the notches of the ratchet, a coiled spring disposed on the shaft in rear of the ratchet and normally maintaining the projection in engagement with the same, a whip-holder mounted on the shaft, and means for operating the whip-holder.

6. A device of the class described, comprising a shaft having an angularly-bent front portion provided with a guide, an oscillatory whip-holder mounted on the shaft in rear of the guide, a flexible connection arranged in the guide and connected with the whip-holder for moving the same in one direction, and a spring for moving the whip-holder in the opposite direction.

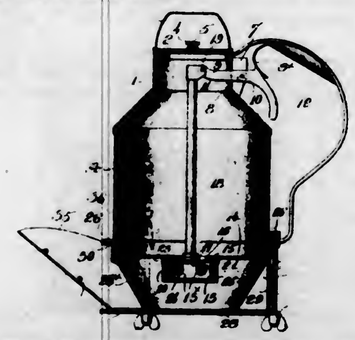
7. A device of the class described, comprising a bracket or bar, a shaft mounted on the bracket or bar for rotary adjustment, an oscillatory whip-holder pivoted to the shaft and carried from one side to the other by the rotary adjustment of the same, a spring connected with the bracket or bar and with the whip-holder for swinging the latter in one direction, operating mechanism connected with the whip-holder for swinging the same in the opposite direction, and means for holding the shaft in its adjustment while the whip-holder is being oscillated to apply the whip.

8. A device of the class described, comprising a horizontal shaft having an angularly-disposed slotted outer portion, a whip-holder pivoted at one end in the slot at the inner portion thereof, a guide-pulley mounted on the outer portion of the slot, a spring connected with the whip-holder for moving the same in one direction, and a flexible connection arranged on the guide-pulley and connected with the whip-holder for swinging the latter in the opposite direction.

9. A device of the class described, comprising a horizontal shaft mounted for rotary adjustment, a whip-holder pivotally mounted on the shaft, a spring connected at one end with the whip-holder, an adjusting-screw connected with the other end of the spring, and operating mechanism connected with the whip-holder.

10. A device of the class described, comprising a whip-holder, operating mechanism for oscillating the same to apply a whip, means for swinging the whip-holder from one side to the other to arrange the whip in position for striking either animal of a team, and means for retaining the whip-holder in such adjustment while the same is being operated to apply the whip.

813,402. PORTABLE MEASURING-CAN. JAMES L. CHASE, Ayer, Mass., assignor of one-half to Edward A. Turrell, Nashua, N. H. Filed Mar. 10, 1905. Serial No. 249,266.



Claim.—1. In a measuring milk-can, a supply-tank having an outlet in its bottom, a controlling-valve for said outlet, means to manually operate the valve, a measuring-compartment below the tank and into which the outlet opens, and provided with an open-top discharge-spout, and level-indicators within the spout and visible through its open top to indicate the quantity of liquid in the measuring-compartment by the level of the liquid in said compartment and spout.

2. In a portable milk-can, in combination, a supply-tank having a filling-opening, and an outlet in its bottom, a controlling-valve for the outlet, a handle attached to the tank, means to manually operate the valve, including an actuator adjacent the handle, a single measuring-compartment below the tank and having an open-top discharge-spout, and means located in the spout to indicate visually different quantities of liquid admitted to the measuring-compartment from the tank.

3. In a portable milk-can, in combination, a supply-tank having a handle and an outlet in its bottom, a manually-operated controlling-valve for the outlet, a detachable strainer surrounding the outlet and valve, a detachable measuring-compartment having an open top and adapted to tightly fit the lower end of the tank, means to fixedly connect the tank and compartment, the latter having an upwardly-inclined spout, and visual means within the spout to indicate the quantity of liquid admitted to the measuring-compartment.

4. In a device of the class described, a supply-tank having a tubular outlet depending from its bottom and provided with orifices in its wall, means mounted on the outlet to vary the effective area of the orifices, a valve slidable within the tubular outlet, and manually-operated means to control the valve, combined with a measuring-compartment connected with the bottom of the tank and having a discharge-spout, and means to indicate by the level of liquid in the measuring-compartment the quantity admitted from the tank.

5. In a measuring milk-can, a supply-tank having an outlet in its bottom, a manually-operated controlling-valve therefor, a measuring-compartment below and connected with the bottom of the tank having upwardly-flared walls and a radial, upwardly-inclined spout, and means located within the spout to indicate different quantities of liquid in said compartment.

6. In a portable milk-can, in combination, a supply-tank having a filling-opening and an outlet in its bottom, a controlling-valve for the outlet having an attached, upright stem, an actuating-lever fulcrumed on the tank and extended thereinto, a pivotal, detachable connection between the valve-stem and the inner end of the lever, a spring coöperating with the latter to normally maintain the valve seated, a handle on the tank and serving also as a guard for the outer end of the lever, a measuring-compartment connected with the bottom of the tank, and means to indicate visually the quantity of liquid admitted to the compartment when the valve is manually moved to open the outlet.

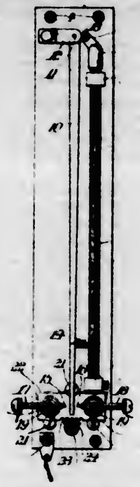
7. In a device of the class described, a supply-tank having a filling-opening in its top and a closure therefor, a depending, tubular outlet in its bottom, a controlling-valve slidable in the outlet, the wall of the latter having vent-orifices, a detachable, cup-like strainer to fit over the said outlet, and manually-operated means to actuate the valve, combined with a measuring-compartment open at its top to snugly receive the bottom of the tank, detachable means to maintain the tank and compartment connected, a discharge-spout for the compartment, having an inclined bottom and an open top, and level-indicating bars on the spout-bottom to indicate the quantity of liquid in the compartment.

813,403. THERMOSTAT. ARTHUR D. COLTON, Chicago, Ill. Filed Aug. 22, 1904. Serial No. 221,785.

Claim.—1. The combination with a base-plate, 1, of a circuit-closer arranged therein and comprising a strip, 5, of expansible and contractible material and secured at its lower end to said base-plate, a supporting-lug, 7, secured to the base-plate and loosely engaging said strip, a bell-crank-shaped lever pivoted to said base-plate and having a long arm, 10, and a short arm, 13, a cap-piece or ferrule, 8, engaging the upper end of said strip and having an extension or arm, 9, engaging the short arm, 13, of the bell-crank, and electrical contacts, 15 and 16, between which said long arm, 10, is adapted to operate; substantially as described.

2. The combination with a base-plate, 1, of a circuit-closer arranged therein and comprising a strip, 5, of expansible and contractible material and secured at its lower end to said base-plate, a supporting-lug, 7, secured to the plate and loosely engaging said strip, a bell-crank-shaped lever pivoted to said base-plate and having a long depending arm, 10, and a short arm, 13, a cap-piece or ferrule, 8, engaging the upper end of said strip and having an extension or arm, 9, engaging the short arm, 13, of the bell-crank, and a coiled

spring, 14, secured at one end to the strip, against the other end of which spring the long arm, 10, is adapted to contact; substantially as described.



3. A thermostat comprising a base-plate, a rod of expansible and contractible material, a block mounted on the base-plate and to which one end of said rod is secured, a lug supporting the other end of said rod and through which the same is adapted to slide, a bell-crank lever fulcrumed to the base in proximity to the movable end of said rod, a connection from said end to the short arm of the lever, two electrical contacts with which the long arm of said lever is adapted alternatively to engage, a sliding plate upon which said contacts are mounted, said plate being provided with rack-teeth on one edge, a shaft carrying a segment engaging said rack-teeth, and a handle mounted on said shaft and adapted to move the same to move the plate and pointer.

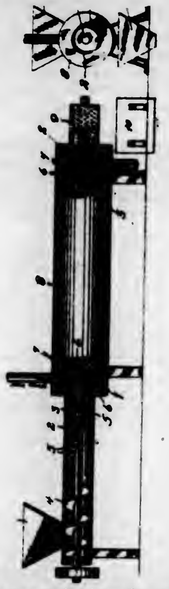
4. A thermostat comprising a frame, two perforated lugs mounted thereon, a thermostatic rod with its two ends passing through said lugs, means for clamping one end of said rod to its associated lug, whereby the rod may be readily adjusted with relation to or removed from said lug, a bell-crank lever fulcrumed to the frame in proximity to the other lug, a connection between the free end of the rod and the short arm of said lever, the long arm of the lever extending parallel to said thermostatic rod, and an adjustable electrical contact with which the end of said long arm is adapted to engage.

5. A thermostat comprising a base-plate, a thermostatic rod having one end immovably and the other end slidably mounted on said base-plate, a contact-arm fulcrumed to the base-plate in proximity to the free end of said rod, a connection between said end and said contact-arm, contact-points arranged in proximity to the other end of said rod, and with which the free end of said arm is adapted to engage, a movable mounting for said contact-points, and a pointer operatively connected with said movable mounting and adapted to move therewith, said thermostatic rod, contact-arm and pointer being arranged parallel to each other and to the base, whereby a compact structure is obtained.

6. A thermostat comprising a base-plate and a face-plate, a thermostatic rod mounted on the base-plate, a contact-arm mounted on the base-plate and arranged to be moved by the expansion or contraction of said thermostatic rod, two contact-screws with the points of which said contact-arm is adapted alternatively to engage, the heads of said screws projecting beyond the frame of said thermostat, and set-screws adapted to engage said contact-screws, the heads of said screws projecting through said face-plate into an accessible position, whereby the adjustment of the thermostat may be readily varied.

818,404. PROCESS FOR REMOVING ROUGH AND IRREGULAR FOREIGN SEEDS FROM CLOVER AND OTHER SMOOTH SEEDS. DAVID S. COOK, Dana, Ohio, assignor of one-third to Joseph W. McCord and one-third to William S. Cook, Columbus, Ohio. Filed July 19, 1905. Serial No. 270,313.

Claim.—1. A process for separating irregular and other foreign seeds from clover and other smooth seeds, consisting in depositing a heavy material in the concavities of the foreign seeds, and separating the seeds containing the deposits of heavy material from the other seeds by suitable means.

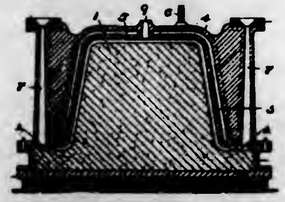


2. A process for separating irregular and other foreign seeds from clover and other smooth seeds, consisting in first mixing the seeds with an adhesive paste containing a heavy material, second, drying the mixture, third, removing the superfluous portions of the paste which has been dried without disturbing the paste deposited in the concavities of the foreign seeds, and fourth, separating the foreign seeds containing the paste deposits from the other seeds by suitable means.

3. A process for separating irregular and other foreign seeds from clover and other smooth seeds, consisting in depositing a metallic material in the concavities of the foreign seeds and then separating the foreign seeds from the other seeds by magnetic attraction.

4. A process for separating irregular and other foreign seeds from clover and other smooth seeds, consisting in first mixing the seeds with a paste having metallic properties so that the concavities of the foreign seeds are filled by the said paste, second, drying the mixture, third, removing the surplus paste which has been dried and polishing the seeds leaving the paste only in the grooves or concavities of the foreign seeds, and fourth, separating the seeds having the metallic paste deposits from the other seeds by magnetic attraction.

818,405. MOLD FOR CASTING HOLLOW WARE. FREDERICK D. COOK and GEORGE A. COMRATH, Blairsville, Pa. Filed Jan. 14, 1905. Serial No. 241,089.



Claim.—A mold for casting hollow ware comprising a sand core and a hollow metal member, said sand core and metal member formed with a space therebetween, said metal member formed with a pouring-gate communicating with said space, said pouring-gate tapering inwardly toward the upper end thereof, and a gate-box formed in its entirety of a mass of material having straight outer walls and formed with an opening tapering inwardly toward the bottom thereof, said gate-box being arranged above said pouring-gate, substantially as described.

818,406. TABLE-LEG FASTENING. JOSEPH CORNELL, Rockville, N. Y. Filed July 14, 1905. Serial No. 269,657.

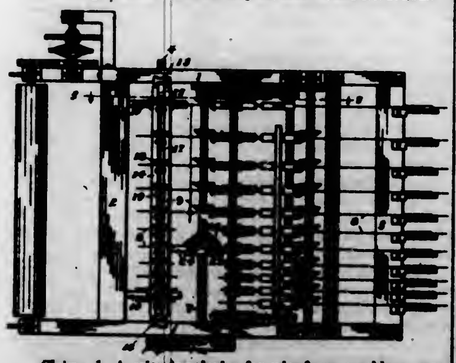
Claim.—1. The combination with a table-top having a socket in the under side thereof, of a block secured to the under side of the table across the socket and provided with a slot intersecting one edge of the block with its inner end registered with the socket, the back of the slot being laterally enlarged at opposite sides, the block being provided with a guide-shoulder extending in front of the open end of the slot in parallelism with one wall of the slot, a table-leg, a pin projecting centrally from the top of the leg and having its upper portion threaded, and a nut fitted to the threaded portion of the pin and capable of being entered into the enlarged back portion of the slot, the upper end of the pin being adapted to enter the socket in the under side of the table-top when the leg is screwed up tight against the block.

2. As a new article of manufacture, an element of a table-leg fastening consisting of a block provided with a slot intersecting one edge thereof and having its back laterally enlarged at opposite sides, that end of the block which is intersected by the slot having a shoulder projecting in front of the slot in substantial parallelism with one of the longitudinal walls thereof and intersected by the adjacent lateral enlargement of the slot.

818,407. TAG-CLASP. SIMON DANSTORM, Dayton, Ohio; Sel Finzer administrator of said Simon Danstorm, deceased. Filed Mar. 31, 1902. Serial No. 100,739.

Claim.—As an improved article of manufacture the tag-clasp comprising the central arc, the outward curves from said arc, the straight flexible arms crossing near their outer ends, and terminating in hooks bent oppositely at an acute angle to said arms, substantially as described.

818,408. CRIMPING MECHANISM FOR WIRE-FENCE MACHINES. WASHINGTON M. DILLON and PETER FRANTZ, Sterling, Ill. Filed Aug. 17, 1904. Renewed Aug. 17, 1905. Serial No. 274,965.



Claim.—1. A crimping device for wire-fence machines, comprising a crimping-bar, capable of vertical play in the machine; a series of stationary dies, fixed on said bar; a slide-bar, adapted to be supported in said crimping-bar, so as to oscillate therein; a series of dies, secured on said slide-bar, and adapted to be severally brought into proximity with one of said stationary dies upon the proper operation of said slide-bar, the adjacent faces of the several pairs of dies being adapted to suitably embrace the strand-wires of the fence and crimp the same on opposite sides of the stay-wire coils; a pair of parallel cross-bars, on opposite sides of the crimping-bar; means for suitably raising and lowering the crimping-bar; means for suitably oscillating said slide-bar, to bring said last-named dies into proximity with said first-named series of dies; and means for lowering said parallel bars upon the strand-wires simultaneously with the raising of said crimping-bar, substantially as shown and set forth.

2. In a crimping device for wire-fence machines, the combination, with the frame 1, of the cross-bar 14, having vertical play therein, and provided with the channel 16, the slide-bar 17, supported in the bar 14, and adapted to oscillate therein; the dies 18, fixed on the bar 14, and provided on their inner faces with ribs 27 and jaws 29; the dies 19, fixed on the slide-bar 17, and provided on their inner faces with ribs 28 and jaws 30; means for suitably raising and lowering the bar 14, and means for suitably oscillating the slide-bar 17, to bring the adjacent faces of the dies 18 and 19 into proximity, substantially as shown and described.

3. In a crimping device for wire-fence machines, the combination of the vertically-movable bar 14, suitably mounted in the machine; and provided on its upper face with a series of dies 18, the slide-bar 17, supported in the bar 14 so as to have oscillation therein, and provided on its upper face with the dies 19, the rock-shaft 39 suitably mounted on the frame 1, the series of arms 40, secured on the shaft 39 and provided with claws 41; means for suitably rocking the shaft 39; means for raising and lowering the bar 14, and means for oscillating the slide-bar 17, substantially as set forth.

4. In a crimping device for wire-fence machines, the combination of the bar 14, provided with the channel 16; the slide-bar 17, suitably mounted in the recess 16, to oscillate therein; the series of dies 18, fixed on the upper face of the bar 14; the series of dies 19, fixed on the upper face of the slide-bar 17, and adapted to be brought into proximity with the dies 18, upon the oscillation of the bar 17, the parallel bars 38, suitably supported on opposite sides of the bar 14; the arms 40, suitably mounted above the strand-wires of the fence and provided with claws 41; means for operating the arms 40, to cause the claws thereon to engage said strand-wires; means for raising the bar 14; means for simultaneously lowering the bars 38; and means for oscillating the slide-bar 17, substantially as shown and set forth.

5. In a crimping device for wire-fence machines, the combination of the oscillating bar 17, provided with a series of dies 19, the lever 20, pivoted beneath said bar 17, and connected therewith by means of the link 21, and means for operating the lever 20 to oscillate the bar 17; substantially as set forth.

6. In a crimping device for wire-fence machines, the combination of the rock-shaft 34, suitably mounted on the frame of the machine; the arms 35, fixed thereon, racks 37, supported by the arms 35; cross-bars 38, supported by the racks 37; and means for suitably operating the arms 35; substantially as shown and described.

7. In a crimping device for wire-fence machines, wherein the fence is formed with series of stay-wires in substantial alinement transversely of the fence, the combination, with series of dies adapted to form crimps in the strand-wires of the fence at the points of junction of the stay-wires therewith, of a rock-shaft, a series of arms mounted on such rock-shaft, corresponding in number and vertically in line with the strand-wires, such arms being provided with claws adapted to engage the strand-wires, and bring the several stay-wires of a series into transverse alinement thereon, and means for suitably rocking such shaft, substantially as shown.

818,409. HEAD-BLOCK FOR HAY-PRESSES. ELVIS B. DRAKE, Nashville, Tenn. Filed Oct. 6, 1905. Serial No. 281,698.

Claim.—1. A head-block provided with a wire-receiving groove, and means located within the groove for guiding a wire through the same and for yieldably holding the wire in the groove.

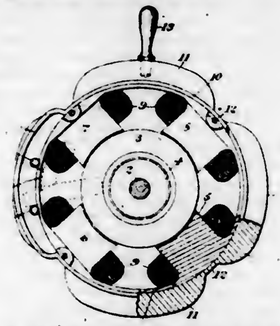
2. A head-block provided with a wire-receiving groove, and means for yieldably retaining the wire in the groove.

3. A head-block provided with a wire-receiving groove, and a metallic lining having resilient sides spaced from the walls of the

groove at the longitudinal mouth or opening thereof and constricting the same, said sides being adapted to expand to permit the wire to be drawn through them.

4. A head-block having a wire-receiving groove provided with outwardly-converging side walls, and a metallic lining arranged within the groove and having converging side walls, said side walls being resilient to engage the inner portions of the side walls of the groove, and the outer portions of the sides of the lining being spaced from the walls of the groove and constricting the longitudinal opening or mouth of the same.

813,410. **MOTOR CONTROL.** CHARLES A. ECK, Newark, N. J. Filed May 16, 1905. Serial No. 260,613.



Claim.—1. The combination with a motor having poles and an armature, of a yoke having portions of varying cross-sectional area, and means for adjusting the yoke so as to cause the magnetic lines to flow through that portion of the yoke having the large cross-sectional area or through that portion of the yoke having the small cross-sectional area at will.

2. The combination with a motor having poles and an armature, of an adjustable yoke having a portion of a large cross-sectional area of a length somewhat longer than the distance between the poles and having a portion of a smaller cross-sectional area whereby the speed of the motor can be varied by causing the lines of force to run through either of the two portions.

3. The combination with a motor having poles and an armature, of an adjustable yoke-ring having a series of portions of a large cross-sectional area, each somewhat longer than the distance between the poles, and having portions of a smaller cross-sectional area connecting the portions of the large cross-sectional area.

4. The combination with a motor having a casing, poles and an armature, of a contact-plate stationary with the motor, a switch-lever adapted to be moved into contact with said plate, a yoke-ring circumferentially adjustable on the casing and having alternating portions of large and small cross-sectional area, and means on said yoke-ring for moving the switch-lever into contact with the plate.

5. The combination with a motor having a casing, poles and an armature, of a contact-plate stationary with the motor, a switch-lever adapted to be moved into contact with said plate, a yoke-ring circumferentially adjustable on the casing and having alternating portions of large and small cross-sectional area, means on the yoke-ring for moving the switch-lever into contact with the plate when turned in one direction and out of contact with the contact-plate when turned in the opposite direction, and a spring for pulling the switch-lever away from the contact-plate on a quick action.

6. In a motor, the combination with two contact-plates, a switch-lever adapted to be moved into position between the two and fitting snugly so as to maintain the said lever in the position to which it has been moved, an adjustable yoke-ring on the casing of the motor, means carried by said ring for moving the switch-lever in between the two contact-plates and back again out of engagement between the said two plates, and a spring for returning the switch-lever to its original position after it is moved out of contact between the two plates.

7. The combination with a motor having poles and an armature, of circumferentially-adjustable means for varying the cross-sectional area of the field at a point between the poles.

8. The combination with a motor having poles and an armature, of an adjustable yoke-ring having a series of portions of large cross-sectional area and having portions of a smaller cross-sectional area connecting the portions of the large cross-sectional area, whereby the magnetic lines can be caused to flow through that portion of the yoke having the large cross-sectional area or through that portion of the yoke having the smaller cross-sectional area at will.

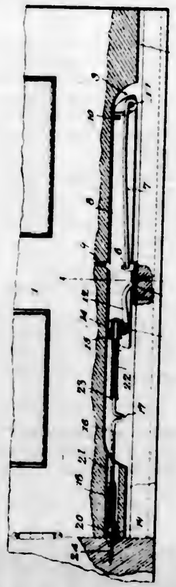
9. The combination with a motor having poles and an armature, of adjustable means for varying the cross-sectional area of the field at a point between the poles, and a switch adapted to be operated by the adjustment of the adjustable means.

10. The combination with a motor having poles and an armature, of circumferentially-adjustable means for varying the cross-sectional area of the field at a point between the poles, and a switch adapted to be operated by the adjustment of the circumferentially-adjustable means.

11. The combination with a motor having poles and an armature, of adjustable means for varying the cross-sectional area of the field at a point between the poles, a switch adapted to be moved by the adjustable means and so arranged that when it is thrown in the motor will run at its slowest speed and will remain closed while the said adjustable means is moved to increase the speed of the motor.

12. The combination with a motor having poles and an armature, of circumferentially-adjustable means for varying the cross-sectional area of the field at a point between the poles, a switch adapted to be moved by the circumferentially-adjustable means and so arranged that when it is thrown in the motor will run at its slowest speed and will remain closed while the said adjustable means is moved to increase the speed of the motor.

813,411. **WEATHER-STRIP.** CLARENCE M. EVELETH, Plymouth, N. H. Filed Oct. 14, 1904. Serial No. 228,457.



Claim.—1. A door having a weather-strip working in a slot in the bottom of the door, means housed within the back of the slot for projecting the weather-strip and including a trip-rod working through the hinge edge of the door for contact with the door-frame to project the weather-strip, said rod capable of being shifted in an endwise direction to bring its outer end within the hinge edge of the door, whereby said edge of the door may be planed without interference by the rod.

2. A door having a weather-strip working in a slot in the bottom of the door, and means housed within the back of the slot for projecting the weather-strip and including a trip-rod working through the hinge edge of the door for contact with the door-frame to project the weather-strip, said rod having a threaded adjustment for moving the same endwise to a position entirely within the door, whereby the hinge edge of the door may be planed without interference by the trip-rod.

3. The combination with a door having a slot in the lower edge thereof with the intermediate portion of the slot extended to form a recess, the door being provided with an opening intersecting its hinged edge and the recess, a weather-strip working in the slot, a spring to yieldably retract the strip, an angle-lever fulcrumed within the recess with one end portion engaging the strip, an endwise-movable threaded trip-rod working through the opening in the door and also through the opening in the lever, non-rotatable slidable nuts within the recess at opposite sides of the lever and adjustably receiving the threaded portion of the rod, and a helical spring embracing the rod and bearing against the lever and the outer nut, the outer end of the rod being provided with a screw-driver seat which is accessible through the outer end of the opening in the door to permit endwise adjustment of the rod.

813,412. **TOOL.** RAISON FRISLER, Harrisburg, Pa. Filed Oct. 22, 1904. Serial No. 229,023.

Claim.—1. As a new article of manufacture, a tool or implement comprising a pair of scissors having blades of different length, the shorter blade being provided with an acting end, the longer blade being tapered to act as a box-opener, and a stop on the longer blade whose stop-face is forward of the cutting-terminal of the shorter blade when closed, whereby the same is protected, substantially as described.

2. As a new article of manufacture, a tool or implement comprising a pair of scissors having blades of different length, the shorter blade being provided with an acting end, the longer blade being tapered to act as a box-opener, a stop on the longer blade whose stop-face is forward of the cutting-terminal of the shorter blade when closed, whereby the same is protected, and releasable means for locking the blades in closed position, substantially as described.

3. As a new article of manufacture, a tool or implement comprising a pair of scissors having blades of different length, the shorter blade being provided with an acting end, the longer blade being tapered to act as a box-opener, and a stop on the longer blade having a flat face and whose stop-face is between the ends of the blades when closed, whereby the shorter blade is protected, substantially as described.

4. As a new article of manufacture, a tool or implement comprising a pair of scissors having blades of different length, the shorter blade being provided with an acting end, the longer blade being tapered to act as a box-opener, a stop on the longer blade having a flat face and whose stop-face is between the ends of the blades when closed, whereby the shorter blade is protected, and releasable means for locking the blade in closed position, substantially as described.

5. As a new article of manufacture, a tool or implement comprising a pair of scissors having one of its blades longer than the other, the shorter blade having at its outer end a cutting edge, and means for locking the blades closed, substantially as described.

6. As a new article of manufacture, a tool or implement comprising a pair of scissors having one of its blades longer than the other, the shorter blade being sharpened, and a spring-actuated bolt arranged to lock the blades closed, substantially as described.

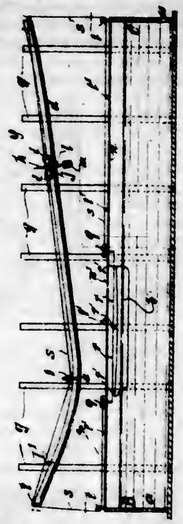
7. As a new article of manufacture, a tool or implement comprising a pair of scissors having one of its blades longer than the other, the shorter blade having its end sharpened, and a spring-actuated bolt for locking said blades closed, substantially as described.

8. As a new article of manufacture, a tool or implement comprising a pair of scissors with one blade longer than the other, said longer blade having a tapering end adapted to opening boxes, and the other a sharpened end adapting it to cut the labels, and means for locking the two blades closed, substantially as described.

813,413. **EXPERIMENTAL TANK FOR TESTING SHIPS' MODELS.** JOHN H. PERRY, Barrow-in-Furness, England. Filed May 31, 1905. Serial No. 263,660.

Claim.—1. An experimental tank for testing boat models, comprising a horizontal railway, a trolley thereon connected with the model, an inclined railway, and a weighted trolley thereon operatively connected with the model trolley.

2. An experimental tank comprising, in combination, a vessel, an inclined railway supported on the vessel, a weighted trolley running on the inclined railway and means for connecting the trolley to the model being experimented with.



3. An experimental tank comprising, in combination, a vessel, an inclined railway supported on the vessel, a horizontal railway, a weighted trolley adapted to run on the inclined railway, a trolley adapted to run on the horizontal railway and means for connecting the trolleys together and to the model being experimented with.

4. An experimental tank comprising, in combination, a vessel, an inclined railway which is curved up at one end, a horizontal railway arranged below the inclined railway, trolleys running on both railways, and means for connecting the trolleys together and to the model being experimented with.

5. An experimental tank comprising, in combination, a vessel, an inclined railway supported on uprights fitted to the vessel, a horizontal railway arranged below the inclined railway and also supported by said uprights, a weighted trolley adapted to run on the inclined railway, two trolleys adapted to run on the horizontal railway, guide-pulleys and means for connecting the trolleys together and to the model being experimented with.

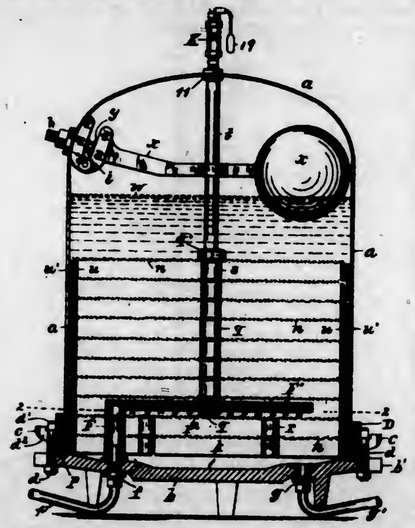
6. An experimental tank comprising, in combination, a vessel, an inclined railway which is curved upward at one end supported on uprights fitted to the vessel, a horizontal railway arranged below the inclined railway, a trolley having a pointer and also means for attaching weights, two trolleys having depending arms and adapted to run on the horizontal railway, guide-pulleys, a cord connecting the three trolleys together and running over the guide-pulleys and a separate cord connecting the two trolleys of the horizontal railway together and being also removably connected to the model being experimented with.

813,414. **BEVERAGE-CARBONATOR.** JOHN H. FOX, New York, N. Y., assignor to Mott Carbonator Company, Utica, N. Y., a Corporation of New York. Filed Apr. 20, 1903. Renewed Aug. 4, 1905. Serial No. 273,704.

Claim.—1. In a carbonator, the combination, with a shell having means therein for mingling the gas and water, a water-inlet, a gas-inlet, a water-outlet, and a removable bottom, of the flange D attached to the shell and having below its upper edge the belting-ring with annular groove D′ to sustain bolt-heads below the top of the flange D, the oblong radial bolt-holes d^3 in the belting-ring, the integral ring e closing the outer ends of the slots, and the base b having slots b' corresponding with the bolt-holes, with bolts d having nuts thereon and T-heads d' adapted to pass upwardly through the bolt-holes d^3 and turn into the groove D′, substantially as herein set forth.

2. In a carbonator, the combination, with a shell having means therein for mingling the gas and water, and having a water-inlet, and a removable bottom provided with a gas-inlet and water-outlet, of the flange D attached to the shell flush with its bottom and having below its upper edge the belting-ring with annular groove D′, to

sustain bolt-heads below the top of the flange D, the bolting-ring having the oblong radial bolt-holes d^2 intersecting the groove D' with integral ring e closing the outer ends of the bolt-holes, and the base b having slots b' corresponding to the bolt-holes, with bolts d having nuts thereon and T-heads d' adapted to pass through the bolt-holes d^2, and turn into the groove D, the whole arranged and operated substantially as herein set forth.



3. In a carbonator, the combination, with a shell having integral top and open bottom, and a base with bolting-flanges and bolts connecting it with the bottom of the shell, of the series of disks supported loosely upon the base, means for maintaining a water-level within the shell above the top of the disks, a central tie-bolt extended through the disks securing them together, and a central stop extended between the top of the tie-bolt and the top of the shell, and the shell entirely detachable from the disks to permit its removal by lifting therefrom when desired, substantially as herein set forth.

4. In a carbonator, the combination, with the shell and a removable bottom, of the pile of disks secured together in a movable group by a central tie-bolt and supported upon the bottom, a stop arranged centrally above the pile of disks between the top of such tie-bolt and the top of the shell, a water-inlet nozzle at the side of the shell above the pile of disks, and a valve with lever having a float upon the same diametrical line as the inlet-nozzle and the lever formed to clear the central stop, substantially as herein set forth.

5. In a carbonator, the combination, with the shell having water-inlet for supplying the shell with water and having a removable bottom provided with water-outlet *g* and gas-inlet nozzle *f* having thread upon its inner end, of a series of disks supported upon the bottom, the lower disk being detachable from the bottom and from the said series and formed with an aperture over the nozzle *f*, the distributer having shank connected detachably with the said nozzle through the said aperture, and having one or more perforated arms with holes in the lower side extended over such lower loose disk, whereby the water may be drawn from the bottom outlet *g* adjacent to the perforated arm, and the direct passage of gas from such arm to the outlet prevented by the lower loose disk.

6. In a carbonator, the combination, with the shell having water-inlet for supplying the shell with water and having a removable bottom provided with water-outlet *g* and gas-inlet nozzle *f* having thread upon its inner end, of a series of disks supported upon the bottom, the lower disk being detachable from the bottom and from the said series and formed with an aperture over the nozzle *f*, and the remainder of the series being connected by a central tie-rod, the distributer having shank F extended downwardly through such aperture and screwed detachably upon said nozzle, and having a plurality of perforated arms F' extended over such lower loose disk, whereby the water may be drawn from the water-outlet *g* adjacent to the perforated arms, and the direct passage of gas from such arms to the outlet prevented by the lower loose disk.

7. In a carbonator, the combination, with a shell having means therein for mingling gas and water, of a bottom secured removably thereto and provided with a gas-inlet and water-outlet, and a series of disks formed of pervious woven fabric provided each at the margin with two supporting-hoops *u* and *u'*, the fabric of the disk being gathered at the edges around the outer side of the hoop *u* and clamped thereon by the hoop *u'*, and the hoops being adjusted to sustain the entire series upon one another and upon the bottom *b*, substantially as herein set forth.

8. In a carbonator, the combination, with a shell having means therein for mingling the gas and water, of a bottom secured removably thereto and provided with a gas-inlet and water-outlet, and a series of disks formed of pervious woven fabric provided each at the margin with two cylindrical hoops *u* and *u'*, the fabric of the disk being gathered at the edges around the outer side of the hoop *u* and clamped thereon by the hoop *u'*, the cylindrical form of the hoops preventing them from nesting within one another and sustaining the entire series upon one another and upon the bottom *b*.

9. In a carbonator, the combination, with the shell and a removable bottom, of the pile of disks secured together in a movable group by a central tie-bolt and supported upon the bottom, a stop arranged centrally above the pile of disks between the top of such tie-bolt and the top of the shell, a water-inlet nozzle at the side of the shell above the pile of disks, and a valve with lever having a float, and the lever formed to clear the central stop, substantially as herein set forth.

10. In a carbonator, the combination, with a shell having closed top and open bottom, and a bottom attached removably to the shell, of a fixture, as the outlet-valve K, secured in the center of the shell at the top, a series of disks supported upon the bottom, the lower disk being detachable from the bottom and from the said series, a gas-distributer extended upwardly through such lower disk, the remainder of the series being connected together by a central tie-bolt, and a central stop extended between the top of the tie-bolt and the fixture secured to the top of the shell.

11. In a carbonator, the combination, with a shell having integral top and open bottom, and a base and bolting-flanges and bolts connected detachably with the bottom of the shell, of the series of disks supported loosely upon the base, means for maintaining a water-level within the shell above the top of the disks, a central tie-bolt extended through the disks securing them together, and a stop integral with the tie-bolt extended into loose contact with the top of the shell, whereby the shell may, when necessary, be lifted simultaneously from the bottom and the series of disks, and the disks then lifted from the bottom, substantially as shown and described.

818,415. TAILOR'S MEASURE. IGNATIUS GERAGI, Washington, D. C., assignor of one-half to Charles Lipkins, Washington, D. C. Filed Feb. 21, 1905. Serial No. 246,660.

Claim.—1. A tailor's measure, comprising a square having two arms, one of which is provided with a longitudinally-extending facial groove, a plate covering a part of the groove at the angle of the square, and a rule slidably mounted in said facial groove and adapted to have one end projected beyond the outer edge of the angle between the two arms of the square and also adapted to be moved back in the groove to bring its outer end substantially flush with said edge.

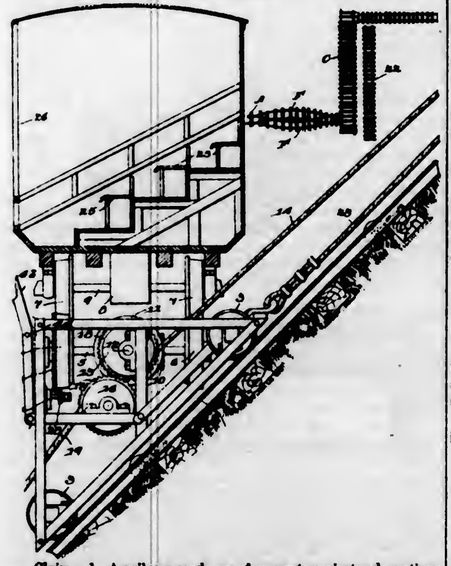
2. As an article of manufacture, a tailor's measure for taking short and slope measurements, comprising a square having two arms, one of which is provided with a longitudinally-extending facial groove, a plate covering a part of the groove, a rule slidably mounted in said groove and retained therein by said plate, said rule being adapted to have one end projected beyond the outer edge of the angle between the two arms and to be moved back to bring said end substantially flush with said edge, and a flexible tape-measure loosely connected at one end to said angle.

3. A tailor's measure, comprising a square having two normal arms, one of which is provided with a longitudinally-extending facial groove, a rule slidably mounted in said groove and adapted to have one end thereof projected beyond the outer edge of the angle between the two arms of the square and also adapted to be moved back in the groove to bring its outer end substantially flush with said edge, and means at opposite ends of the groove to limit the sliding movement of the rule in both directions.

4. A tailor's measure, comprising a square having two arms, one of which is provided with a facial groove extending throughout nearly its entire length, a rule of less length than said arm slidably mounted in the groove and adapted to have one end projected beyond the outer edge of the angle between the two arms of the square and also adapted to be moved back in said groove, and a flexible tape-measure loosely connected at one end to said square at a point adjacent the inner angle thereof.

5. A tailor's measure comprising a square having two arms, one of which is provided with a facial groove extending throughout nearly its entire length, a rule of less length than said arm slidably mounted in the groove and adapted to have one end projected beyond the outer edge of the angle between the two arms of the square and also adapted to be moved back in said groove, means for limiting the longitudinal movement of the rule in both directions, and a flexible tape-measure loosely connected at one end to said square at a point adjacent the inner angle thereof.

813,416. RAILWAY. LEWIS GIBSON, Colorado Springs, Colo. Filed Nov. 17, 1905. Serial No. 287,880.



Claim.—1. A railway made up of separate main-track sections at different elevations, a supplemental inclined track section connecting main-track sections, and car-actuated means for raising and lowering cars along the inclined sections.

2. A railway made up of separate main-track sections at different elevations, a supplemental inclined track section connecting main-track sections, and car-operated means operating at the inclined section only for moving cars thereon.

3. A railway made up of separate main-track sections at different elevations, a supplemental-track section connecting main-track sections, an elevator running upon the supplemental-track section and provided with means to be actuated by the driving mechanism of the car for running the elevator.

4. A railway made up of separate main-track sections at different elevations, a supplemental-track section connecting adjacent main-track sections, a truck running upon the supplemental-track section, a hoisting-drum carried by the truck, an elevating-cable wound upon the drum and anchored independently of the truck, and drum-operating means carried by the truck and disposed for operation by the driving-wheels of a car to be elevated by the truck.

5. A railway made up of separate main-track sections at different elevations, a supplemental-track section connecting the main-track sections, truck-driving means carried by the truck, track-rails provided upon the truck, and friction-wheels mounted upon the truck in operative relation with the truck-driving means, the track-rails having spaces therein through which the friction-wheels project into position for engagement by the driving-wheels of a car upon the truck.

6. A railway made up of separate main-track sections at different elevations, a supplemental-track section connecting adjacent main-track sections, an elevator running upon the supplemental-track section and provided with means actuated by the driving mechanism of the car for running the elevator, and a clutch mechanism carried by the elevator for engagement with the car-wheels to prevent the car from running off of the elevator.

7. The combination of an inclined track, an elevator running thereon and provided with rails having corresponding portions removed, elevator-actuating mechanism carried by the elevator and provided with drive-wheels working in the space provided in the rails and exposed to the drive-wheels of a car upon the rails, and clutches carried by the elevator for engagement with the other car-wheels to prevent the car from running off of the track when the latter is in motion.

8. The combination of an elevator having a track for the support of a motor-car, elevator-actuating mechanism carried by the elevator and provided with friction-wheels exposed for engagement with the power-wheels of a car upon the track, each rail of the track being provided with a pair of transverse grooves, grooved guideways leading outwardly from the grooves of the rails, wheel-engaging clutches working in the grooves and guideways, means connecting the corresponding clutches at opposite sides of the track for simultaneous movements in opposite directions, and controlling-levers for the respective sets of clutches.

9. The combination of an inclined track, a truck running thereon, rails upon the truck, one of the rails having a vertical opening therein, and truck-operating means having a drive-wheel working in the opening of the rail and exposed through the top thereof to the driven wheel of a car supported upon the rails.

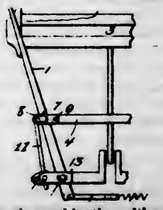
10. The combination of an inclined track, a truck running thereon and adapted to carry a car, truck-actuating means having a drive element disposed for engagement by one of the drive-wheels of a car upon the truck, and means to prevent the car from running off of the truck when the latter is in motion.

11. An elevator having track-rails, a guideway intersecting one of the rails, and a clutch working in the guideway for engagement with a car-wheel and capable of being shifted to one side of the rail to prevent the passage of car-wheels.

12. An elevator having track-rails, one of the rails having a transverse groove intersecting its tread, and a clutch shiftable into and out of the groove to engage a car-wheel and prevent movement thereof on the rail.

13. An elevator provided with means for driving the same which is controlled by a car supported upon the elevator.

813,417. LUG-STRAP ATTACHMENT. JOSEPH F. HARRINGTON, Killingly, Conn. Filed July 6, 1904. Serial No. 215,477.



Claim.—1. In a loom, the combination with a lug-strap of flexible material and an ordinary rocker, of an arm attached to the inner end of the flexible lug-strap and extending outwardly beyond the picker-stick, and a link pivotally connected with the outer end of the arm and extending outside the picker-stick to and pivotally connected with the rocker, substantially as specified.

2. In a loom, in combination, a lug-strap of flexible material, an ordinary rocker, an arm attached to the inner end of the flexible lug-strap and extending outwardly beyond the picker-stick, and an adjustable link pivotally connected with the outer end of the arm and extending outside of the picker-stick to and pivotally connected with the rocker, substantially as specified.

3. A lug-strap support having an arm adapted to be attached to the inner end of and to extend outwardly beyond the outer end of the ordinary flexible lug-strap, an arm adapted to be connected with and to extend outwardly beyond the ordinary rocker, and a link connecting the lug-strap arm with the rocker-arm outside the picker-stick, substantially as specified.

4. A lug-strap support having an arm adapted to be attached to the inner end of and to extend outwardly beyond the outer end of the ordinary flexible lug-strap, an arm adapted to be adjustably connected with and to extend outwardly beyond the ordinary rocker, and a link connecting the lug-strap arm with the rocker-arm outside of the picker-stick, substantially as specified.

5. A lug-strap support having an arm adapted to be attached to the inner end of and to extend outwardly beyond the outer end of the ordinary flexible lug-strap, an arm adapted to be connected with and to extend outwardly beyond the ordinary rocker, and an adjustable link connecting the lug-strap arm with the rocker-arm outside of the picker-stick, substantially as specified.

6. A lug-strap support having an arm adapted to be attached to the inner end of and to extend outwardly beyond the outer end of the ordinary flexible lug-strap, an arm adapted to be connected with and to extend outwardly beyond the ordinary rocker, and a link pivoted to one arm and adjustably connected with the other arm outside of the picker-stick, substantially as specified.

7. A lug-strap support having an arm with a bolt-hole and prongs whereby it may be connected with the inner end of and may extend outwardly beyond the outer end of the ordinary flexible lug-strap, an arm with a bolt-hole whereby it may be connected with and extend outwardly beyond the ordinary rocker, and a link pivoted to one arm and adjustably connected with the other arm outside of the picker-stick, substantially as specified.

8. A lug-strap support having an arm adapted to be attached to the inner end of and to extend outwardly beyond the outer end of the ordinary flexible lug-strap, an arm adapted to be adjustably connected with and to extend outwardly beyond the ordinary rocker, and a link pivoted to one arm and adjustably connected with the other arm outside the picker-stick, substantially as specified.

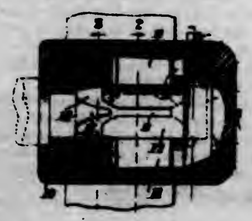
9. A lug-strap support having an arm adapted to be attached to the ordinary flexible lug-strap, an arm adapted to be connected with the ordinary rocker, a lock-plate connected with one arm, a link connected with the other arm and extending through the lock-plate, the lock-plate and link having an engaging stud and teeth, and a spring for normally holding the stud engaged with the teeth, substantially as specified.

10. A lug-strap support having an arm adapted to be attached to the ordinary flexible lug-strap, an arm adapted to be connected with the pivot of the picker-staff, a lock-plate connected with the latter arm and provided with a stud and a spring, and a link pivoted to the lug-arm and extending through the lock-plate and provided with teeth that are adapted to engage the stud on the lock-plate, substantially as specified.

11. A lug-strap support having an arm adapted to be attached to the ordinary flexible lug-strap, an arm adapted to be fastened to the ordinary rocker, a lock-plate connected with one arm, a link connected with the other arm and adapted to be connected with the lock-plate, and a spring for normally holding the lock-plate and link together, substantially as specified.

12. The combination of a picker-staff, a sweep-stick, a flexible lug-strap attached to the sweep-stick and embracing the picker-staff, a rocker, an arm connected with and extending outwardly from the flexible lug-strap beyond the picker-stick, and a link pivotally connected with the outer end of the arm outside the picker-stick and adjustably connected with the rocker outside of the picker-stick, substantially as specified.

813,418. **HUB FOR CAR-WHEELS.** DODSON HAMLET, Grafton, W. Va. Filed Aug. 31, 1905. Serial No. 276,698.

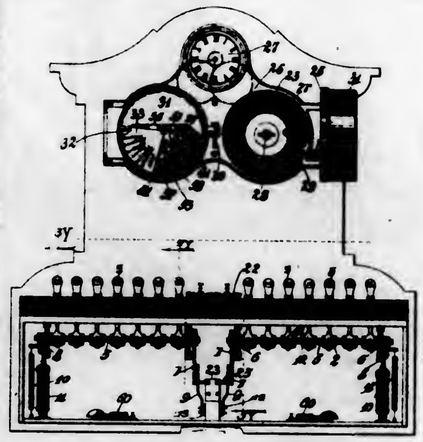


Claim.—1. A self-oiling wheel-hub provided with a plurality of oil-ducts leading radially from the spindle-bearing with the outer sides inclined toward one end of the hub, an oil-receptacle at one end of the hub and communicating with the smaller ends of said ducts, and an oil-chamber at the other end of the hub extending entirely around the spindle-bearing and communicating with the larger ends of said ducts.

2. A self-oiling wheel-hub provided with a plurality of oil-ducts leading radially from the spindle-bearing, an oil-receptacle at one end of the hub communicating with one end of said ducts, an oil-chamber at the other end of the hub communicating with the other end of said ducts, and V-shaped division-webs in said chamber disposed with their outer ends opposite said ducts and directing the oil into the same.

3. A self-oiling wheel-hub provided with a plurality of oil-ducts leading radially from the spindle-bearing and with their side walls diverging at the ends, an oil-receptacle at one end of the hub and communicating with said ducts at one end, an oil-chamber at the other end of the hub communicating with the other ends of said ducts and V-shaped division-webs in said chamber disposed with their smaller ends within the adjacent enlarged ends of said ducts.

813,419. **SELECTIVE SIGNALING SYSTEM.** CHARLES G. HAWLEY and HERBERT O. HOLDERMANN, Chicago, Ill. Filed Dec. 15, 1903. Serial No. 185,246.



Claim.—1. In an electric signaling system, a signal-circuit and a release-circuit, in combination with signaling and releasing devices arranged in pairs at distant points or stations on said circuits, means for actuating the signaling and releasing devices of each station from the other station, and means at each station preventing the operation of its signaling and releasing means during the actuation of the corresponding device at the other station, substantially as described.

2. In an electric signaling system, a signal-circuit and a release-circuit, in combination with electric signal-display means and signal-releasing means at distant stations and connected respectively with said signal and release circuits, suitable impulse-transmitting means upon each of said circuits at each station, and means preventing the actuation of the release impulse means at one station from the other, during the transmission of impulses from the latter to the first station, substantially as described.

3. In an electric signaling system, a signaling-circuit connecting distant stations, in combination with electromagnetic signal-display means at each station, a suitable switch at each station normally connecting the signaling means thereof in circuit, a suitable source of electricity at each station and normally disconnected from said circuit, and a plurality of electric contacts connected with each source of electric energy, for engagement by the respective switch during the disconnection of the latter from its respective signal-display means, substantially as described.

4. A signal apparatus, comprising electromagnetic signal-display means, in combination with an electric switch comprising a plurality of contacts and a movable member, an electric circuit normally

including said movable member and said signal-display means, and a suitable source of electricity connected with said contacts, and means for imparting different degrees of movement to said movable member, for the transmission of electric impulses to said circuit, substantially as described.

5. In an electric signaling system, a signaling-circuit and a releasing-circuit, connecting distant stations, in combination with electromagnetic signal-display means at said stations, an electric switch at each station having a movable member normally completing the circuit of the respective signal-display means, electromagnetic signal-releasing means at each station, the movable switch member of each station normally completing the circuit of the respective release means, suitable sources of energy in said circuits, means for causing electric impulses upon said releasing-circuit, and a plurality of contacts provided in connection with each of said movable members, for cooperation therewith, to send impulses upon said signaling-circuit, substantially as described.

6. In an electric signaling system, signal and release circuits connecting distant stations, in combination with electromagnetic signal-display means normally connected with said signal-circuit at each station, signal-releasing means normally connected with said release-circuit at each station, an electric signaling-switch at each station, for transmitting impulses to the signal means at the other station, and means at each station whereby, by the actuation of the signaling means, the releasing means of the other station will be actuated in advance of the signal-display means at the latter station, substantially as described.

7. In a signaling apparatus, a suitable electric circuit containing pairs of signal-display and signal-releasing devices, in combination with a selective signaling switch or contact device for each said pair, energized branches of the circuit including said switches, a plurality of keys at each station, for operating its selective signaling-switch, and a release-circuit closer at each station, operable by any of the keys thereof, substantially as described.

8. In a signaling apparatus, an electromagnetic signal-display device, in combination with a selective impulse-switch or contact device in circuit therewith but distant therefrom, signal-releasing means, a signal-releasing key in circuit therewith but distant therefrom, a plurality of signaling-keys provided in connection with said selective signaling device, and means connected with said releasing-key for automatically releasing the distant releasing device on the operation of any one of said signaling-keys, substantially as described.

9. In an electric signaling apparatus, a movable signal-display member, in combination with a ratchet device, a lever bearing the pawl of said ratchet device, an armature-lever yieldingly connected to the pawl hereof, means limiting the movement of the pawl-lever, a contact for engagement by the armature-lever upon its separation from the pawl-lever, and an electromagnet for actuating said levers simultaneously, substantially as described.

10. In a signaling apparatus, a movable signal-display member, in combination with an electromagnetic device for actuating the same, a signal-registering mechanism having a movable member operated by and in time with said display member, and electromagnetic means for actuating said movable member after it is positioned by said display member to register the position assumed by the display member, substantially as described.

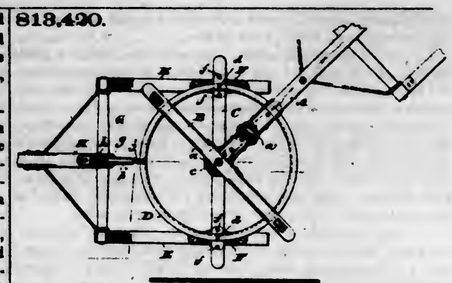
11. In a signaling apparatus, a movable display member, in combination with an electromagnetic step-by-step mechanism for operating said member, an electromagnetic punch to be energized by an extra movement of the electromagnetic mechanism, and a registering device having a member operable by said electromagnet and to which step-by-step movement is imparted by the movement of said display member, substantially as described.

12. In a signaling apparatus, a signal-display member, in combination with electromagnetic operating means therefor, capable of a normal and an extra movement, the circuit of said electromagnetic registering means, and an electromagnetic registering means included in a branch of said circuit and operable upon the extra movement of said operating means, substantially as described.

813,420. **BOB-SLEIGH.** PAUL W. RIBBARD, Jefferson, Wis. Filed June 24, 1905. Serial No. 266,769.

Claim.—In a front bob for sleighs, a metal ring secured to the cross-brace of said bob, a king-bolt supported in said cross-brace, and concentric with said ring, a tongue pivoted to said bob, and a tension-spring secured to the tongue and said metal ring, substantially as set forth.

813,420.



813,421. **NON-REFILLABLE BOTTLE.** WILLIAM J. HIGHAM, Denver, Colo. Filed June 19, 1905. Serial No. 265,951.

Claim.—1. In a non-refillable bottle, the combination with the bottle having a mouth, of the sleeve, secured in said mouth, having a liquid-outlet, a float arranged to control said outlet, introverted flukes in said sleeve arranged to form liquid-passages around said float, and a fluted cap having a liquid-outelt arranged in said sleeve to confine the operative movement of said float.

2. In a non-refillable bottle, the combination with the bottle, of the sleeve, the float adapted to control the outlet of the bottle, and the float-cap, having a liquid-outlet, with the conical valve, mounted on said cap, to control said liquid-outlet, a spider-cover in said sleeve over said valve arranged to control its operative movement, and means for confining said spider in said sleeve, as set forth.

3. In a non-refillable bottle, the combination of the bottle with the sleeve, the float adapted to control the outlet of the bottle, the float-cap, the conical valve, and the spider having a conical recess of greater angle, and area, than said valve, arranged to fit over said valve, with clearance-space enough to allow said valve operative movement within said spider's conical recess, arms on said spider arranged to form liquid-passages around said valve, a hub portion to said spider having a small axial aperture through it, and means including a stopper-holding cap arranged to be keyed in said bottle to confine said spider in operative relation to said valve, as set forth.

4. In a non-refillable bottle, the combination of the bottle having a neck having a mouth provided with a counterbore at its entrance, and having a circumferential keyway, with the sleeve seated in said counterbore and mouth, the float adapted to control the outlet of the bottle, the float-cap, and valve-seat, the conical valve, and the valve-cover in said sleeve, the stopper-cap, having a flange portion fitting the counterbore in said mouth, and provided with a circumferential keyway arranged to register opposite the keyway of said bottle's counterbore, the keys having spring-wings and arranged to be sprung into said keyway, as set forth.

5. In a non-refillable bottle, the combination with the bottle having a mouth, provided with a counterbore having a circumferential keyway, of a stopper-receiving cap, adapted to fit in said counterbore and containing a liquid-outlet, said stopper-cap having a circumferential keyway arranged to register with said keyway, in said counterbore, and a key having two spring-wings arranged and

adapted to be inserted in said registering keyways and lock said stopper-cap to said bottle, as set forth.

6. In a non-refillable bottle, the combination with the bottle having a mouth, provided with a counterbore having a circumferential keyway, of a stopper-receiving cap, adapted to fit in said counterbore and having a liquid-outlet, said stopper-cap having a circumferential keyway arranged to register with said keyway, in said counterbore, and a key having two spring-wings arranged and adapted to be inserted in said registering keyways and lock said stopper-cap to said bottle, said stopper-cap being provided with grooves in its peripheral edge leading into said keyways arranged and adapted to conduct a suitable cement into said keyways, as set forth.

7. In a non-refillable bottle, the combination of the bottle having a neck having a mouth provided with a counterbore, having a keyway, a stopper-cap filling said counterbore, having a keyway registering with the keyway in said counterbore, and keys, comprising crescent-shaped keys having spring-blades adapted to be compressed and placed in the keyway of said caps, while inserting said cap in said counterbore, and adapted to expand into the keyway of said counterbore when said keyways register with each other after said cap is inserted in its operative position in said counterbore, as set forth.

8. In a non-refillable bottle, the combination with a bottle provided with a neck having a mouth having a counterbore, keys in said counterbore, and a stopper-cap secured to said mouth by said keys, of a sleeve in said mouth, having a float-chamber, having a liquid-outlet aperture, a float in said float-chamber, a cap arranged to define the operative movement of said float, provided with an outlet-aperture, and a valve operatively arranged to control the outlet-aperture of said cap, substantially as described.

9. In a non-refillable bottle, the combination with the neck provided with a mouth and a counterbore at the entrance to the mouth, the sleeve, the float adapted to control the outlet of the bottle, the cap for defining the movement of said float, said sleeve and cap being provided with liquid-outlet apertures, with a conical valve seated on said float-cap, a winged-valve-holding hub arranged to confine said valve in operative relation to its seat, a stopper-cap in the mouth of said bottle, and means, including keys, for securing said stopper-cap in the mouth of said bottle, substantially as described.

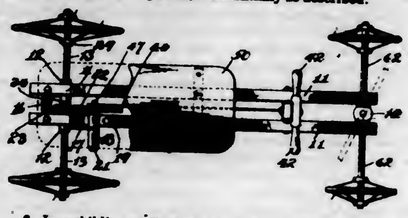
10. In a non-refillable bottle, the combination with the bottle, provided with a neck and mouth and having a circumferential keyway in the entrance to its mouth, a sleeve secured in the mouth of said bottle, provided with a liquid-outlet aperture and a float-chamber in its bottom, a circumferential row of introverted flukes in said float-chamber around its periphery, a float in the center of said flukes arranged to control said liquid-outlet, a cap containing a liquid-outlet aperture seated on said flukes in said float-chamber, a circumferential row of flukes in said cap adapted to prevent said float from approaching too near said cap-outlet, and to provide passages for said liquid around said float, a conical valve seated on said cap over said liquid-outlet, a spider-block arranged over said valve containing a beveled recess defined by the inner lower edges of said spider's guard-arms, and arranged and adapted to permit operative movement of said valve on its seat, said cap being provided with a small aperture registering opposite the apex of said valve, and means, including a stopper-receiving cap, secured in the mouth of said bottle, for confining said spider in operative relation to said valve, substantially as described.

11. In a non-refillable bottle, the combination of a bottle, a sleeve having a liquid-outlet secured in the mouth of said bottle, said sleeve also having a float-chamber, a float contained therein; a cap and flukes arranged to define the movement of float, and provided with a liquid-discharge aperture, a conical valve seated on said cap to control its liquid-outlet aperture, a spider arranged to operatively confine said valve to its seat, and means, including a stopper-holding cap and a keyway formed partially in said stopper-cap and in said bottle and suitable keys, for securing said spider in operative valve-controlling relation to said valve, substantially as described.

12. In a non-refillable bottle, the combination of the bottle having a keyway with the sleeve having a liquid-outlet aperture, the float in said sleeve arranged to control said outlet-aperture, and the float-cap having a liquid-outlet aperture, with the conical valve, the valve-confining spider, and the stopper-cap, having a keyway, registering opposite the keyway in said bottle, and the spring-keys arranged and adapted to said keyways, as set forth.

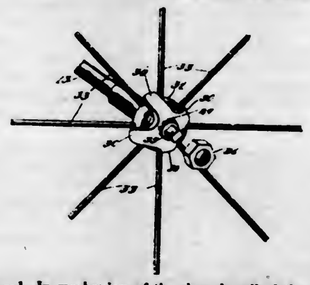
818,422. SELF-PROPELLED VEHICLE. HUGH HILL, Anderson, Ind., assignor to HH Standard Manufacturing Company, Anderson, Ind., a Corporation of Indiana. Filed Mar. 20, 1905. Serial No. 251,045.

Claim.—1. In a child's cart, the combination of a longitudinal girder or frame member 11, a bearing for the driving-axle secured upon the under side of said girder, a pinion mounted on the driving-axle in said bearing, another bearing for a supplemental gear-wheel mounted above the girder, and adjacent to the first-mentioned bearing, a gear journaled in said bearing meshing with the pinion, and struts 17 rigidly connecting the two bearings to insure accurate centering of the gear and pinion, substantially as described.



2. In a child's cart the combination of a longitudinal girder or frame member, a bearing for the driving-axle secured upon one side of said girder, a pinion mounted on the driving-axle in said bearing, another bearing for a supplemental gear-wheel mounted upon the opposite side of said girder and adjacent to the first-mentioned bearing, a gear journaled in said bearing meshing with the pinion, and a strut rigidly connecting the two bearings to insure accurate centering of the gear and pinion.

818,428. MECHANISM FOR CONNECTING VEHICLE-WHEELS TO AXLES. HUGH HILL, Anderson, Ind., assignor to HH Standard Manufacturing Company, Anderson, Ind., a Corporation of Indiana. Original application filed Mar. 20, 1905, Serial No. 251,045. Divided and this application filed Aug. 7, 1905. Serial No. 273,044.



Claim.—1. In mechanism of the class described the combination of an axle, a traction-wheel mounted thereon, claw-shaped clips rigidly secured upon the axle, having their claws or fingers over the outsides of hubs of the wheel and between the spokes thereof, for the purpose of rigidly securing the wheel to the axle substantially as described.

2. In a child's vehicle the combination of, an axle, a wire-spoked traction-wheel mounted thereon, claw-shaped clips 29 rigidly secured to the axle on opposite sides of the wheel the claws or fingers of the clips being folded over the hubs of the wheel and passing between the spokes to secure the wheel in rigid position upon the axle substantially as described.

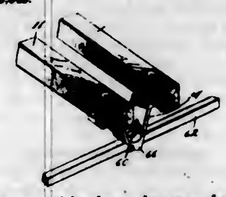
3. In a child's vehicle the combination, of an axle, a wire-spoked traction-wheel mounted thereon, claw-shaped clips 29 rigidly secured to the axle on opposite sides of the wheel, the claws or fingers of the clips being folded over the hubs of the wheel and passing between the spokes of the wheel the width of said fingers or clips being substantially the width of the spaces between successive spokes whereby the clips are adapted to secure the wheel in rigid position upon the axle substantially as described.

4. In mechanism of the class described, the combination of an axle a traction-wheel mounted thereon, a claw-shaped clip rigidly secured upon the axle having its claws or fingers over the outside of the hub of the wheel and extending between the spokes thereof.

5. As an article of manufacture for use in mechanism of the class described a clip 29 adapted to be secured to the axle having one or more fingers 30 of the form shown adapted to fit over the outside of the wheel-hub and pass between the spokes thereof.

6. In mechanism of the class described, the combination of an axle a traction-wheel mounted thereon a claw-shaped clip rigidly secured upon the axle having its claws or fingers bearing against the axle of the wheel fitting between the spokes of the wheel and occupying substantially the width of the spaces between the spokes whereby said clip is adapted to secure the wheel in rigid position upon the axle.

818,424. VEHICLE-AXLE MECHANISM. HUGH HILL, Anderson, Ind., assignor to HH Standard Manufacturing Company, Anderson, Ind., a Corporation of Indiana. Original application filed Mar. 20, 1905, Serial No. 251,045. Divided and this application filed Aug. 7, 1905. Serial No. 273,045.

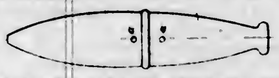


Claim.—1. As an article of manufacture, a front bolster for a child's vehicle made U-shaped as described, having one or more lugs extending downward from the bottom thereof adapted to limit the motion of the front axle of the vehicle to which the bolster is applied when said axle is pivotally attached to the bottom of the bolster.

2. As an article of manufacture, a front bolster for a child's vehicle, made U-shaped as described, having two lugs 66 extending downward from the bottom thereof, there being a space between the lugs lying in the center line of the vehicle in which the front axle of said vehicle is adapted to fit and be pivotally mounted on the bolster, substantially as described.

3. In combination, a vehicle-body and running-gear including wheels, front and rear axles and a bolster attached to the front of the vehicle-body and a pivot-pin, said bolster having depending lugs thereon forming stops for limiting the horizontal swing of the front axle, said lugs having substantially vertical acting surfaces and the acting surfaces on opposite sides of the axle-pivot being substantially parallel to each other, said front axle having a flat upper bearing-surface arranged substantially horizontal and having parallel vertical sides, and said bolster having a flat lower bearing-surface bearing directly upon the upper surface of said front axle thereby tending to maintain the axle sides vertical for squarely contacting the vertical acting surfaces of the stop-lugs, and the pivot-pin passing vertically through both bolster and axle to also assist in maintaining the axle sides vertical for squarely contacting the vertical acting surfaces of the stop-lugs.

818,425. INHALER AND EXHALER. JOHN L. HILL, Jackson, Mich., assignor to Forrest C. Bagley, Jackson, Mich. Filed June 27, 1904. Serial No. 214,204.



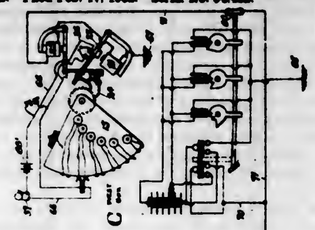
Claim.—1. In a device of the class described, the combination of a hollow inhaler member having inlet-ports in the walls thereof and internal screw-threads; a hollow exhaler member having a restricted delivery-port and internal screw-threads; a threaded coupling for said members adapted to seal their inner ends; a filling for said inhaler member adapted to receive a medicament; and a removable perforated partition for said inhaler member, for the purpose specified.

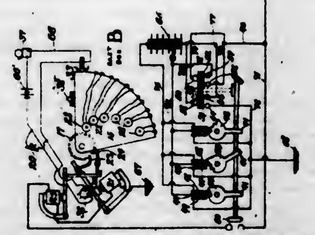
2. In a device of the class described, the combination of a hollow inhaler member having inlet-ports in the walls thereof and internal screw-threads; a hollow exhaler member having a restricted delivery-port and internal screw-threads; a threaded coupling for said members adapted to seal their inner ends; and a filling for said inhaler member adapted to receive a medicament, for the purpose specified.

3. In a device of the class described, the combination of a tubular inhaler member having a nasal tip at its outer end and inlet-ports at its inner end; a filling material therefor adapted to receive a medicament; an exhaler member having a mouthpiece at its outer end and a restricted delivery-port; and a coupling for the inner ends of said members, for the purpose specified.

4. In a device of the class described, the combination of an inhaler member having a nasal tip at its outer end and inlet-ports at its inner end, and a receptacle for medicament; an exhaler member having a mouthpiece at its outer end and a restricted delivery-port; and a coupling for the inner end of said members, for the purpose specified.

818,426. SIGNALING SYSTEM. HERBERT O. HOLDERMAN and CHARLES G. HAWLEY, Chicago, Ill., assignors, by direct and mesne assignments, to Rockable Signal Company, Chicago, Ill., a Corporation of Illinois. Filed Feb. 17, 1902. Serial No. 94,422.





Claim.—1. In a signal system, the plurality of stations each provided with a pair of signal-boxes and the boxes of adjacent stations being electrically connected, and each said box comprising means for the display of a plurality of fixed signals, electromagnetic means for actuating the same, electromagnetic means for returning or releasing the signals, a clock-operated registering-dial; electromagnetic registering means in connection with the different display-signals, and means for transmitting electrical impulses from one box to the electromagnetic devices in the box of the adjacent station, substantially as described.

2. In a signal system, the combination of the signal-dial provided with a plurality of display-signals with an electromagnetic device for operating said dial, a concentrically-arranged registering-disk suitably operated, and electromagnetic punches operable upon said registering-disk and controlled by the signal-dial, substantially as described.

3. In a signal system, the adjacent signal-stations each provided with a signal-box containing an electrically-operable signal-dial bearing a number of fixed signals in combination with electromagnetic punches carried by said dial, a registering device whereon said punches operate, a local circuit containing a source of energy for operating said punches, said dial governing the operation of said punches, an electromagnetically-actuated circuit-closer included in said local circuit, and impulse-sending keys in each box, electrically connected for actuating the dial of the other station, substantially as described.

4. In a signal system, the combination of a signal-dial bearing a plurality of fixed signals and a plurality of electrical contacts, a registering device, a plurality of electromagnetic record-making devices electrically connected with corresponding contacts upon said dial, stationary contacts, the electromagnetic device for operating said dial, a circuit-closer provided in connection therewith, an energized local circuit including said circuit-closer and said contact, dial-returning means, a plurality of impulse-sending keys, and a reversing-switch, and a suitably-energized electric circuit connecting the switches, keys, and electromagnetic devices of adjacent boxes, substantially as described.

5. In a signal system, the combination with a plural signal device and the electromagnetic operating means therefor, with electric

Claim.—1. In a device of the character described, the combina-

the casing, an inlet and an outlet for the flow of water, a ring of

818,480. PROPELLER. WILLIAM F. HUNTER, Arvada, Col., as-

5. In a signal system, the combination with a plural signal device and the electromagnetic operating means therefor, with electromagnetic releasing means, a plurality of impulse-sending keys, a reversing-key or pole-changer, an electric battery, a main circuit having two branches, one thereof including said electromagnetic means and the other including said battery, switch, and keys, and said circuit-breaker being operable by said switch and either of said keys, substantially as described.

6. The signal-box comprising a casing having a display-opening, a signal-dial movable in said box to successively display a plurality of signals, a concentric registering-disk, electromagnetic registering means, and electromagnetic means for operating said dial and controlling said registering means, substantially as described.

7. The signal-box comprising a casing, a dial movable therein, the electromagnetic device for operating said dial, a registering-disk, a plurality of registering devices controlled by said dial, a local circuit including contacts for completing the circuits of said devices as said dial is moved, prolonged circuit-closing means provided in connection with said circuit and dial, and means for closing said local circuit to permit the operation of said devices, substantially as described.

8. In a signal system, the adjacent signal-stations each comprising a signal-box having signal display and registering devices, the connecting-circuit, and means for transmitting weak and strong impulses from one station to the other for operating the signal-display devices and the registering device respectively, substantially as described.

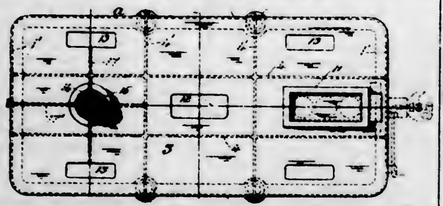
9. In a signal-box, the combination with the movable signal-dial, the concentric registering-disk continuously operated, electromagnetic means for operating said dial, a plurality of solenoids 28 carried by said dial each having a string-resisted core and a punch-point, a local circuit and circuit-closing means for completing said circuit through any one of said solenoids, substantially as described.

10. The signaling apparatus, comprising, in combination, a movable signal-display device, an electromagnetic motor for said device, an electric circuit containing a source of electricity, means for opening and closing said circuit to cause the operation of said device by said motor, a registering device movable with said signal device proper and made to operate upon the last movement of said motor at the end of each signaling period, substantially as described.

11. A signal system, having two stations, each equipped with a signaling apparatus comprising, in combination, a movable signal device, a single electromagnetic operator therefor, and a registering mechanism operable upon each last signaling movement of said device, electric circuits joining said stations and the impulse-keys whereby the signal-operator of each station is controlled from the other station, substantially as described.

12. In a registering device, the combination of the record-carrying mechanism with a visual movable signal, an electromagnetic operator thereof having a normally limited stroke armature, capable, however, of abnormal movement, a record-making device operated upon the abnormal movement of said armature, and electrical means for causing normal and abnormal movements of said armature, substantially as described.

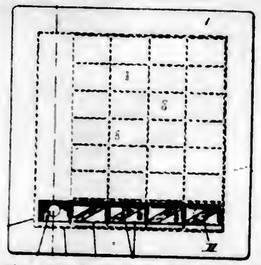
813,427. RAILROAD MOTOR-CAR. CLARENCE H. HOWARD, St. Louis, Mo. Filed Dec. 1, 1905. Serial No. 289,901.



Claim.—In a motor-car of the character described, the combination with a cast-steel wheel-frame integral throughout, of a floor supported by and integral with the said frame, a pocket in the floor adapted to receive a derrick-post, and ribs integral with the floor on its under side, the said ribs being united at their ends integrally to the said frame, substantially as described.

813,428. MAGAZINE DISPLAY-BASEL. JAMES H. HOUR, St. Louis, Mo. Filed May 28, 1903. Serial No. 261,746.

Claim.—1. In a device of the character described, the combination with a magazine of a face-plate therefor, said face-plate having a slot in its lower portion, and said face-plate overlapping the upper edges of the lowest horizontal row of minor packages contained in said magazine, and a flange forming part of said face-plate projecting upwardly above the lower floor of said magazine and overlapping the lower edges of said minor packages, and means in the nature of an opening facilitating the extraction of said minor packages from the said lower horizontal row.



2. In a device of the character described, the combination of a magazine and a face-plate therefor, said face-plate slightly overlapping the lowest horizontal row of minor packages contained in said magazine, said magazine being provided with an opening in its rear face for the insertion of a finger or other means to aid in the withdrawal of a minor package from the lowest horizontal row of minor packages in said magazine.

3. In a device of the character described, the combination of a face-plate having a slot in its lower portion, a magazine attached to the rear of said face-plate, said magazine having an opening in its rear wall, the lower floor of said magazine being wide enough to accommodate a single row of minor packages, and said magazine throughout being wide enough to accommodate but a single row from front to back of said minor packages, but said magazine being adapted to receive a plurality of vertical and horizontal rows of said minor packages, and said face-plate overlapping the upper and lower edges of the lowest horizontal row of minor packages within said magazine contained, and said opening in the rear wall of the magazine affording access for means, coöperating with means inserted through the slot in the face-plate, whereby an individual minor package may be raised above that portion of the face-plate which overlaps the lower edge thereof, and, thereupon, withdrawn from said magazine.

4. In a device of the character described, the combination, with a front portion having a slot in its lowest portion, of a box or magazine attached to same and on the back thereof, said magazine being a major package designed to hold minor packages, the lowest part of said front portion comprising a flange turned upwardly from the floor of the magazine, and said flange and said floor being formed integral with the back of the magazine and shaped by bending same, said flange and the upper side of said slot forming means to retain said minor packages within said major package, and the rear wall of said magazine containing an opening to assist in removing said minor packages from the retention of said means.

5. In a device of the described class, the combination of a display-card, a receptacle formed on the back of the card and having its rear wall apertured near the lower end of the receptacle, said card having a slot in its front wall above the lower end of the receptacle, and folding braces adapted to hold the card and receptacle in a raised position.

813,429. FILTER. WOLCOTT A. HULL, New York, N. Y. Filed Mar. 26, 1904. Renewed Aug. 11, 1905. Serial No. 273,846.

Claim.—1. In a filter the combination of a base, forming part of a filter-casing, provided with an upwardly-extending rim, a cylindric body also forming part of the casing and provided with a flange fitting within the rim of said base, a filtering substance arranged within

the casing, an inlet and an outlet for the flow of water, a ring of easily-compressible packing material surrounding the cylindric body and resting against the upper side of its flange, a ring surrounding the cylindric body above the packing material and also extending down outside the rim of the base and provided outside said rim with means for engaging it with said rim.

2. In a filter the combination of a base, forming part of a filter-casing, provided with an upwardly-extending rim, a cylindric body also forming part of the casing and provided with a flange fitting within the rim of said base, a filtering substance arranged within the casing, an inlet and an outlet for the flow of water, a ring of easily-compressible packing material surrounding the cylindric body and resting against the upper side of its flange, a ring surrounding the cylindric body above the packing material and also extending down outside the rim of the base and provided outside said rim with a screw-thread for engaging it with said rim.

3. In a filter the combination of a base, forming part of a filter-casing, provided with an upwardly-extending rim, a cylindric body also forming part of the casing and provided with a flange fitting within the rim of said base, a filtering substance arranged within the casing, an inlet and an outlet for the flow of water, a ring of easily-compressible packing material surrounding the cylindric body and resting against the upper side of its flange, a ring surrounding the cylindric body above the packing material and also extending down alongside the rim of the base and provided alongside said rim with means for engaging it with said rim.

4. In a filter the combination of a base, forming part of a filter-casing, provided with an upwardly-extending rim, a cylindric body also forming part of the casing and provided with a flange fitting within the rim of said base, a filtering substance arranged within the casing, an inlet and an outlet for the flow of water, a ring of easily-compressible packing material surrounding the cylindric body and resting against the upper side of its flange, a ring surrounding the cylindric body, adapted to compress the packing material, and provided with means for engaging it with the rim of the base.

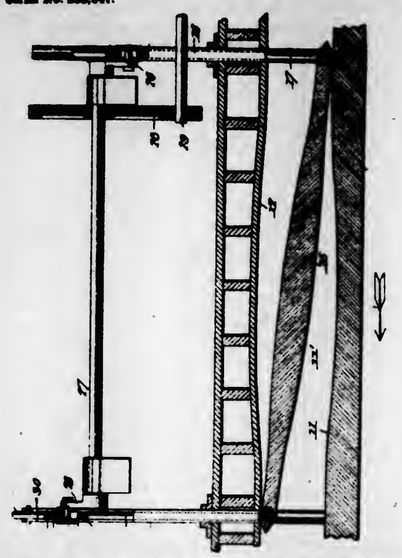
5. In a filter, the combination of a filter-casing comprising two separable parts coöperating with each other, a filtering substance arranged within the casing, an inlet and an outlet for the flow of water, a ring surrounding the casing and provided with means for connecting it to one of said parts of the casing, and easily-compressible packing material surrounding the casing and located between said ring and said other part of the casing.

6. In a filter the combination of a casing comprising two separable parts coöperating with each other, one part being provided with a rimmed flange and the other part with a flange adapted to fit within the rimmed flange of said first-named part, a filtering substance arranged within the casing, an inlet and an outlet for the flow of water, a ring surrounding the casing and provided with means for engaging it with the rim of said first-named part, easily-compressible packing material surrounding the casing and located between said ring and the flange of the other part of the casing.

7. In a filter, the combination of a base forming part of a casing and provided with a cavity which is wholly above the exterior bottom surface of said base and contracted so as to be smaller near the exterior surface than near the interior surface of said base, a body forming part of the casing, means for securing the base and body of the casing together, an inlet and an outlet for the flow of water, a filtering substance within the casing, a nozzle or conduit extending from the filtering substance, and packing material snugly fitting in the cavity in the base and wholly above the exterior bottom surface of the base, said packing material having the shape of a cork with a hole extending through it to snugly receive said nozzle or conduit.

8. In a filter, the combination of a base forming part of a casing and provided with a cavity which is wholly above the exterior bottom surface of said base and contracted so as to be smaller near the exterior surface than near the interior surface of said base, a body forming part of a casing, means for securing the base and body together, an inlet and an outlet for the flow of water, one of which consists of an orifice leading from said cavity, a filtering substance within the casing, a nozzle or conduit extending from the filtering substance, and a ring of packing material snugly fitting in the cavity in the base and wholly above the exterior bottom surface of the base, the hole in said ring of packing material being adapted to snugly receive said nozzle or conduit, and said ring of packing material being of such solidity and of such thickness between opposite faces that inserting the nozzle into the hole in the ring, forms a water-tight joint between the nozzle and the packing material and also operates to expand the packing material and thereby to insure a water-tight joint between it and the walls of the cavity.

813,430. PROPELLER. WILLIAM F. HOOVER, Arcata, Cal., assignor of one-half to Francis R. Herd, Arcata, Cal. Filed Apr. 14, 1905. Serial No. 255,047.



Claim.—1. The combination with a vessel having at the bottom an open-ended chamber, the upper and lower walls of which are arranged on oppositely-curved lines, respectively, a propeller-blade fitting within said chamber and having its upper and lower walls of a curvature corresponding to that of the walls of the chamber, and a propeller-operating means for moving the opposite ends of the blade alternately and for holding one end stationary, while the other end is moved to expel a volume of water from the chamber.

2. The combination with a vessel having a bottom chamber open at both ends, of a propeller-blade disposed within said chamber, vertically-disposed guides extending through the hull of the vessel and arranged to one side of the side walls of the chamber, rods extending through said guides, and connected to the propeller-blade, a crank-shaft, cranks thereon, cross-bars connecting the vertical bars in pairs and provided with dwell-faces that are engaged by said cranks, substantially as specified.

3. The combination with a vessel having a bottom chamber open at both ends, of a propeller-blade arranged within the chamber, hollow guide members extending through the hull of the vessel at points to one side of the side walls of the chamber, vertical bars mounted in said guides and connected to the propeller-blade, cross-bars connecting said vertical bars in pairs and provided with dwell-faces, a crank-shaft, cranks on said shaft, crank-pins arranged to engage the dwell-faces of the cross-bars, and adjustable antifriction-rollers carried by the cross-bars and engaging against the upper portions of the hollow guides.

813,431. DIVING APPARATUS. TAKAO IWAHASHI and MARK B. WOODWARD, Washington, D. C. Filed Oct. 11, 1905. Serial No. 282,285.

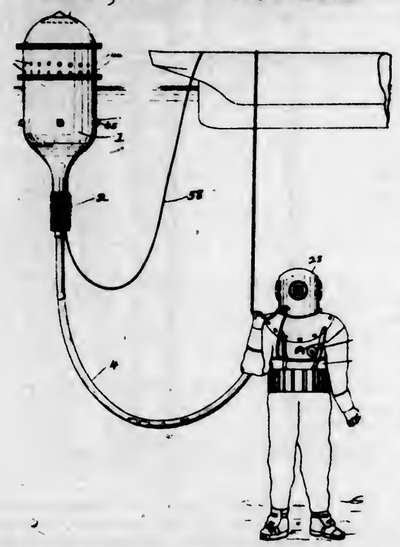
Claim.—1. In diving apparatus, a float, a diver's suit, and means contained in said float for supplying air to said suit comprising a source of air-supply independent of attendants arranged to furnish air at a pressure greater than that of the atmosphere, substantially as described.

2. In diving apparatus, a diver's suit, a float, a connection between said float and the diver's suit, and pumping means located in said float for furnishing a supply of air to the diver's suit, substantially as described.

3. In diving apparatus, a diver's suit, a float, a connection between said float and the diver's suit, and motor-driven means within said float for furnishing a supply of air to the diver's suit, substantially as described.

4. In diving apparatus, a float divided into compartments, one

compartment containing a motor-driven air-compressor and having a connection therefrom to the diver, and a connection from the other compartment to the diver whereby fresh air is delivered from one compartment to the diver and exhaled air from the diver exhausted through the other compartment, and means for permitting the escape of any water entering the float, substantially as described.



5. In diving apparatus, a float divided into compartments, one of said compartments having means for furnishing air to a diver, and another compartment near the top of the float having an opening near its top for admitting air and an opening for permitting the water to escape, and means of communication between said compartments, substantially as described.

6. In diving apparatus, a float divided into compartments, one of said compartments being located near the top of the float and having an opening to admit air and an opening near its bottom for permitting water to escape, and another of said compartments having means for supplying air to the diver and provided with a stack entering the upper compartment and having communication therein, substantially as described.

7. In diving apparatus, a float divided into compartments, one of said compartments being located near the top of the float and having an opening to admit air and an opening near its bottom for permitting water to escape, and another of said compartments having means for supplying air to the diver and provided with a stack entering the upper compartment and having communication therewith, and another compartment also connecting with the atmosphere and having the exhaust from the diver connected thereto, substantially as described.

8. In diving apparatus, a float divided into compartments, one of said compartments being located near the top of the float and having an opening to admit air and an opening near its bottom to permit water to escape, and another of said compartments having an air-compressor therein for supplying air to the diver, and an electric motor and a battery for operating said compressor, substantially as described.

9. In diving apparatus, a float for supplying air to a diver, means located within the float for supplying air to a diver, a hose connecting the float to the diver, and a universal joint between said float and said hose, substantially as described.

10. In diving apparatus, a float, a hose connecting said float with the diver's suit, and a universal joint between said float and said hose, said joint comprising a plurality of sections pivoted at right angles to each other and having a flexible covering, substantially as described.

11. In diving apparatus, means for supplying air to a diver, said means being governed by pressure of water surrounding the diver, substantially as described.

12. In diving apparatus, electrically-operated means for supplying air to the diver, and a device controlled by the pressure of water for governing said electrically-operated means, substantially as described.

13. In diving apparatus, electrically-operated means for supplying air to a diver, and a device controlled by the pressure of the water for governing said electrically-operated means, said device comprising a piston and a series of resistance-coils, substantially as described.

14. In diving apparatus, a float, a compressor located therein for supplying air to the diver, a motor for operating said compressor, and means on the diver's suit controlled by the pressure of the water for governing said motor, substantially as described.

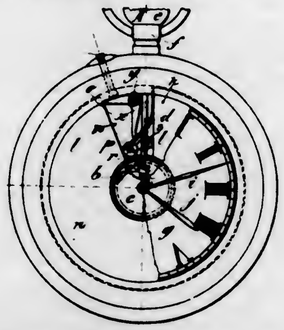
15. In diving apparatus, a float, a compressor located therein for supplying air to the diver, a motor for operating said compressor, and means on the diver's suit controlled by the pressure of the water for governing said motor, said means comprising a piston and a series of resistance-coils, substantially as described.

16. In diving apparatus, a float, a compressor contained in said float for supplying air to a diver, said float being provided with air-inlet openings and water-exit openings, and a pump for forcing water from the float out of said exit-openings, substantially as described.

17. In diving apparatus, a diver's suit, means for supplying air thereto, means for signaling the location of the diver comprising a flexible bulb located on said diver's suit, said bulb having a normally closed opening adapted to open when pressure is applied thereto, substantially as described.

18. In diving apparatus, a float, a connection between said float and a diver's suit, and means within the float, operating independantly of the attendants, for supplying air to the diver at a pressure greater than that of the atmosphere, substantially as described.

813,432. WATCH. SALVATOR JANNER, La Chaux-de-Fonds, Switzerland. Filed Jan. 23, 1905. Serial No. 243,073.



Claim.—1. A watch of the class described having a case provided with an apertured dial, a hinged back for said case, and an incandescent lamp secured to said hinged back in a manner to bring said lamp into register with the aperture of said dial when said back is closed.

2. A watch provided with a case, a dry-cell battery and an incandescent lamp located within said case, a spring-contact mounted on and connected with said battery, a reciprocating plunger, a bell-crank of insulating material whereby said spring may be engaged with the lamp to close circuit with the battery.

3. A watch of the class described having a case provided with an apertured dial of opaque material, a crystal provided with a deflecting-surface alined with said aperture, a hinged back for said case, and an incandescent lamp secured to said hinged back in a manner to bring said lamp into register with said aperture and deflecting-surface to deflect the rays of light on said dial.

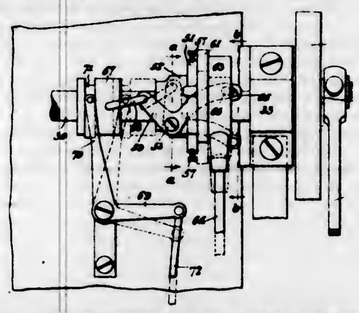
4. A watch of the class described having a case provided with an apertured dial, a hinged back for said case, and light-producing means secured to said hinged back in a manner to bring said means into register with the aperture when said case is closed.

5. A watch of the class described having a case provided with an apertured dial, a removable back for said case, and light-producing means secured to said back in a manner to bring said means into register with the aperture when said case is closed.

6. A watch of the class described provided with a case and operating works, a dry-cell battery surrounding said works and provided with a recessed or cut-away portion, a lamp projecting up within said recessed portion, and switch mechanism adjacent said lamp for closing circuit with said battery.

7. A watch of the class described provided with a case and an apertured dial, a battery secured in said case, a removable back for said case, a lamp secured to said back, switch mechanism for closing circuit with said lamp and battery, one part of said mechanism being of insulated material and being secured to the back, the remainder of said mechanism being secured to the case, said insulated part and said lamp being secured to the back in a manner to bring said parts into operative relation with the case mechanism and the aperture when said back is closed.

813,433. VALVE-GEAR. FRANK G. JOHNSON, Elkader, Iowa. Filed May 26, 1905. Serial No. 262,230.



Claim.—1. The combination of a shaft, a collar fixed thereon and provided with a slot and an eccentric peripheral portion, an eccentric embracing the shaft and pivoted upon the collar opposite the eccentric portion thereof, said eccentric having a hook slidably embracing the eccentric portion of the collar, and a lever fulcrumed upon the shaft and working in the slot of the collar in connection with the eccentric to shift the latter upon its pivotal support.

2. The combination of a shaft, a collar fixed thereon and provided with a slot, an eccentric embracing the shaft and pivotally supported upon the collar, a lever working in the slot of the collar in connection with the eccentric, and a set-screw piercing one end of the slot in the collar to limit the play of the lever.

3. The combination of a shaft, a collar fixed thereon and provided with a slot, limiting-screws piercing the opposite ends of the slot, an eccentric pivoted upon the collar, and a lever working in the slot in connection with the eccentric to shift the latter upon its pivotal support, the play of the lever being limited by the screws.

4. The combination of a shaft, a collar embracing the shaft and having a hub projected at one side of the collar and fixed to the shaft, the collar being provided with a slot and an eccentric peripheral portion, a lever fulcrumed upon the hub and working through the slot, and an eccentric pivoted upon the other side of the collar in connection with the lever and provided with a hook slidably embracing the eccentric portion of the collar.

813,434. STRAINER. LLEWELLYN W. JONES, Swoyersville, Pa. Filed May 9, 1905. Serial No. 259,542.

Claim.—1. A strainer or nozzle comprising top and bottom body portions, ribs rigidly connected to said top and bottom portions, said ribs having helically-arranged grooves therein, and a helix engaging said grooves and readily removable therefrom.

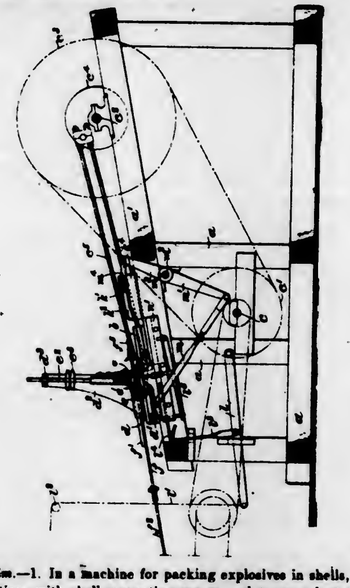
2. A strainer, or nozzle, comprising a body portion, or frame, a helix engaging said frame, and a stop on said frame adapted to engage said helix.

3. A strainer, or nozzle, comprising a body portion, or frame, a helix engaging said frame, and a pin in said frame adapted to engage the upper end of said helix.

4. A strainer, or nozzle, comprising a body portion, or frame, a helix engaging said frame, and means for cleaning the spaces between said helix in removing or applying same.

5. A strainer, or nozzle, comprising a body portion, or frame, a helix engaging said frame, and a projection on said frame adapted to enter the space between said helices.

813,435. CARTRIDGE-LOADING MACHINE. SIMEON B. KINNEY, Marquette, Mich., assignor to The E. I. Du Pont de Nemours Powder Company, Wilmington, Del., a Corporation of New Jersey. Filed Oct. 15, 1904. Serial No. 228,564.



Claim.—1. In a machine for packing explosives in shells, the combination, with shell-supporting means and tamps adapted to enter the shells, of a reciprocating carriage having roller-channels, said channels being curved for at least a part of their length, weighted rollers in said channels, and means enabling the rollers to operate the tamps, the weighted rollers forcing the tamps forwardly with a yielding pressure, as the carriage moves forwardly, substantially as described.

2. In a machine for packing explosives in shells, the combination, with shell-supporting means and tamps, of a plunger connected with each tamp, a tension device for each plunger and acting at an angle thereto, a roller-case for each plunger, said roller-case having a continuous channel curved for at least a part of its length, rollers in said channel acting upon said plunger and acted upon by said tension device, and means to reciprocate the roller-cases.

3. In a machine for packing explosives in shells, the combination, with shell-supporting means and tamps, of roller-cases each having a continuous channel, a portion of which is vertical, while another portion extends at an angle to the vertical, rollers adapted to traverse the channel, presser-rods entering the vertical portions of the channels, plungers connected with the tamps, entering the other portions of the channels, each set of rollers being thus confined between a presser-rod and a plunger, and means to reciprocate the roller-cases, thereby causing the tamps to enter the shells and pack the explosive therein with a yielding pressure, substantially as described.

4. In a machine for packing explosive shells, the combination, with shell-supporting means and tamps, of a carriage, means to reciprocate the carriage, roller-cases supported on the carriage, each roller-case having a continuous channel a portion of which is vertical while another portion extends toward the shell-supporting means, rollers within the channel and adapted to move back and forth therein, presser-rods entering the vertical portions of the channels and en-

gaging the rollers therein, plungers entering the other portions of the channels and engaging the rollers therein, and rods connecting the plungers with the tamps, substantially as described.

4. In a machine for packing explosives in shells, the combination, with shell-supporting means and tamps adapted to enter the shells, of a reciprocating carriage having roller-channels, said channels being curved for at least a part of their length, weighted rollers in said channels, and means enabling the rollers to operate the tamps, the weighted rollers forcing the tamps forwardly with a yielding pressure, as the carriage moves forwardly, substantially as described.

5. In a machine for packing explosives in shells, the combination, with shell-supporting means and tamps, of a plunger connected with each tamp, a tension device for each plunger and acting at an angle thereto, a roller-case for each plunger, said roller-case having a continuous channel curved for at least a part of its length, rollers in said channel acting upon said plunger and acted upon by said tension device, and means to reciprocate the roller-cases.

6. In a machine for packing explosives in shells, the combination, with shell-supporting means and tamps, of roller-cases each having a continuous channel, a portion of which is vertical, while another portion extends at an angle to the vertical, rollers adapted to traverse the channel, presser-rods entering the vertical portions of the channels, plungers connected with the tamps, entering the other portions of the channels, each set of rollers being thus confined between a presser-rod and a plunger, and means to reciprocate the roller-cases, thereby causing the tamps to enter the shells and pack the explosive therein with a yielding pressure, substantially as described.

7. In a machine for packing explosive shells, the combination, with shell-supporting means and tamps, of a carriage, means to reciprocate the carriage, roller-cases supported on the carriage, each roller-case having a continuous channel a portion of which is vertical while another portion extends toward the shell-supporting means, rollers within the channel and adapted to move back and forth therein, presser-rods entering the vertical portions of the channels and engaging the rollers therein, plungers entering the other portions of the channels and engaging the rollers therein, and rods connecting the plungers with the tamps, substantially as described.

8. In a machine for packing explosive shells, the combination, with shell-supporting means and tamps, of a carriage, means to reciprocate the carriage, roller-cases supported on the carriage, each roller-case having a continuous channel a portion of which is vertical while another portion extends toward the shell-supporting means, rollers within the channel and adapted to move back and forth therein, presser-rods entering the vertical portions of the channels and engaging the rollers therein, plungers entering the other portions of the channels and engaging the rollers therein, rods connecting the plungers with the tamps, a lock adapted to engage each plunger when the latter is moved to its extreme retracted position after each loading action, a lock adapted to engage each plunger when the latter is moved to its extreme retracted position after each loading action, and means to operate the locks, substantially as described.

9. In a machine for packing explosive shells, the combination, with shell-supporting means and tamps, of a carriage, means to reciprocate the carriage, roller-cases supported on the carriage, each roller-case having a continuous channel a portion of which is vertical while another portion extends toward the shell-supporting means, rollers within the channel and adapted to move back and forth therein, presser-rods entering the vertical portions of the channels and engaging the rollers therein, plungers entering the other portions of the channels and engaging the rollers therein, rods connecting the plungers with the tamps, a lock adapted to engage each plunger when the latter is moved to its extreme retracted position after each loading action, a lock adapted to engage each plunger when the latter is moved to its extreme retracted position after each loading action, and means to operate the locks, said means comprising a rider adapted to engage the locks when operated to move the lock into position to unlock all the tamps, a guide in which said block slides, a pin on said block adapted to

when operated to move the lock into position to unlock all the tamps, a guide in which said block slides, a pin on said block adapted to operation is completed, said rider being adapted to disengage said

gaging the rollers therein, plungers entering the other portions of the channels and engaging the rollers therein, and rods connecting the plungers with the tamps, substantially as described.

5. In a machine for packing explosives in shells, the combination, with shell-supporting means and tamps adapted to enter the shells, of reciprocating means to project the tamps into the shells including yielding pressure devices adapted to permit the tamps to be retracted by the explosive packed thereby, and locks adapted to hold the tamps in their retracted position after each loading action of the tamps, substantially as described.

6. In a machine for packing explosives in shells, the combination with shell-supporting means and tamps adapted to enter the shells, of reciprocating means to project the tamps into the shells including yielding pressure devices adapted to permit the tamps to be retracted by the explosive packed thereby, a lock adapted to hold each tamp in its retracted position after each loading action, a lock adapted to hold each tamp out of operation after the loading of its corresponding shell is completed, and means to unlock the tamps.

7. In a machine for packing explosives in shells, the combination, with shell-supporting means and tamps adapted to enter the shells, of a carriage, yielding pressure devices supported on the carriage but capable of independent movement relative thereto, connecting means between said yielding pressure devices and the tamps, means to reciprocate the carriage thereby projecting the tamps into the shell with a yielding pressure and causing the explosive packed therein to retract the tamps relatively to the carriage, and locks adapted to hold the tamps in their retracted positions after each loading action of the tamps, substantially as described.

8. In a machine for packing explosives in shells, the combination, with shell-supporting means and tamps, of a plunger connected with each tamp, a tension device for each plunger and acting at an angle thereto, roller-cases for the plungers, said roller-cases having continuous channels curved for at least a part of their length, riders secured to and forming part of the plungers and extending within the portion of the roller-channels adjacent to the plungers, and rollers in the channels engaging said riders.

9. In a machine for packing explosives in shells, the combination, with shell-supporting means and tamps, of a plunger connected with each tamp, a tension device for each plunger and acting at an angle thereto, roller-cases for the plungers, said roller-cases having continuous channels curved for at least a part of their length, riders secured to and forming part of the plungers and extending within the portion of the roller-channels adjacent to the plungers, rollers in the channels engaging said riders, locks adapted when in operative position to engage and hold the plungers in their retracted position after each loading action of the tamps, said locks being in line of travel of said riders and adapted to be engaged by said riders when the plungers are retracted to a determinate extent and move said locks into inoperative position.

10. In a machine for packing explosives in shells, the combination, with shell-supporting means, tamps and plungers connected with the tamps, of a reciprocating carriage, yielding pressure devices supported on the carriage but capable of independent movement relative thereto and adapted to actuate the plungers as the carriage moves forwardly, a lock for each plunger adapted to hold the plunger in its retracted position after each loading action, and a lock adapted to engage each plunger when the latter is moved to its extreme retracted position after the loading of the shell is completed and hold said plunger out of operation during the subsequent reciprocations of the carriage, substantially as described.

11. In a machine for packing explosives in shells, the combination with shell-supporting means and tamps, of plungers connected with the tamps, rollers, roller-cases, each having a channel for the reception of the rollers and an orifice through which said plunger extends, said plunger also extending within the roller-channel and engaged by said rollers, tension devices engaging the rollers in the channels and causing them to press against the plungers, and means to reciprocate the roller-cases thereby causing the tamps to enter the shells and, together with the plungers, to be retracted relatively to the roller-cases, a lock adapted to hold the plungers in their retracted positions after each loading action of the tamps, and a dogging-bar adapted to engage and hold each plunger out of operation after the loading of its corresponding shell is completed, substantially as described.

12. In a machine for packing explosives in shells, the combination, with shell-supporting means, tamps and plungers connected with the tamps, of a reciprocating carriage, yielding pressure devices supported on the carriage but capable of independent movement relative thereto and adapted to actuate the plungers as the carriage moves forwardly, a lock for each plunger adapted to hold the plunger in its retracted position after each loading action, a lock adapted to engage each plunger when the latter is moved to its extreme retracted position after the loading of the shell is completed and hold said plunger out of operation during the subsequent reciprocations of the carriage, and unlocking means on each plunger adapted to disengage the first-named lock from the plunger when the plunger's engagement with the last-named lock is effected, substantially as described.

13. In a machine for packing explosives in shells, the combination, with shell-supporting means, tamps, plungers connected with the tamps, of a carriage, means to reciprocate the carriage, roller-cases supported on the carriage, each roller-case having an orifice through which the plunger extends, and also a roller-channel, rollers within the channel, tension devices engaging said rollers, a rider secured to and forming part of each plunger and extending within the roller-channel, the upper face of the plunger being transversely grooved, a latch adapted to engage each plunger and hold it from moving forwardly relative to the carriage after it is retracted at the end of each loading action, a dogging-bar adapted to engage and hold each plunger out of operation after its loading operation is completed, said rider being arranged to disengage said latch from the plunger when the latter's engagement with the dogging-bar is effected, and a spring-pressed catch adapted to hold the disengaged latch out of operation, substantially as described.

14. In a machine for packing explosives in shells, the combination, with shell-supporting means, tamps, and plungers connected with the tamps, a reciprocating carriage, yielding pressure devices on the carriage adapted to actuate the plungers as the carriage moves forwardly, a lock adapted to hold each plunger out of operation when the loading of its corresponding shell is completed, a normally stationary sliding block, connections therefrom to the lock, and means to operatively engage said block with the carriage, thereby sliding said block and operating the lock to unlock all the plungers, substantially as described.

15. In a machine for packing explosives in shells, the combination, with shell-supporting means and tamps, of a reciprocating carriage, yielding pressure devices on the carriage adapted to actuate the tamps, a lock adapted to hold each tamp out of operation when the loading of its corresponding shell is completed, a normally stationary sliding block, connections therefrom to the lock, a pin on said block adapted to engage said carriage, a spring normally holding said pin out of engagement with said carriage, and means to move the pin into engagement with the carriage, thereby causing the latter to actuate the block and operate the lock to unlock all the tamps, substantially as described.

16. In a machine for packing explosives in shells, the combination, with shell-supporting means and tamps, of a reciprocating carriage, yielding pressure devices on the carriage adapted to actuate the tamps, a lock adapted to hold each tamp out of operation when the loading of its corresponding shell is completed, a normally stationary sliding block, connections therefrom to the lock adapted when operated to move the lock into position to unlock all the tamps, a guide in which said block slides, a pin on said block adapted to engage said carriage, a spring normally holding said pin out of engagement with said carriage and into engagement with a recess in said guide, and means to move the pin out of engagement with the guide and into engagement with the carriage, thereby causing the block to move with the carriage and operating the connections to the lock, substantially as described.

17. In a machine for packing explosives in shells, the combination, with shell-supporting means and tamps, of a reciprocating carriage, yielding pressure devices on the carriage adapted to actuate the tamps, a lock adapted to hold each tamp out of operation when the loading of its corresponding shell is completed, a normally stationary sliding block, connections therefrom to the lock, a lever, means for moving the same, an arm secured to said lever, a second lever pivoted on the block and adapted to be operated by said arm when the first lever is operated, a stationary guide in which said block slides, a third lever pivoted thereon, a connection therefrom to the second lever whereby the second lever operates the third lever, and means actuated by the third lever to cause said block to engage with said carriage, whereby the carriage, through the block and connections, operates the lock to unlock all the tamps, substantially as described.

18. In a machine for packing explosives in shells, the combination, with shell-supporting means and tamps, of a reciprocating carriage, yielding pressure devices on the carriage adapted to actuate the tamps, a lock adapted to hold each tamp out of operation when the loading of its corresponding shell is completed, a normally stationary sliding block, connections therefrom to the lock adapted

when operated to move the lock into position to unlock all the tamps, a guide in which said block slides, a pin on said block adapted to engage said carriage, a spring normally holding said pin out of engagement with said carriage and into engagement with a recess in said guide, a lever, means for moving the same, an arm on said lever, a second lever pivoted to the block and adapted to be operated by said arm, a third lever pivoted on the guide, a connection from the second lever to the third lever, and a pin on the third lever adapted to engage the pin in the block and move it out of engagement with the guide and into engagement with the carriage, substantially as described.

19. In a machine for packing explosives in shells, the combination, with shell-supporting means, tamps and plungers connected with the tamps, of a reciprocating carriage, yielding pressure devices on the carriage adapted to actuate the plungers as the carriage moves forwardly, a dogging-bar adapted to engage and hold each plunger out of operation when the loading of its corresponding shell is completed, a guide along which said dogging-bar is adapted to move out of locking position, and means to move said dogging-bar along the guide, thereby unlocking all the plungers, substantially as described.

20. In a machine for packing explosives in shells, the combination, with shell-supporting means, tamps and plungers connected with the tamps, of a reciprocating carriage, yielding pressure devices on the carriage adapted to actuate the plungers as the carriage moves forwardly, and normally stationary means engaging and holding each plunger out of operation when the loading of its corresponding shell is completed and movable to unlock the plungers and return them to operative position, substantially as described.

21. In a machine for packing explosives in shells, the combination, with shell-supporting means, tamps and plungers, having hooked rear ends, connected at their forward ends with the tamps, of a reciprocating carriage, yielding pressure devices adapted to actuate the plungers as the carriage moves forwardly, a dogging-bar having a lip with which the hooked rear end of each plunger engages when the loading of its corresponding shell is completed and a rear wall, and means to move said dogging-bar forwardly and downwardly, thereby simultaneously unlocking said plungers and pushing them into their initial operative positions, substantially as described.

22. In a machine for packing explosives in shells, the combination, with shell-supporting means, tamps and plungers having hooked rear ends, connected at their forward ends with the tamps, of a reciprocating carriage, yielding pressure devices adapted to actuate the plungers as the carriage moves forwardly, a guide having grooves extending generally in the direction of extension of the plungers but whose forward end dips downwardly, a dogging-bar, rollers thereon slidable in said grooves, said dogging-bar having a lip with which the hooked rear end of each plunger engages when the loading of its corresponding shell is completed and a rear wall, and means to move said dogging-bar forwardly, thereby restoring the plungers to their operative position and unlocking them, substantially as described.

23. In a machine for packing explosives in shells, the combination, with shell-supporting means, tamps and plungers connected with the tamps, of a reciprocating carriage, yielding pressure devices supported on the carriage and adapted to actuate the plungers as the carriage moves forward, a lock for each plunger adapted to hold the plunger in its retracted position after each loading action, a lock adapted to engage each plunger when the latter is moved to its extreme retracted position after the loading of the shell is completed and hold said plunger out of operation during the subsequent reciprocation of the carriage, unlocking means to disengage the first-named lock from the plunger when the plunger's engagement with the last-named lock is effected, and means to disengage the last-named lock from, and reengage the first-named lock with, all the plungers, substantially as described.

24. In a machine for packing explosives in shells, the combination, with shell-supporting means, tamps, plungers connected with the tamps, of a carriage, means to reciprocate the carriage, roller-cases supported on the carriage, each roller-case having an orifice through which the plunger extends and also a roller-channel, rollers within the channel, tension devices engaging said rollers, a rider secured to and forming part of each plunger and extending within the roller-channel, the upper face of the plunger being transversely grooved, a latch adapted to engage each plunger and hold it from moving forwardly relative to the carriage after it is retracted at the end of each loading action, a normally stationary dogging-bar adapted to engage and hold each plunger out of operation after its loading operation is completed, said rider being adapted to disengage said latch from the plunger when the latter's engagement with the dogging-bar is effected, a catch adapted to hold the disengaged latch out of operation, means to move the dogging-bar forwardly and downwardly, thereby undogging all the plungers and restoring them to their initial operative position, and a device on each plunger adapted, in the forward movement of the plunger, to disengage the latch from the clutch, substantially as described.

25. In a machine for packing explosives in shells, the combination, with shell-supporting means and tamps adapted to enter the shells, of plungers, means to reciprocate the plungers, and intermediate rods between the plungers and tamps, each of which is movable to connect one of the tamps with one of a plurality of plungers, whereby shells of different sizes may be loaded, substantially as described.

26. In a machine for packing explosives in shells, the combination with shell-supporting means and tamps adapted to enter the shells, of a carriage and operating means therefor, yielding pressure devices supported on the carriage but capable of independent movement relative thereto, plungers actuated by the yielding pressure devices, and flexible rods each of which is adapted to connect one of the tamps with one of a plurality of plungers.

27. In a machine for packing explosives in shells, the combination of the tamps, the plungers and the flexible rods attached to the front ends of the plungers and jointed to the rear ends of the tamps, substantially as described.

28. In a machine for packing explosives in shells, the combination, with plungers, means to reciprocate the plungers, and tamp-actuating rods connected with the plungers and movable to connect with tamps more or less offset with relation to the plungers.

29. In a machine for packing explosives in shells, the combination, with plungers, means to reciprocate the plungers, and tamp-actuating rods connected with the plungers, said rods having a limited flexibility whereby they may be connected with tamps spaced at different distances apart and some or all of which are more or less offset with relation to the plungers.

30. In a machine for packing explosives in shells, the reciprocating roller-cases, each of which contains a channel having a vertical end portion, an end portion at an angle to the vertical portion and a curved portion connecting the end portions, rollers movable in the channel, weighted presser-rods inserted in the vertical portion of the channel and bearing upon the rollers, tamp-actuating plungers extending into the other end portion of the channel, and tamps connected with the plungers, whereby the tamps when in action are each at all times subjected to a uniform pressure, substantially as described.

31. In a machine for packing explosives in shells, the L-shaped dogging-bar having a lip at the forward end of one member, combined with the independently-actuated plungers having hooked rear ends, whereby the dogging-bar, when stationary, holds the plungers inoperative when the latter are retracted, means for moving the dogging-bar forwardly, thereby causing the other member of the dogging-bar to push said plungers into operative position, and a forwardly-extending guide having a downwardly-extending front end which, in its forward movement, the dogging-bar engages and which determines the direction of movement of the dogging-bar when the latter is actuated, substantially as described.

32. In a machine for packing explosives in shells, in combination, the reciprocating plungers, yielding pressure devices engaging the plungers, means for moving the yielding pressure devices forwardly thereby actuating the plungers, a latch normally adapted to engage the plunger and lock it from moving forwardly, relatively to the yielding pressure devices, a locking member on each plunger, a dogging-bar common to all the plungers and adapted to engage the locking members thereof when the same has been retracted and hold the plungers inoperative, a rider on each plunger adapted when the plunger has been retracted to disengage the latch from the plunger, and a latch-unlocking device on each plunger adapted, when the plunger is restored to its operative position, to restore the latch to its normal position.

33. In a machine for packing explosives in shells, in combination, the reciprocating plungers, a rider on each plunger, yielding pressure devices engaging the rider, means for moving the yielding pressure devices forwardly thereby through the riders actuating the plungers, a latch normally adapted to engage the plunger and lock it from moving forwardly relatively to the yielding pressure devices but adapted to be disengaged from the plunger by the rider when the plunger is retracted a determinate distance, a catch adapted to engage the disengaged latch, and an unlocking device on each

plunger adapted when the plunger is moved forwardly from its retracted position to disengage the latch from the catch.

34. In a machine for packing explosives in shells, in combination, the reciprocating plungers, a rider on each plunger, yielding pressure devices engaging the rider, means for moving the yielding pressure devices forwardly thereby through the riders actuating the plungers, a latch normally adapted to engage the plunger and lock it from moving forwardly relatively to the yielding pressure devices but adapted to be disengaged from the plunger by the rider when the plunger is retracted a determinate distance, a dogging-bar adapted to successively hold all the retracted plungers inoperative and also move them forwardly into operative position, means to actuate the dogging-bar, a catch adapted to engage the disengaged latch, and an unlocking device on each plunger adapted when the plunger is moved forwardly from its retracted position to disengage the latch from the catch.

35. In a machine for packing explosives in shells, the reciprocating carriage and plungers carried thereby, combined with a lock adapted when stationary to lock all the plungers out of action and when moved to unlock all the plungers, a sliding block normally stationary, connections from the block to the lock, and manually-controlled means to engage the block with the carriage, thereby moving the block and lock, substantially as described.

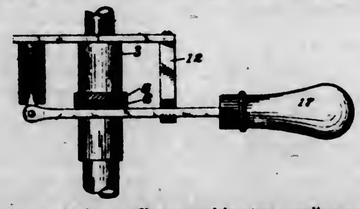
36. In a machine for packing explosives in shells, the combination with the tamps and the plungers connected thereto, of a carriage and reciprocating means therefor, independent yielding pressure devices actuating each plunger and reciprocated by the carriage, a lock holding each plunger from moving forwardly with relation to the carriage after each loading action, means to lock all the plungers from operating when moved backwardly to a determinate distance and means to restore all the plungers to their initial operative position, substantially as described.

37. In a machine for packing explosives in shells, the combination with the tamps and the plungers connected thereto, of a carriage and reciprocating means therefor, independent yielding pressure devices actuating each plunger and reciprocated by the carriage, a lock holding each plunger from moving forwardly, a dogging-bar adapted to engage and hold each plunger out of operation when said plunger is moved backwardly to a determinate distance, a sliding block normally stationary and out of engagement with the carriage and connected with the lock so as to disengage the same from the plungers when the block is operated, and manually-controlled means to engage the block with the carriage, thereby operating the block, substantially as described.

813,436. **SAFETY-CATCH.** OTTO LAMACCHIA, Bridgeport, Conn. Filed Mar. 15, 1905. Serial No. 250,304.

Claim.—In a device of the class described, the combination of a body, a casing, a catch-pin, a sliding latch-plate mounted on said casing for engaging over an end of the said catch-pin, a side of the latch-plate being cut away, and a spring having an end thereof frictionally engaging a side of the plate and adapted to enter the cut-away portion thereof at a predetermined point in its movement to prevent accidental sliding movement and disengagement of the plate from the pin.

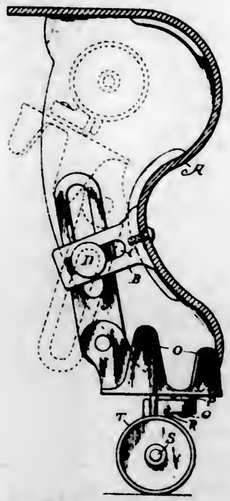
813,437. **PIPE-COUPLING.** DEWEY LANDAU, San Francisco, Cal., assignor of one-fourth to John Kunst and one-fourth to Edward McManus, San Francisco, Cal. Filed June 27, 1905. Serial No. 267,201.



Claim.—1. A pipe-coupling comprising two coupling-sections adapted to be secured to the respective pipe ends, a yoke secured to one of said sections, a bar extending forward from one end of said yoke and having at its front end a hook or tooth, a device movably connected to the other end of said yoke, a spring for depressing said device toward said yoke, and a lever pivoted on said device and having a portion adapted to engage the other section, and having also a groove or notch adapted to be engaged by said tooth or hook, substantially as described.

2. A pipe-coupling comprising two coupling-sections adapted to be secured to the respective pipe ends, a yoke secured to one of said sections, a bar extending forward from one end of said yoke and having at its front end a hook or tooth, a device movably connected to the other end of said yoke, a spring for pressing said device toward said yoke, a lever pivoted on said device and having a portion adapted to engage the other section, and having also a groove or notch adapted to be engaged by said tooth or hook, a washer in the first coupling-section, a flanged tube in the second coupling-section, its edge resting against said gasket, and a spring for pressing said flange so that the edge of the tube rests against said gasket, substantially as described.

813,438. **STOVE-LEG CASTER.** HARRY LAUER, Richmond, Ind. Filed May 26, 1905. Serial No. 262,260.



Claim.—1. In combination with a stove-leg provided with an inwardly-extending slotted bracket, the slotted link adapted to cooperate with and be secured to said slotted bracket, the leg-supporting platform pivoted to said link, said platform having ears adapted to embrace the foot of the stove-leg, the caster-frame carrying rollers and pivoted to said platform, and a roller journaled in said caster-frame and bearing against the platform.

2. In combination with a stove-leg provided with an inwardly-extending slotted bracket, the slotted link having the leg-supporting platform pivoted thereto, the screw passing through and securing said slotted link and bracket, said platform having ears adapted to embrace the foot of the stove-leg, the caster-frame carrying rollers and pivoted to said platform, and a roller journaled in said caster-frame and bearing against the platform.

3. In combination with a stove-leg provided with an inwardly-extending slotted bracket carrying a plate provided with a rib, the slotted link having teeth adapted to be engaged by said rib, the leg-supporting platform pivoted to said link, the caster-frame carrying rollers and pivoted to said platform, and a roller journaled in said caster-frame and bearing against the platform.

813,439. **MOLD.** CHARLES A. LAMSON, Findlay, Ohio, assignor to The Lamson Cement Product Company, Tiffin, Ohio. Filed Mar. 8, 1905. Serial No. 249,593.

Claim.—1. In a mold of the character described, the combination with outside walls, of separate core-walls having their adjacent ends spaced apart and beveled, the beveled faces being located in substantially the same plane, a corner-piece bridging the space between the ends of the walls and having its rear face bearing against the ends of the beveled faces, and a clamping device engaging the

corner-piece and the sides of the core-walls opposite to the beveled faces.

2. In a mold of the character described, the combination with spaced side walls, of end walls angularly disposed with respect thereto, each of said end walls being rigidly secured at one end to one of the side walls, the other end of the end walls being spaced from the adjacent end of the side wall and said adjacent ends being correspondingly beveled, corner-pieces bridging the spaces between said spaced ends and having their rear side faces bearing against the beveled faces thereof, and clamping devices engaging the corner-pieces and the sides of the core-walls opposite to the beveled faces.

3. In a mold of the character described, the combination with a bottom wall, of side walls detachably mounted thereon, upright spaced core-walls located inside the side walls and spaced therefrom, and separate bolts connecting and passing through the adjacent corresponding core and side walls to support the former with their lower edges above the bottom wall, said bolts having heads engaging the outer sides of said walls to prevent the spreading of said corresponding adjacent walls.

4. In a mold of the character described, the combination with a bottom wall, of side walls detachably mounted thereon and having reinforcing-strips, core-walls located inside the side walls and spaced therefrom, said core-walls having reinforcing-strips, bolts passing through the adjacent side and core walls and through the reinforcing-strips thereof, said bolts having heads and nuts that bear against the inner and outer sides respectively of the strips of the core and side walls, and sleeves interposed between the walls and located on the bolts.

5. In a mold of the character described, the combination with a base or bottom wall, of strips mounted thereon, means detachably connecting the base and strips to hold the latter in position on said base and permit the removal thereof, side walls mounted on the strips, and core-walls located inside the side walls and spaced therefrom, said core-walls having their lower edges spaced from the strips and from the bottom.

6. In a mold of the character described, the combination with a base or bottom wall, of strips detachably mounted upon the margins thereof, outer walls mounted on the strips and having their inner faces in substantially the same plane with the inner edges of the strips on which they rest, and core-walls located inside the outer walls and spaced therefrom, said core-walls having their lower edges in substantial alinement with the upper faces of the strips and being spaced from said strips and from the bottom.

7. In a mold of the character described, the combination with a base or bottom wall, of side and end strips located on the margins of the base or bottom walls, holding-strips arranged on certain of said strips and overlapping the others, fastening devices passing through the holding-strips, the side and end strips and engaging the base or bottom wall, outer walls located on the side and end strips, and core-walls arranged inside the outer walls in spaced relation thereto, said core-walls being also disposed in spaced relation to the strips and to the base or bottom wall.

8. In a mold of the character described, the combination with a base or bottom wall, of abutted side and end strips located on the margins of the base or bottom wall, holding-strips arranged upon the end strips and extending over the side strips, fastening devices passing through said strips and engaging the base or bottom wall, side walls located upon the side strips and having their inner faces in substantially the same plane as the inner edges of said side strips, detachable end walls fitted between the side walls and resting upon the end strips inside the holding-strips, devices for securing the end walls to the side walls, core-walls arranged inside the end and side walls, detachable connections between certain of the core-walls to permit the collapsing of the core, the lower edges of said core-walls being substantially in the same plane as the upper faces of the strips and being spaced above the bottom wall, and devices detachably connecting the side and core walls and bridging the spaces between the same.

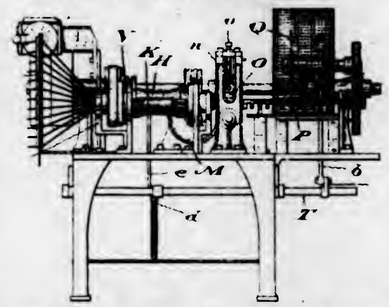
9. In a mold of the character described, the combination with a base, of outer walls mounted thereon, a plurality of core-walls spaced from the outer walls and having their lower edges spaced from the base, and foot-strips rigidly secured to the lower inner margins of the core-walls and extending the full length along the inner sides thereof, said foot-strips being also spaced from the base and from each other leaving an open bottom to the core and furthermore having their lower edges flush with the lower edges of the core-walls carrying them.

813,440. **BAG.** THOMAS MANAHAN, New York, N. Y. Filed June 23, 1905. Serial No. 266,500.

Claim.—1. A bag-mouth fastener consisting of bars made separate from the bag and springs for the bars, said springs having their ends passed through and around the bars.

2. A bag-mouth fastener comprising a plurality of bars independent of the body of the bag, and springs extending through the bars and adapted to hold the bars together.

813,441. **MACHINE FOR CUTTING COTTON-WICKING INTO LENGTHS AND BUNDLING THE SAME.** HARRY MARSH, Hamilton, Canada. Filed Mar. 6, 1905. Serial No. 248,455.



Claim.—1. In a machine of the class described, the combination of a stationary guide; a rotatable casing in line therewith; a bobbin journaled thereon, an opening being provided in the casing for the passage of thread from the bobbin; rotatable feed-rollers in line with the casing and guide; means for intermittently operating the rollers; and means for rotating the casing while the rollers are stationary, substantially as described.

2. In a machine of the class described, the combination of a stationary guide; a rotatable casing in line therewith; a bobbin journaled thereon, an opening being provided in the casing for the pas-

sage of thread from the bobbin; rotatable feed-rollers in line with the casing and guide; a suitably-operated knife; means for intermittently operating the feed-rollers; and means for bringing the knife into contact with the wicking at such times as the feed-rollers are stationary, substantially as described.

3. In a machine of the class described, the combination of a stationary guide; a rotatable casing in line therewith; a bobbin journaled thereon, an opening being provided in the casing for the passage of thread from the bobbin; rotatable feed-rollers in line with the casing and guide; a suitably-operated knife; means for intermittently operating the feed-rollers; means for bringing the knife into contact with the wicking at such times as the feed-rollers are stationary; and means for intermittently rotating the casing, substantially as described.

4. In a machine of the class described, the combination of intermittent wick-feeding means; wick-wrapping means; wick-cutting means; and means for operating the wrapping and cutting means at such times as the feeding means are stationary, substantially as described.

5. In a machine of the class described, the combination of wick-feeding means; means for intermittently operating the same; a trough for the wicking; a driving-shaft; a knife-frame journaled on the shaft; a rotary knife journaled therein; means for driving the knife from the shaft; and means for swinging the frame to bring the knife into contact with the wicking at such times as the feeding means are stationary, substantially as described.

6. In a machine of the class described, the combination of a stationary guide provided with separate openings for each one of a plurality of wicks; a stationary guide provided with a single opening for all the wicks; a rotary casing in line with the said guide; a bobbin journaled on the casing; an opening being provided in the casing for the passage of thread from the bobbin; and means for intermittently feeding the wicks through the casing, substantially as described.

7. In a machine of the class described, the combination of a stationary guide; a rotatable casing in line therewith; a driving-pulley thereon; a shaft; a pulley loose on the shaft and connected by belt with the pulley on the rotatable casing; a clutch by means of which the pulley may be given a driving connection with the shaft; rotatable feed-rollers suitably journaled in line with the guide and geared together; a shaft transverse to the main shaft and geared thereto; mutilated gearing between the transverse shaft and one of the feed-rollers whereby an intermittent motion is given the latter; and means for putting the clutch into connection with the pulley on the main shaft at such times as the feed-rollers are stationary, substantially as described.

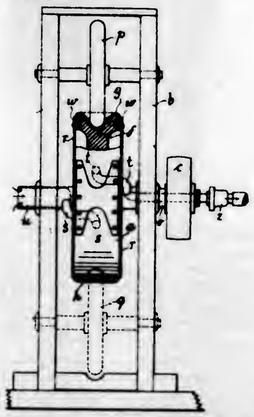
813,442. **GAS-RELIEF VALVE FOR BLAST-FURNACES.** EUGENE L. MESSLER, Pittsburg, Pa. Filed Nov. 9, 1904. Serial No. 231,966.

Claim.—1. In combination, a bleeder-conduit leading from the upper portion of a blast-furnace, a valve-seat arranged in said conduit, and a valve adapted to move upwardly toward its seat in the direction of the pressure of the gases in the bleeder-conduit, substantially as described.

2. In combination, a bleeder-conduit leading from the upper portion of a blast-furnace, a valve-seat at the top of said conduit, a bell-valve adapted to seat upwardly against said valve-seat in the direction of the pressure of the gases in the bleeder-conduit, and an operating-lever connected to the valve, substantially as described.

3. In combination, a bleeder-conduit leading from the upper portion of a blast-furnace, a valve-seat at the top of said conduit, a bell-valve adapted to seat upwardly against said valve-seat in the direction of the pressure of the gases in the bleeder-conduit, a standard at one side of the valve, a lever pivoted to the valve and to said standard and extending beyond the valve at one end and beyond the standard at the other end, and operating-chains for opening and closing the valve connected to the ends of said lever, substantially as described.

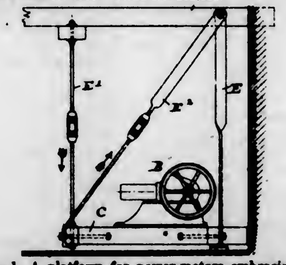
813,443. **COMPRESSOR.** HANS MIKOREY, Schöneberg, near Berlin, Germany, assignor to The Firm of W. Graaff & Company Gesellschaft mit Beschränkter Haftung, Berlin, Germany. Filed May 10, 1905. Serial No. 259,797.



Claim.—1. A compressor comprising a wheel having a groove in its periphery, a flexible membrane covering said groove so as to form an annular chamber, means for closing said chamber at one point and a roller of less thickness than the wheel engaging the membrane so as to force said membrane against the bottom of the groove.

2. A compressor comprising a wheel having a groove on its periphery, a membrane formed of rubber stretched across said groove so as to form an annular chamber, means for holding said membrane at one point permanently pressed against the bottom of the chamber, an inlet-pipe entering said chamber on one side of said means, an outlet-pipe on the other side thereof and a roller of less thickness than the wheel engaging the membrane so as to force it against the bottom of the groove.

813,444. **PLATFORM FOR POWER-MOTORS.** ARNOLD HACKE, Philadelphia, Pa., assignor of one-half to Isidor Kitsee, Philadelphia, Pa. Filed Mar. 25, 1905. Serial No. 251,056.



Claim.—1. A platform for power-motors embracing the base proper, uprights securing said base to the joist of the ceiling of the room in which the platform is placed, a swivel-brace forcing the platform upward and a swivel-brace forcing the platform downward, a floor and means to support part of said platform on said floor.

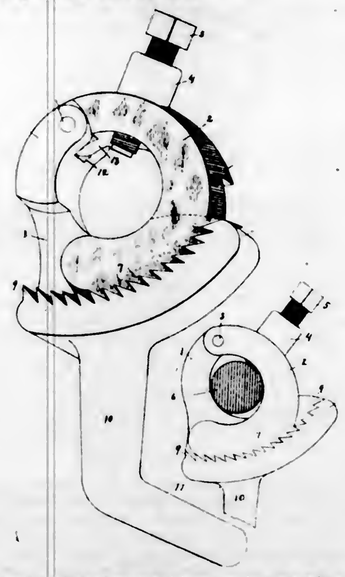
2. In combination with a platform on which a power-motor is placed, means to keep said platform suspended between the floor and ceiling of the space in which said platform is placed, swiveled means to force said platform upward and swiveled means to force said platform downward and means to support part of said platform on the floor of said space.

3. Means to lessen the vibration of a power-motor on the building in which it is placed, said means embracing a platform suspended from the ceiling, means to force said platform upward, means to force said platform downward, and means to support part of said platform on the floor.

4. In combination with a power-motor, a platform for said motor, uprights securing said platform to a ceiling, and in further combination with means to secure part of said platform to the floor.

5. In combination with a power-motor, a platform whereon said motor is placed, uprights securing said platform to a ceiling, and in further combination with adjustable means, one to force the platform upward and the other to force the platform downward.

813,445. **LATHE-DOG.** THOMAS C. PATTERSON, New York, N. Y. Filed Aug. 14, 1903. Serial No. 169,534.



Claim.—1. A lathe-dog comprising a carrier-arm and a work-clamp, said clamp consisting of a pair of bows upon one of which said arm is formed, and each bow forming about half of an annulus, a pivot connecting said bows, a set-screw tapped into one of said bows in position to cause the work to bear against both of said bows, and coöperative ratchet-teeth upon said bows.

2. A lathe-dog comprising a carrier-arm and a work-clamp, said clamp consisting of a pair of bows upon one of which said arm is formed, and each bow forming about half of an annulus, a pivot connecting said bows, a set of internal ratchet-teeth formed upon said carrier-arm bow, a set of coöperating spur or external ratchet-teeth formed upon the other bow, and a set-screw upon one of said bows in position to clamp the work against both of said bows.

3. A lathe-dog comprising a carrier-arm and a work-clamp, said clamp consisting of a pair of bows upon one of which said arm is formed, and each bow forming about half of an annulus, a pivot connecting said bows, a set of internal ratchet-teeth formed upon said carrier-arm bow, a set of coöperating spur or external ratchet-teeth formed upon the other bow, and a set-screw tapped into the last-mentioned bow near said pivot.

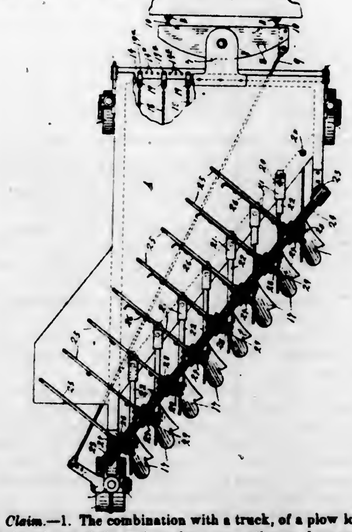
4. A lathe-dog comprising a carrier-arm and a work-clamp, said clamp consisting of a pair of bows upon one of which said arm is formed, a pivot connecting said bows, a set-screw tapped into one of said bows in position to cause the work to bear against both of said bows, an internal set of teeth formed upon the free end of said carrier-arm bow, and a coöperative set of spur-teeth formed upon the free end of the other bow; said pivot having the construction of a universal joint, to permit movement of the bows in facewise direction, to enable disengagement of one from the other and relative readjustment and reëngagement.

5. A lathe-dog comprising a carrier-arm and a work-clamp, said clamp consisting of a pair of bows upon one of which said arm is formed, a pivot connecting said bows, and a set-screw tapped into one of said bows in position to cause the work to bear against both of said bows: said bow upon which said arm is formed having a depression for receiving the free end of the other bow, the latter being provided with spur-teeth, and the wall of said depression being formed with internal teeth which coöperate with said spur-teeth.

6. A lathe-dog comprising a carrier-arm and a work-clamp, said clamp consisting of a pair of bows upon one of which said arm is formed, a pivot connecting said bows, and a set-screw tapped into one of said bows in position to cause the work to bear against both of said bows; one of said bows having a depression for receiving the free end of the other bow, and the wall of said depression being formed with a set of internal teeth; and said other bow having a coöperating set of spur-teeth formed upon its free end, and having between said teeth and said pivot a thickened body for affording ample bearing-surface for the work.

7. A lathe-dog comprising a carrier-arm and a work-clamp, said clamp consisting of a pair of bows upon one of which said arm is formed, each bow forming about half of an annulus, and a pivot connecting said bows; and a set-screw tapped into the bow which is unprovided with said arm, in position to cause the work to bear against both of said bows; the bow upon which said arm is formed having a depression for receiving the free end of the other bow, and the wall of said depression being formed with a set of internal ratchet-teeth; said other bow having a coöperating set of spur ratchet-teeth formed upon its free end, and having between said teeth and said pivot a thickened body for affording ample bearing-surface for the work; said pivot having a universal-joint construction, to permit facewise movement of the bows for disengaging one set of teeth from the other.

813,446. **GANG-PLOW.** EDMUND F. PIPER, Fargo, N. D. Filed Apr. 29, 1905. Serial No. 258,006.



Claim.—1. The combination with a truck, of a plow loosely attached to the truck-frame by a drag connection, and a second loose connection to said plow and to said truck-frame, arranged to permit only lateral and vertical movements of the plow, but to positively hold the same always in an upright position, substantially as described.

2. The combination with a truck and a plow loosely connected thereto, of a bar or rod pivoted to the plow-beam, with freedom for

hold in position on a telephone instrument and having a central perforated section of unit area and two series of sections of substan-

6. In a loading apparatus, a skid-frame having side members, rollers journaled between the side members and projecting above the

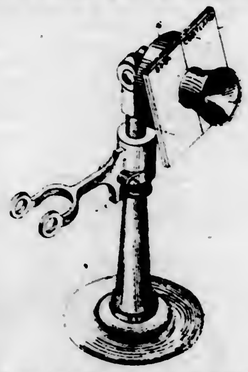
thereon; and means movable with the drum and actuated by the cable as it is wound upon the drum to stop rotation thereof.

2. The combination with a truck and a plow loosely connected thereto, of a bar or rod pivoted to the plow-beam, with freedom for pivotal movements in the vertical plane of said beam, and a pivoted support on the truck-frame, through which the upper end of each bar works telescopically, thereby holding said plow in upright position, substantially as described.

3. The combination with a truck and a plow, of a drag connection, attaching said plow to the forward portion of the truck-frame, with freedom for vertical and lateral movements, of a device for holding said plow in an upright position, while permitting said movements, said device comprising an upright pedestal swiveled to the truck-frame, a head pivoted to said pedestal for movements in a vertical plane, and a bar or rod pivoted to the plow-beam, for movements in a vertical plane, and at its upper end working telescopically through said pivoted head, substantially as described.

4. In a gang-plow, the combination with a truck having an approximately triangular truck-frame, a transversely-extended drag-bar secured to the forward portion of the truck-frame, a plurality of plows arranged in a diagonally laterally spaced row, chains independently connecting said plows to said drag-bars, a fixed shaft on said truck-frame, overlying said plows and provided with fixed notched disks, levers mounted on said fixed shaft adjacent to said notched disks and provided with latches coöperating therewith, chains connecting said plows to the overlying lever, and independent devices applied to said plows and to the truck-frames, for positively holding said plows in upright positions and permitting only lateral and vertical movements of said plows, substantially as described.

813,447. READY-REFERENCE DEVICE. HENRY W. POPE, New York, N. Y. Filed May 4, 1904. Serial No. 206,337.



Claim.—1. The combination with a telephone instrument having a suitable mouthpiece, of a memorandum device consisting of a central section held in position by said mouthpiece and folded upon opposite sides, the free edges making contact with the exterior surface of the mouthpiece.

2. The combination with a telephone instrument having a suitable mouthpiece, of a memorandum device consisting of a central section clamped in position by said mouthpiece and folded upon opposite sides toward and into engagement with said mouthpiece.

3. The combination with a telephone instrument having a suitable mouthpiece, of a memorandum device consisting of a central section held in position by said mouthpiece and having a series of folds or connected sections normally held in detachable engagement with said mouthpiece.

4. A memorandum device consisting of a sheet adapted to be held in position on a telephone instrument and having a central perforation, a series of auxiliary perforations upon opposite sides of the central perforation and a series of flaps or folds, each flap or fold having substantially one-half the area of the central section, the auxiliary perforations arranged to form complementary perforations concentric with the first-named perforation.

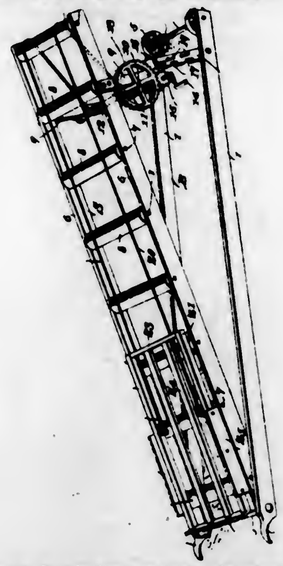
5. A memorandum device consisting of a sheet adapted to be held in position on a telephone instrument and having a central perforation and a series of auxiliary perforations upon opposite sides of the central perforation, said auxiliary perforations being arranged to form complementary perforations concentric with the first-named perforation.

6. A memorandum device consisting of a sheet adapted to be held in position on a telephone instrument and having a central perforated section of unit area and two series of sections of substantially one-half the unit area adapted to be folded in alternate reversed directions onto the central section with suitable perforations on the folding-lines of said sections.

7. A memorandum device consisting of a sheet adapted to be held in position on a telephone instrument having a central perforation and a series of auxiliary perforations upon opposite sides thereof, folding-lines bisecting said auxiliary perforations and dividing the sheets into subsections to be folded toward each other in alternate reversed directions onto the central section, the perforations being concentric and superposed.

8. A memorandum device consisting of a record-sheet adapted to be held in position on a telephone instrument and having a perforated central section, flaps or folds of less area than the central section; and auxiliary perforations, equally divided by said flaps or folds, forming complementary parts concentric with the first-named perforation.

813,448. LOADING APPARATUS. HENRY T. RAINWATER, Clinton, Ark. Filed Dec. 23, 1905. Serial No. 293,103.



Claim.—1. In a loading apparatus, a base-frame having side members provided with handles at their front ends, supporting-wheels at the rear end of the frame, and a skid-frame pivoted between the front ends of the side members of the base-frame.

2. A base-frame having carrying-wheels at its rear end and handles at its front end, a skid-frame pivoted between the front ends of the side members of the base-frame, depending brackets secured upon the side members of the skid-frame, a cross-piece connecting said brackets, and notched arms pivoted upon the side members of the base-frame.

3. A base-frame, a skid-frame pivoted between the front ends of the side members of the base-frame, rollers journaled between the side members of the skid-frame, brackets depending upon the sides of the latter, a drum-carrying shaft journaled upon said brackets, a cross-bar connecting the brackets, notched arms pivoted upon the side members of the base-frame, flexible hoisting elements connected with the drum and guided over the rollers of the skid-frame, a carriage connected with the hoisting elements, and means for operating the drum-carrying shaft.

4. A base-frame, a skid-frame pivoted between the front ends of the side members of the base-frame, means for adjustably spacing and connecting the rear ends of the two frames, rollers journaled between the side members of the skid-frame, a carriage movable over said rollers, and means for operating the carriage.

5. A base-frame, a skid-frame pivoted between the front ends of the side members of the base-frame, and means for adjustably spacing and connecting the rear ends of the two frames.

6. In a loading apparatus, a skid-frame having side members, rollers journaled between the side members and projecting above the upper edges of the latter, a carriage-frame movable over the rollers, and flanges upon said carriage-frame engaging the ends of the rollers.

813,449. BOTTLE-STOPPER. WILLIAM H. REMINGTON, Chicago, Ill. Filed Oct. 12, 1904. Serial No. 228,105.

Claim.—1. A bottle-stopper, comprising a sheet-metal cap provided with a rim adapted to be permanently fastened to the neck of the bottle and with a perforation through its top in combination with a spout having a flange confined within the cap and a nozzle projecting above such flange through and beyond the cap.

2. A bottle-stopper, comprising a sheet-metal cap provided with a crimped edge or rim for affording a permanent attachment to the neck of the bottle in combination with a spout of non-corrosive material provided with a flange confined within the cap and a nozzle projecting from the flange through an aperture in the cap and beyond said cap.

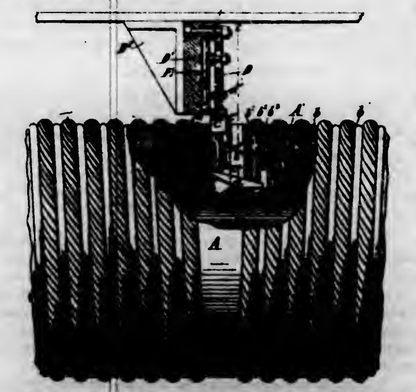
3. As a new article of manufacture, a bottle-stopper comprising a sheet-metal cap having a depending edge or rim adapted to be crimped over the neck of the bottle to provide a permanent fastening, a spout of non-corrosive material having a flange confined within the cap and a nozzle extending through an aperture in the cap and beyond and at an inclination to the same.

813,450. SOLID-RIM WOOD COLUMN. LEE A. ROBINSON and HUDLEY BIBLE, Sherman, Tex. Filed Sept. 5, 1905. Serial No. 277,615.

Claim.—1. A hollow column made from a single piece of wood, said column having an annular groove or recess formed therein, an ornamental wooden ring or collar made in two or more complementary sections and adapted to fit in said groove and a cap and base secured to the column.

2. A hollow wooden column made from a single piece of wood and having annular channels or grooves formed in its circumference, and wooden rings or collars adapted to be secured in the annular grooves, said collars being made in two or more complementary sections.

813,451. SAFETY DEVICE FOR HOISTING MECHANISMS. JOHN M. ROHLFING and PETER D. HORTON, Alliance, Ohio. Filed July 10, 1905. Serial No. 268,994.



Claim.—1. In an apparatus of the character described, the combination of a hoisting-drum, the hoisting-cable adapted to be wound thereon; and means movable with the drum and actuated by the cable as it is wound upon the drum to stop rotation thereof.

2. In a hoisting apparatus, the combination of a drum, a motor for actuating said drum, the hoisting-cable adapted to be wound upon the drum, and means carried by the drum and actuated by the cable as it is wound thereon for controlling the motor.

3. In a hoisting apparatus, the combination of a drum, a motor for actuating said drum, a hoisting-cable adapted to be wound upon the drum, a controller-trip carried by the drum and movable by the hoisting-cable as the same is wound thereon, and means actuated by the controller-trip for stopping the motor.

4. In a hoisting apparatus, the combination of a winding-drum, a motor for actuating said drum, a hoisting-cable adapted to be wound upon the drum, means carried by the drum and projecting from the surface thereof and adapted to be moved by the cable as it is wound thereon, and devices actuated by said means as the drum rotates for stopping the motor.

5. In a hoisting apparatus, the combination of a winding-drum, a motor for actuating said drum, a cable adapted to be wound thereon, a controller-trip carried by said drum and comprising a trip-pawl, and means actuated by the cable as it is wound upon the drum for moving the trip-pawl, and devices disposed in the path of the trip-pawl when thus moved for stopping the motor.

6. In an apparatus of the character described, the combination of a winding-drum, an electric motor for operating said drum, an electric circuit including the motor, a limit-switch, and means carried by the drum for throwing the switch when the limit of hoist has been reached.

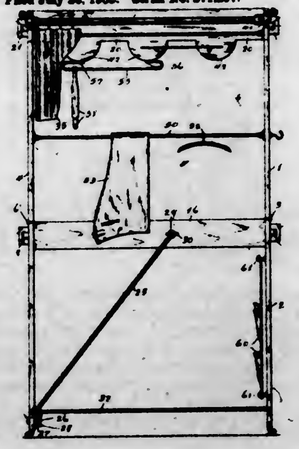
7. In a hoisting apparatus, the combination of a winding-drum, a cable adapted to be wound thereon, an electric motor for operating said drum, a limit-switch, and means carried by the drum and movable by the cable as it is wound upon the drum for placing said means in position to throw the switch.

8. In a hoisting apparatus, the combination of a winding-drum, a cable adapted to be wound thereon, an electric motor for operating said drum, an electric circuit, including said motor, a limit-switch controlling said circuit, a controller-trip carried by the drum, and comprising a trip-pawl, and devices movable by the cable as it is wound upon the drum to throw the trip-pawl into position to move the switch as the limit of hoist is reached.

9. In a hoisting apparatus, the combination of a winding-drum, a motor for actuating said drum, a cable adapted to be wound upon said drum, a trip-pawl carried by said drum, a trip-pin for moving said pawl outward, said trip-pin being actuated by the cable as it is wound upon the drum, and means adapted to be actuated by the trip-pawl to stop the motor as the limit of hoist is reached.

10. In a hoisting apparatus, the combination of a winding-drum, a motor, a cable adapted to be wound upon the drum, a trip-pawl and trip-pin carried by said drum, operative connections between the trip-pawl and trip-pin, said trip-pin being actuated by the cable as it is wound upon the drum, and means operated by the trip-pawl for stopping the motor when the limit of hoist has been reached.

813,452. PORTABLE WARDROBE. NORA RYAN, New York, N. Y. Filed July 26, 1905. Serial No. 271,297.



Claim.—The combination with a pair of oppositely-disposed frames composed of folding sections; of a cross-bar, means for detachably securing the ends of the cross-bar each to the upper end of one of the opposite folding sections; and a diagonal brace-rod detachably secured by thumb-nuts, one end to a folding section and the other end to said cross-bar between its ends.

813,453. FIRE-LIGHTING APPARATUS. CARL R. SALMEN, Montreal, Canada, assignor of one-fifth to John Fisher and one-fifth to Francis Sarlay, Catasauqua, Pa., one-fifth to John Mraney and one-fifth to Edward Firneau, Montreal, Canada. Filed Sept. 23, 1905. Serial No. 279,781.

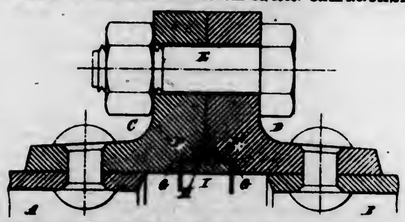
Claim.—1. A device for lighting fires consisting of a composition of matter composed of, approximately, thirty per cebt. finely-divided asbestos, fifty per cent. plaster-of-paris, ten per cent. graphite, and ten per cent. charcoal-dust.

2. A device for igniting fuel which consists of a composition of matter consisting of finely-divided asbestos, plaster-of-paris, graphite, and charcoal-dust, thoroughly mixed together, molded onto a suitable handle and baked, substantially as described.

3. A composition of matter for igniting fuel which consists of approximately one-third finely-divided asbestos, one-half plaster-of-paris, one-twelfth graphite, and one-twelfth charcoal-dust.

4. A device for igniting fuel comprising a composition of matter approximately thirty per cent. of asbestos, fifty per cent. plaster-of-paris, ten per cent. graphite, and ten per cent. charcoal-dust, kneaded into a dough, molded on a suitable handle, and afterward kiln-dried and impregnated with kerosene.

813,454. COUPLING-JOINT FOR PIPE-SECTIONS. IRNEE SCHAAD, Lucerne, Switzerland. Filed Jan. 14, 1905. Serial No. 241,018.



Claim.—1. The coupling for the adjacent ends of pipe-sections comprising the flanges secured to said ends and having in their inner adjoining edges the recesses F, G, combined with the packing H in the recesses F, and the metal ring I in the recesses G and engaging the inner surface of said packing, said ring not completely filling said recesses G, and said packing projecting from the recesses F into said recesses G; substantially as set forth.

2. The coupling for the adjacent ends of pipe-sections comprising the flanges secured to said ends and having in their inner adjoining edges the recesses F, G, combined with the packing H in the recesses F, and the metal ring I in the recesses G and engaging the inner surface of said packing, said recesses F when brought together forming an annular recess which is cone-shaped in cross-section; substantially as set forth.

3. The coupling for the adjacent ends of pipe-sections comprising the flanges secured to said ends and having in their inner adjoining edges the recesses F, G, combined with the packing H in the recesses F, and the metal ring I in the recesses G and engaging the inner surface of said packing, said ring I being formed of segments connected together; substantially as set forth.

4. The coupling for the adjacent ends of pipe-sections comprising the flanges secured to said ends and having in their inner adjoining edges the recesses F, G, combined with the packing H in the recesses F, and the metal ring I in the recesses G and engaging the inner surface of said packing, said ring I being composed of segments hinged together and the adjoining ends of the end segments being secured together by a plate and screws; substantially as set forth.

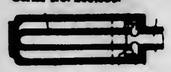
813,455. WINDOW. RICHARD O. SCHEEL, Philadelphia, Pa. Filed Nov. 21, 1904. Serial No. 233,735.

Claim.—1. The combination with a window and its casing, the latter having sash-guides, of vertically-movable carriers arranged in the sash-guides, a sash pivoted to one of the carriers for movement therewith, said sash being adapted to swing horizontally on its pivot to open position, a pair of reversely-movable locking members, and means for operating the members to simultaneously release the sash and lock the adjacent carrier against movement.

2. The combination with a window and its casing, the latter having sash-guides, of carrier-strips arranged for vertical movement in the sash-guides, a sash pivoted to one of the strips for movement therewith and to swing in a horizontal plane to open position, and a lock carried by the sash for securing the latter in closed position, said lock comprising a pair of reversely-movable locking-bars adapted for alternate engagement with the sash-frame, and means for operating the bars, one of the bars being designed for locking the sash in closed position and the other for securing the adjacent carrier-strip against movement in its guide.

3. The combination with a window and its casing, the latter having sash-guides, of carrier-strips arranged for vertical movement in the guides, a sash pivoted to one of the strips for movement therewith and to swing in a horizontal plane to open position, and a lock carried by the sash for securing the latter in closed position, said lock comprising a pair of reversely-movable rack-bars adapted for alternate engagement with the window-frame, and reversely-rotatable gears engaged respectively with the bars for operating the latter, one of the bars being designed for locking the sash in closed position and the other for securing the adjacent carrier-strip against movement in its guide.

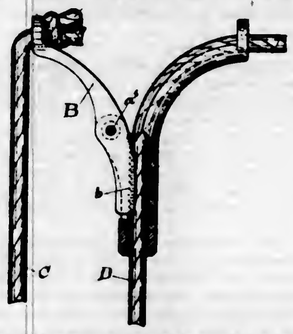
813,456. INCANDESCENT IGNITER FOR USE WITH INTERNAL-COMBUSTION ENGINES. JOHN W. SEAL, London, England, assignor of two-thirds to John Bernard Langford, Chiswick, England. Filed July 25, 1904. Serial No. 218,096.



Claim.—1. In an incandescent igniter for internal-combustion engines the combination of an ignition-tube and a casing formed of a plurality of parts inclosing said tube, said casing of such form and size as to leave a space between it and the walls of the ignition-tube, the casing having a main passage adapted to direct the main volume of the gases into the ignition-tube, and having narrow side passages adapted to direct jets of burning gas against particular points upon the outer walls of the ignition-tube.

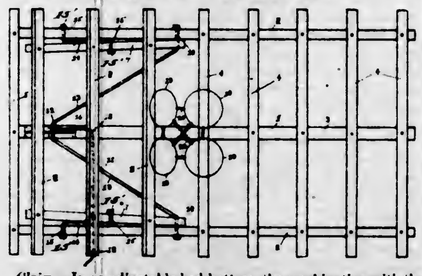
2. In an incandescent igniter for internal-combustion engines, the combination of an ignition-tube closed at one end, and a casing for said ignition-tube, said casing comprising a cap closed at one end adapted to surround the ignition-tube and to leave a space between the walls of said tube and the cap, and a plug adapted to engage the open ends of the cap and of the ignition-tube, said plug having a central bore and also side passages adapted to allow gases passing up said central bore to flow into the space between the ignition-tube and the cap and to direct said gases against particular points on the walls of the ignition-tube whereby the rapid heating of said points is insured.

813,457. GRIP FOR ROPES AND THE LIKE. GEORGE W. SEEBACH, New York, N. Y. Filed Sept. 8, 1905. Serial No. 277,630.



Claim.—A grip comprising a main member having at its lower end a straight tubular rope-guide that is recessed for a portion of its length and being thence curved and channeled to its opposite end and there provided with an eyehole, spaced pivot-lugs projecting from said main member, and a second clamping member pivoted between the lugs and having at its upper end a rope-attaching eye and at its lower end a gripping-jaw which coacts with the channeled portion of the main member in gripping the rope.

813,458. ADJUSTABLE BED-BOTTOM. JOHN SHEPHERD, Toledo, Ohio. Filed Sept. 28, 1905. Serial No. 280,414.



Claim.—In an adjustable bed-bottom, the combination with the frame 1, having the slotted side stringers 2, the middle stringer 3 provided with the rack 16, and the head-section 6, having the side bars 7 of the V-shaped bail 11, having the stirrup 12 at the apex adapted to engage the rack and move along the top and sides of the middle stringer as a guide, and the truss-arms 13 diverging from the stirrup and having their outer and portions 10 angled oppositely in alinement and extended through the inner end portions of the side bars of the head-section and through the slots of the side stringers at right angles to the side stringers, the angled end portions 10 forming both pivots and slides for the bail and the side bars, and the link-rods 14 having end portions 15 angled opposite, and pivotally connecting the side bars to the side stringers, substantially as and for the purpose set forth.

813,459. LENS-CUTTING MACHINE. WALTER W. SLADE, Boston, and HENRY F. BOWEN, Everett, Mass., assignors to Globe Optical Company, Boston, Mass., a Corporation of Massachusetts. Filed May 6, 1905. Serial No. 259,296.

Claim.—1. In a lens-cutting machine, the combination with a lens-bed and a shaft for rotating the same, of a centering mechanism mounted in said shaft.

2. In a lens-cutting machine, the combination with a lens-bed and a shaft for rotating the same, of a spring-controlled centering-pin mounted in said shaft.

3. In a lens-cutting machine, the combination with a lens-bed and a shaft for rotating the same, of a spring-controlled centering-pin mounted in said shaft and adapted to project through said bed.

4. In a lens-cutting machine, the combination with a tool-holder, a pattern and means for keeping said tool-holder in contact with said pattern, of a positioning device for said holder and spring-controlled mechanism for indicating the adjustment of said positioning device.

5. In a lens-cutting machine, the combination with a tool-holder, a pattern and means for keeping said tool-holder in contact with said pattern, of a positioning device for said holder; a graduated segment mounted upon said holder; and a spring-controlled pointer for indicating upon said segment the adjustment of said device.

6. In a lens-cutting machine, the combination of a tool-holder; a positioning device therefor; a spring-controlled crank-arm which follows the movements of said device; a shaft fast upon one end of which is said crank-arm and fast upon the other end of which is a pointer; said pointer; and a graduated member which coöperates with said pointer to indicate the adjustment of said device.

7. In a lens-cutting machine, the combination with a pattern; a support therefor; a driving mechanism and a shaft for said driving mechanism, of a presser-disk fast upon said shaft for holding said pattern against its said support; said shaft being lengthwise movable to raise said presser-disk and permit the removal of said pattern from its support.

8. In a lens-cutting machine, the combination with a supporting-frame and cutting mechanism mounted therein, of a device for holding the work, said device comprising a revoluble tripod mounted in said frame.

9. In a lens-cutting machine, the combination with a supporting-frame and cutting mechanism mounted therein, of a lens-bed upon which the work rests; a centering-pin beneath the work; and a revoluble tripod above the work.

10. In a lens-cutting machine, the combination of a frame; a driving-shaft mounted in said frame; a pattern-support; and a pattern; said shaft holding said pattern against its said support and being lengthwise slidable to permit the removal of said pattern from between the lower end of said shaft and said support.

11. In a lens-cutting machine, the combination of a frame; a driving-shaft mounted in said frame; a lens-support; means for transmitting the rotary motion of said shaft to said lens-support; a pattern; and a pattern-support against which said pattern is held by said shaft; said shaft being lengthwise movable in said frame to raise its lower end above said pattern-support and pattern and permit said pattern to be passed between the lower end of said shaft and said pattern-support.

12. In a lens-cutting machine, the combination with a supporting-frame and cutting mechanism mounted therein, of a spring-pressed work-holding revoluble tripod.

13. In a lens-cutting machine, the combination with a supporting-frame and a revoluble lens-bed mounted therein, of a revoluble tripod for holding the work upon said lens-bed; and means for pressing said tripod against the work with a uniform pressure.

14. In a lens-cutting machine, the combination with a lens-bed and mechanism for rotating the same, of a revoluble tripod driven by the rotation of said lens-bed.

15. In a lens-cutting machine, the combination with a lens-bed

of a centering-pin which projects upwardly therethrough and is adapted to contact with the under side of the work.

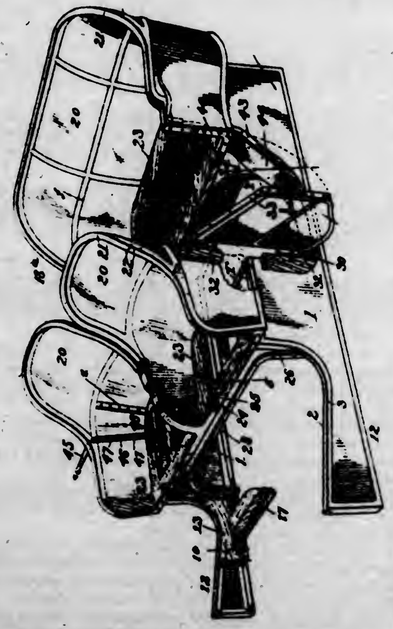
16. The combination of a pattern and means for rotating the same with a tool-holder; means for positioning said tool-holder with respect to said pattern; a graduated member and a pointer cooperating therewith to indicate the position of said tool-holder with respect to said pattern and thereby the size of the lens to be cut; said graduated member having a scale graduated to millimeters for the cutting of frameless lenses and a scale graduated in arbitrary numbers for the cutting of frame-lenses; whereby the operator is enabled to pass readily from the cutting of frameless lenses to frame-lenses of the same pattern.

17. The combination of a pattern and means for rotating the same with a tool-holder; means for positioning said tool-holder with respect to said pattern; a graduated member and a pointer cooperating therewith to indicate the position of said tool-holder with respect to said pattern and thereby the size of the lens to be cut; said graduated member having a scale graduated in millimeters for the cutting of frameless lenses, a scale graduated in arbitrary numbers for the cutting of frame-lenses and a scale with graduations for cutting full lenses, whereby the operator is enabled to pass readily from cutting one class of lens to another for the same pattern with accuracy.

18. In a lens-cutting machine, the combination with a tool-holder and mechanism for positioning the same, of complementary indicating members for indicating the position of the tool-holder and thereby the size of the lens to be cut, one of said members being movable; devices connecting said movable member with said mechanism; and means for disconnecting said movable member from said devices to permit the independent adjustment of said movable member.

19. In a lens-cutting machine, the combination with a tool-holder; a block slidably mounted therein; means controlling the position of said block; an indicating device for showing the position of said block; and means permitting the adjustment of said indicating device independent of said block.

813,460. METAL VEHICLE-BODY. HERSDALE SMITH and ARTHUR P. SMITH, Springfield, Mass. Filed May 22, 1905. Serial No. 261,767.



Claim.—1. A metal vehicle-body having body-forming plates provided at their marginal borders with integral stiffening-flanges and reinforce-beads contiguous to such flanges.

2. A metal vehicle-body having body-forming plates provided at their marginal borders with continuous integral inturned stiffening-flanges and outwardly-convexed reinforce-beads contiguous to and following said flanges.

3. A metal vehicle-body having body-forming plates provided at their marginal borders with continuous inturned stiffening-flanges, and concavo-convex beads formed therein in contiguous relation to said flanges.

4. A metal vehicle-body having a body proper and seats constructed of metal plates provided at their marginal borders with continuous inturned stiffening-flanges and outwardly-convexed reinforce-beads formed in the plates in contiguous relation to said flanges.

5. A metal vehicle-body having body-forming plates provided at their marginal borders with inturned stiffening-flanges and reinforce-beads disposed contiguous to and following the flanges, the body-plates and their flanges being united together and bearing an overlapping relation to the corner-joints.

6. A metal vehicle-body having body-forming plates provided at their marginal borders with inturned stiffening-flanges, said plates and their flanges being secured together and bearing an overlapping relation at the corners of the body, and a corner-reinforcing plate arranged at one side of and secured to the overlapping flanges at the corners.

7. A metal vehicle-body having body-forming plates provided at their marginal borders with inturned stiffening-flanges and with concavo-convex reinforce-beads following the said flanges in contiguous relation thereto, said plates and their flanges being secured together and bearing an overlapping relation at the corners, and an extra convexed upright finishing-strip secured along the outer side of each rear corner of the body with its rounded surface merging into the corresponding surface of the adjacent upright concavo-convex reinforce-beads to produce an exteriorly-rounded corner-joint.

8. A metal vehicle-body having body-forming plates provided at their marginal borders with inturned stiffening-flanges, and convex reinforce-beads arranged contiguous to and following said flanges, said body-plates and their flanges being secured together and bearing an overlapping relation at the corner-joints, and at such joints one of the body-plates and its flange being formed with a depressed seat or offset for the flanges of the other plate.

9. A metal vehicle-body having opposite metal side walls each provided at their marginal borders with inturned stiffening-flanges, an inner upright filling-board arranged at the inner side of the said wall and secured at its upper edge to the upper flange thereof, a lower horizontal supporting-strip arranged beneath the lower edge of the filling-board and secured to the lower flange of the side wall, said strip being of a greater width than the board to provide a ledge or shelf and the flooring arranged for support on the ledge or shelf of said strip.

10. In a vehicle-body, the combination with the body proper and the seat, of a transversely-arranged seat-support consisting of a transverse body member and a transversely-arranged metal bridge disposed beneath the frame and provided with an inturned flange at its upper edge.

11. In a vehicle-body, the combination with the body proper and the seat, of a seat-support consisting of a transverse body proper and a transversely-arranged metal bridge disposed along the front edge of the seat and provided at its upper edge with an inturned rest-flange and at its lower edge with a reinforcing-strip.

12. In a metal vehicle-body, the combination with the metal body proper and the seat or seats, of a seat-support comprising a transverse body member and a transversely-arranged metallic bridge disposed beneath the edge of the seat-frame and consisting of a metal plate having a horizontal portion and terminal end legs, the latter disposed at the inner sides of the metal body, said bridge being provided at its upper edge with an inturned rest-flange and at its lower edge with a separate reinforcing angle-iron strip.

13. In a metal vehicle-body, the combination of the body proper provided with a door-opening and formed of plates provided at their marginal borders with inturned stiffening-flanges, and a door consisting of a metal body or frame provided at the marginal borders thereof with an inturned stiffening-flange.

14. In a metal vehicle-body, the combination with the body proper having a door-opening and consisting of metal plates provided at their marginal borders with inturned stiffening-flanges, one of the flanged edges constituting a door-jamb, an angle-iron door-jamb reinforce-strip secured to the flanged edge constituting the jamb, and a flanged metal door carrying at its free edge a stop member.

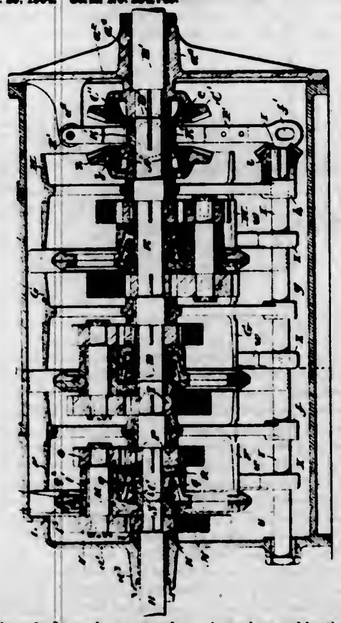
15. In a metal vehicle-body, the combination of a body proper provided with a door-opening and consisting of plates provided at their marginal borders with stiffening-flanges, one of the flanged edges constituting a door-jamb, an angle-iron reinforce-strip fitted over the flanged edge constituting the door-jamb and presenting an abutment edge flush with the outer side of the plate, and a flanged metal door provided at its free edge with a T-shaped stop-strip cooperating with said angle-iron reinforce-strip of the jamb.

16. A metal vehicle-body provided with a door-opening and consisting of plates provided at their marginal borders with stiffening-flanges, one of the flanged edges constituting a door-jamb, a reinforcing angle-iron strip fitted over the said flanged edge forming the door-jamb and having a horizontal bracing extension secured to a member within the body, and a door arranged to cover said door-opening.

17. In a vehicle-body, the body proper having a door-opening and consisting of body-forming plates provided at their marginal borders with stiffening-flanges, a molding-piece extending about the edge of the door-opening at the outer side of the body, a metal threshold-strip secured to the molding-piece at the sill of the door-opening, and a metal door arranged to cover the door-opening.

18. In a vehicle-body, the combination with the metal body portion, of an angled top-supporting bracket piercing the metal body near an edge thereof and having a leg secured to the inner side of the metal body and formed at its lower end with the foot secured to a member within the body.

813,461. CHANGE-SPEED GEARING. HOWARD R. STACKER, Philadelphia, Pa., assignor to Geo. V. Cresson Co., Philadelphia, Pa. Filed Nov. 20, 1904. Serial No. 233,746.



Claim.—1. In a change-speed gearing, the combination of a driving-shaft, a driven shaft, a train of gears and a reversing means, a cam-shaft, means whereby a cam on said shaft may be caused to connect said first-mentioned shafts through said train of gears or not as desired, said reversing means comprising a double reversed cone-pulley and corresponding clutch members, a lever for shifting said cone to engage either of said clutch members, said lever being provided with a slot, a hollow hand-shaft geared to said cam-shaft, and a hand-shaft concentric with said first-mentioned shaft and having an eccentric-pin to engage said slot and said lever.

2. In a change-speed gearing, the combination of a driving-shaft, a driven shaft, a series of trains of gears, and a reversing means, a cam-shaft, means whereby cams on said shaft may be caused to connect said first-mentioned shafts through either or all of said trains of gears, or not, as desired, said reversing means comprising a double reversed cone-pulley and corresponding clutch members, a lever for shifting said cone to engage either of said clutch members, said lever being provided with a slot, a hollow hand-shaft geared to said cam-shaft, and a hand-shaft concentric with said first-mentioned shaft and having an eccentric-pin to engage said slot and said lever.

3. In a change-speed gearing, the combination of a substantially cylindrical case closed by heads at the opposite ends, aligning driving and driven shafts substantially coaxial with said case, a cam-shaft parallel to said first-mentioned shafts, a series of trains of gears, means operated by the cams on said cam-shaft, whereby said driving and driven shafts may be connected or not through any one or more of said trains of gears, a reversing means interposed between said driving and driven shafts, said reversing means comprising a double reversed cone-pulley, female cone-pulleys, each of which is adapted to coact with one end of said cone-pulley, a bearing-lug formed on the adjacent head of said casing, a lever fulcrumed on said bearing-lug, shoes pivoted to said lever and engaging a neck formed on said cone-pulley, concentric hand-shafts, one of which is geared to said cam-shaft, and the other of which is provided with an eccentric-pin engaging a slot in said lever, said female cone-pulleys being provided with gear-teeth, and an idler pinion or pinions meshing with both sets of gear-teeth.

4. In a change-speed gearing, the combination of a driving-shaft, a driven shaft, gears mounted upon each of said shafts, a clutch member secured to one of said shafts, a disk concentric with said shafts and provided with a complemental clutch member and a second disk concentric with said shafts, a spindle or spindles projecting from the opposite faces of said second disk, pinions mounted upon the opposite ends of each of said spindles, which pinions mesh with said first-mentioned gears, means for holding said disks from rotation and means for causing said clutch members to be engaged.

5. In a change-speed gearing, the combination of driving and driven shafts, gears mounted upon each of said shafts, a clutch member on one of said shafts said clutch member being located between said gears, disks concentric to said shafts and located between said gears, a clutch member complemental to said first-mentioned clutch member mounted on one of said disks, pinions mounted on the other of said disks which pinions are adapted to transmit motion from one of said gears to the other thereof, means whereby said disks may be held from rotation and means for causing said clutch members to be engaged.

6. In a change-speed gearing, the combination of driving and driven shafts, gears mounted upon each of said shafts, a clutch member mounted upon one of said shafts, said clutch member being located between said gears, disks concentric to said shafts and located between said gears, a clutch member for one of said disks, said clutch member being complemental to said first clutch member, spindles journaled in the other of said disks, pinions mounted upon said spindles upon opposite faces of said disks, said pinions being adapted to transmit motion from one of said gears to the other thereof, means whereby said disks may be held from rotation, and means for causing said clutch members to be engaged.

7. In a change-speed gearing, the combination of driving and driven shafts, gears, one of which is mounted upon each of said shafts, a clutch member for each of said shafts, said clutch members being interposed between said gears, one of said clutch members being movable and having a disk formed thereon or attached thereto, a spring adapted to throw said movable clutch member into operative position, pinions carried by said disk, which pinions are adapted to transmit motion from one to the other of said gears, and means for retracting said clutch member and for holding said disks from rotation.

8. In a change-speed gearing, the combination of a driving-shaft, a driven shaft, a gear and a clutch member mounted upon each of said shafts, a disk, pinions carried by said disk, said pinions being adapted to transmit motion from one to the other of said shafts, one of said disks being provided with a projection and the other of said disks with a slot that is adapted to receive said projection, whereby relative rotary movement is prevented between said disks, means for causing said clutch members to be engaged, and means whereby said disks may be prevented from rotation.

9. In a change-speed gearing, the combination of driving and driven shafts, gears, one of which is mounted on each of said shafts, clutch members interposed between said gears, a disk secured to one of said clutch members, a second disk, pinions mounted on said second disk, said pinions being adapted to transmit motion from one to the other of said gears; one of said disks being provided with a projection and the other of said disks with a slot that is adapted to receive said projection, a spring adapted to cause engagement of

said clutch members, and means whereby said disks may be held from rotation.

10. In a change-speed gearing, the combination of driving and driven shafts, gears, one of which is mounted upon each of said shafts, a clutch member interposed between said gears, a disk secured to said clutch member for operating the latter, a second disk having beams or projections formed thereon, spindles journaled in said beams, said first-mentioned disks being provided with openings that are adapted to receive said projections, pinions mounted upon said spindles upon opposite faces of the second-mentioned disk, said pinions engaging said gears, means whereby said disks may be separated to engage said clutch members, and means whereby said disks may be drawn together and held from rotation.

11. In a change-speed gearing, the combination of driving and driven shafts, a gear mounted on each of said shafts, clutch members interposed between said gears, a disk secured to the movable clutch member for operating the latter, a second disk, pinions carried by said second disk and adapted to transmit motion from one to the other of said gears, said disks being provided with opposite conical surfaces, bands provided with V-shaped grooves that are adapted to engage said conical surfaces, and means whereby said bands may be caused to grip said surfaces.

12. In a change-speed gearing, the combination of driving and driven shafts, a gear mounted on each of said shafts, clutch members interposed between said gears, a disk secured to the movable clutch member for retracting the latter, a second disk, a spindle or spindles journaled in said second disk, pinions mounted on said spindles and adapted to transmit motion from one to the other of said gears, a spring interposed between said disks for forcing the movable member of said clutch into engagement, the edges of said disks being provided with oppositely-inclined conical surfaces, and bands having V-shaped grooves that are adapted to engage said surfaces to force said disks together and prevent their rotation.

13. In a change-speed gearing, the combination of driving and driven shafts, gearing for transmitting motion from one to the other of said shafts, said gearing comprising a disk or disks, and means for holding said disk or disks from rotation, said means comprising substantially semicircular friction-bands, one of such bands being provided with an L-shaped end, a lever pivoted to the ends of said bands, said bands being provided with opposing pins, and a spring mounted upon said pins for separating said bands

14. In a change-speed gearing, the combination of a substantially cylindrical casing, driving and driven shafts having bearings in the opposite ends of said casing, one end of said casing being removable, a series of units of change-speed gearing, each of which has connection with said shafts or with another of said units, said connections permitting disconnection simply by movement in the direction of the axes of said shafts, a cam-shaft for operating said change-speed gearing, and bearing-brackets fitting the bore of said casing and provided with lugs for engagement with said cam-shaft, whereby the necessity for fastening said bearing-bracket to said casing is avoided.

15. In a change-speed gearing, the combination of driving and driven shafts, gearing for transmitting motion from one to the other of said shafts, said gearing comprising a disk or disks, and means for holding said disk or disks from rotation, said means comprising substantially semicircular friction-bands, one of such bands being provided with an L-shaped end, a lever pivoted to the ends of said bands, said bands being provided with opposing pins, and a spring mounted upon said pins for separating said bands and a reversing-gearing.

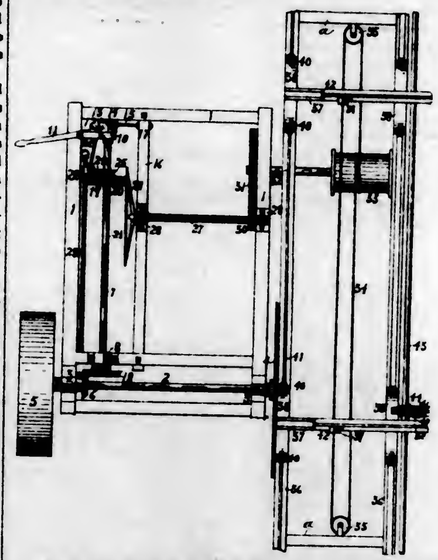
813,463. **TURN-TABLE FOR AUTOMOBILES.** HENRY R. STONEMEY, Portland, Me. Filed Dec. 26, 1905. Serial No. 293,564.

Claim.—1. The herein-described turn-table for automobiles consisting of base having an annular track thereon, a series of rollers adapted to run on said track, an annular frame resting on said rollers, radial beams secured to the top of said frame, a central vertical pin secured to said base and forming a pivot for said frame to rotate on and a ball-bearing on the upper end of said pin for resisting the upward thrust of said frame.

2. The herein-described turn-table for automobiles consisting of a base having an annular track thereon, a series of rollers adapted to run on said track, an annular frame resting on said rollers, radial beams secured to the top of said frame, a pair of ball-bearing cups on said frame, a central vertical pin secured to said base and forming a pivot for said frame and said ball-bearing cups to rotate on and a nut on the upper end of said pin.

3. The herein-described turn-table for automobiles consisting of a base having an annular track thereon, a series of rollers adapted to run on said track, an annular frame resting on said rollers, radial beams secured to the top of said frame, a hanger secured to the frame beneath each beam, a brace-rod secured to said hanger by one end and to the outer end of said beam by the other end, a central vertical pin secured to said base and forming a pivot for said frame to rotate on and a ball-bearing on the upper end of said pin for resisting the upward thrust of said frame.

813,468. **SAWMILL.** GEORGE W. STEBBINS, Shreve, Ohio. Filed Aug. 27, 1904. Serial No. 222,573.



Claim.—1. A sawmill feed mechanism, consisting of a saw-shaft, a second shaft geared thereto, a slidably-mounted friction-wheel mounted on said second shaft, a third shaft mounted at right angles to said second shaft and provided with a friction-disk adapted to be engaged by said friction-wheel, a fourth shaft suitably mounted and provided with a gear-wheel meshing with a pinion mounted on said second shaft, a winding-drum mounted on said fourth shaft, a carriage-track, pulleys secured near the ends of said carriage-track, a cable wound about said winding-drum and passing over said pulleys, carriages mounted on said carriage-track and provided with means for clamping to said cable, a winding-spool mounted beneath one of said carriages and adapted to engage the ends of said cable, a guide-rod mounted adjacent to said second shaft, a shifting block mounted on said guide-rod, an eccentric block or bearing taking over the lower end of said second shaft, a depending bracket pivotally secured at its upper end and carrying in its lower end said eccentric block or bearing, an adjustable bar secured to one side of said depending bracket whereby the same may be moved laterally, an operating-lever pivotally secured to said eccentric block or bearing, and a rod connecting the lower end of said operating-lever to said shifting block.

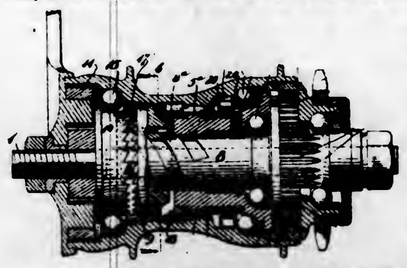
2. In a sawmill-carriage feed mechanism, the combination with a shaft suitably mounted on the saw-frame, a friction-disk mounted upon the end of said shaft, a second shaft mounted at right angles to said shaft, a double or two-part bearing formed near the upper end of said shaft, an eccentric bearing formed at the lower end thereof, an adjustably-mounted depending bracket secured to said frame and taking over said eccentric bearing a friction-wheel slidably mounted on said second shaft, and a groove or recess formed in the hub of said friction-wheel; of a guide-rod mounted adjacent to said second shaft, a shifting block mounted thereon, arms formed with said shifting

block and adapted to take into said groove or recess formed in the hub of said friction-wheel, an adjustable bar secured to one side of said depending bracket, an operating-lever pivotally secured to said eccentric bearing, and a rod connecting the lever end of said operating-lever with said shifting block.

3. In a sawmill feed mechanism, the combination with a shaft provided at its end with a friction-disk, and a shaft mounted adjacent thereto and provided with a two-part friction-wheel adapted to be shifted on said last-mentioned shaft and thrown into and out of engagement with said friction-disk; of an eccentric block or bearing formed at the lower end of said last-mentioned shaft, a depending bracket provided at its lower end with a second block or bearing taking over said eccentric block or bearing and pivotally secured at its upper end to the saw-frame, and an adjustable bolt or bar secured to the lower side of said bracket whereby the same may be moved laterally.

4. In a sawmill feed mechanism, the combination with a shaft provided at its end with a friction-disk, a shaft suitably mounted and provided with a friction-wheel adapted to be shifted thereon and engage said friction-disk, a guide-rod mounted adjacent thereto, and a shifting block mounted on said guide-rod and adapted to engage said friction-wheel; of an eccentric block or bearing formed at the lower end of said last-mentioned shaft, a depending bracket pivotally secured at its upper end to the saw-frame, and carrying said eccentric block or bearing, an adjustable bar secured to the side of said depending bracket, an operating-lever secured to said eccentric bearing, and a rod connecting the lower end of said operating-lever to said shifting block.

813,464. **TWO-SPEED HUB.** CHARLES W. SVENSON, New Britain, Conn., assignor to The Corbin Screw Corporation, New Britain, Conn., a Corporation of Connecticut. Filed Dec. 12, 1904. Serial No. 236,484.



Claim.—1. In an apparatus of the character described, a hub, a driving means therefor, two independent longitudinally-movable clutches, means to move both of said clutches in the same longitudinal direction to engage the hub, and in a reverse direction to disengage the hub, said clutch-moving means operating alternately on said clutches, and means for moving said clutches, including direct engagement between said driving means and one of said clutches, and indirect gear engagement between said driving means and the other clutch.

2. In an apparatus of the character described, a hub, a driving means, two similarly-faced independent longitudinally-movable annular clutches, means of connection whereby one of said clutches is rotatable by said driving means at a corresponding speed, means of connection whereby the other clutch is rotatable by said driving means at a relatively reduced speed, means for moving said clutches alternately toward the same end of the hub to effect driving engagement with said hub.

3. In an apparatus of the character described, a hub, a driving means, a tapered annular clutch and means of connection whereby the same is rotatable by said driving means at a corresponding speed, the tapered portion of said clutch facing toward said driving means, a second tapered annular clutch, the tapered portion thereof facing toward the first-mentioned clutch, and means of connection whereby said second clutch is rotatable by said driving means at a relatively reduced speed, and means for alternately causing said clutches to shift longitudinally and engage said hub.

4. In an apparatus of the character described, a hub, a driving means, two annular clutches and means to cause the same to alternately engage the hub when either clutch is moved toward one end of the hub, and to free either clutch from said hub when moved toward the opposite end.

5. In an apparatus of the character described, a hub, two tapered clutch-surfaces formed therein and faced in the same direction, one of said clutch-surfaces being of slightly greater diameter than the other clutch-surface, independent annular clutches adapted and arranged to move longitudinally and engage alternately with said surfaces, means to move said clutches longitudinally, a driving means, and connecting means whereby the latter is connected with one of said clutches so as to rotate the same at a certain speed relatively thereto, and with the other clutch so as to rotate the same at a relatively reduced speed.

6. In an apparatus of the character described, a hub, a rotatable driving means, two annular longitudinally-movable clutches arranged to alternately engage said hub, means of connection between said driving means and each of said clutches, whereby one of the latter will be rotated at a corresponding speed to the driving means, and the other at a relatively reduced speed, and means for automatically and alternately coupling said clutches with said hub by each successive pause of said driving means.

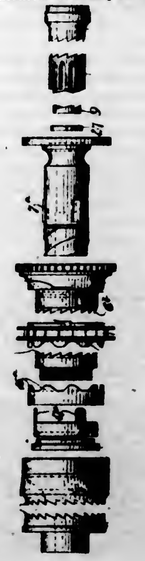
7. In an apparatus of the character described, a hub, a driving means therefor, gears, longitudinally-movable clutches for alternately coupling said driving means with said hub directly in one instance and indirectly through the medium of said gears in the other instance, said devices including means for automatically blocking out one of said clutches from engagement with said hub on each alternate pause of said driving means.

8. In an apparatus of the character described, a hub, a driving means therefor, gears, longitudinally-movable clutches for alternately coupling said driving means with said hub directly in one instance and indirectly through the medium of said gears in the other instance, said devices including means for automatically blocking out one of said clutches to prevent its engagement with the hub on each alternate pause of the driving means, said blocking-out device including an intermittently-acting controller.

9. In an apparatus of the character described, a hub, driving means therefor including longitudinally-movable clutch mechanism, a direct drive and a gear-drive, and means operated by the movement of said hub for automatically controlling said clutch mechanism to cause the direct drive and gear-drive to alternately coöperate as a connecting medium between the hub and the driving means.

10. In an apparatus of the character described, a hub, driving means therefor including two longitudinally-movable clutches, a direct drive and a gear-drive operating through said clutches alternately, one of said clutches being of larger diameter than the other clutch, with seats within said hub adapted to receive said clutches respectively.

813,465. **TWO-SPEED HUB.** CHARLES W. SVENSON, New Britain, Conn., assignor to The Corbin Screw Corporation, New Britain, Conn., a Corporation of Connecticut. Filed May 31, 1905. Serial No. 263,206.



Claim.—1. In a two-speed hub mechanism, a hub, a clutch, a driving member, and means intermediate of said clutch and said high-speed member, a low-speed member, a driver directly connected with the former and indirectly with the latter, and a coupling device

813,467.

each including inner bearing-bars, outer bearing-bars, and links connecting the inner bars to the outer bars, and links for connecting

Claim.—1. In a two-speed hub mechanism, a hub, a clutch, a driving member, and means intermediate of said clutch and said driving member for coupling said parts so that they will turn in one direction at the same speed, said means transmitting power from said driving member to said clutch, and other means between the same clutch and said driving member whereby they will turn in one direction at different speeds, said means conveying power from the driving member to said clutch and means operated by a change in the relative speed of the driver and hub for effecting the change from the high-speed drive to the low-speed drive, and vice versa.

2. In a two-speed hub mechanism, a hub, a clutch, a driving member, and means intermediate of said clutch and said driving member for coupling said parts so that they will turn in one direction at the same speed, and other means between the same clutch and said driving member whereby they will turn in one direction at different speeds and means operated by a change in the relative speed of the driver and hub for effecting the change from the high-speed drive to the low-speed drive, and vice versa.

3. In a two-speed hub mechanism, a hub, a clutch, a driving member, and means intermediate of said clutch and said driving member for coupling said parts so that they will turn in one direction at the same speed, said means transmitting power from said driving member to said clutch, and other means between the same clutch and said driving member whereby they will turn in one direction at different speeds, said means conveying power from the driving member to said clutch, and means for automatically effecting the change from relatively high speed to relatively low speed between the driver and said clutch.

4. In a two-speed hub mechanism, a hub, a clutch, a driving member, and means intermediate of said clutch and said driving member for coupling said parts so that they will turn in one direction at the same speed, and other means between the same clutch and said driving member whereby they will turn in one direction at different speeds, and means for automatically effecting the change from relatively high speed to relatively low speed between the driver and said clutch.

5. In a device of the character described, a driver, a clutch, a hub, said clutch adapted to engage said hub, a spiral support for said clutch, and means intermediate said driver and said spiral for transmitting power and rotary motion at two relatively different speeds and a controller located within the hub and operable by the hub to shift the driving connection from high speed to low speed, and vice versa.

6. In a device of the character described, a driver, a clutch, a hub, said clutch adapted to engage said hub, a spiral support for said clutch, and means intermediate said driver and said spiral for transmitting power and rotary motion at two relatively different speeds, including a low-speed member and a high-speed member, a coupling for the latter and means to automatically interlock and free said coupling alternately with said high-speed member or said low-speed member.

7. In a device of the character described, a hub, a driver or sprocket, a high-speed member, a low-speed member, a clutch cooperating with both of said members alternately, a coupling device for one of said members, and means for automatically coupling and uncoupling said high-speed member with said clutch.

8. In a device of the character described, a hub, a driver or sprocket, a high-speed member, a low-speed member, a clutch cooperating with both of said members alternately, a coupling device for one of said members, and means for automatically coupling and uncoupling said high-speed member with said clutch through the medium of said low-speed member.

9. In a device of the character described, a hub, a driving member or sprocket, a high-speed member directly connected to said sprocket, a low-speed member concentric with the former, intermediate gear connections between said low-speed member and said sprocket, a clutch, said low-speed member being operatively connected therewith at all times, and means for automatically and alternately engaging and disengaging said high-speed member with said clutch.

10. In a device of the character described, a hub, a clutch, a spiral support for said clutch, a low-speed member operatively connected to said spiral at all times, planet-gears carried thereby, a sun-gear in mesh with said planetary gears, means to permit the sun-gear to turn freely in one direction and to hold it against rotation in an opposite direction, a high-speed member, a coupling device between said high-speed member and said clutch and means for engaging and disengaging said coupling member from said high-speed member.

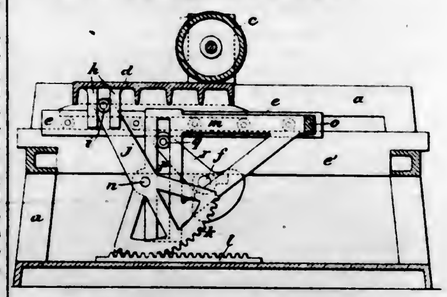
11. In a device of the character described, a hub, a clutch, a high-speed member, a low-speed member, a driver directly connected with the former and indirectly with the latter, and a coupling device for one of said members between it and the clutch, and means for alternately and automatically engaging and disengaging said coupling member.

12. In a device of the character described, a hub, a driver, means for transmitting power from said driver to said hub at two different ratios, said means including a sun and planetary gear, said sun-gear being free to revolve when power is being transmitted through the high-speed member, and means to automatically check the rotation of said sun-gear when power is being transmitted through said planetary gears.

13. In a device of the character described, a hub, a clutch, a single driver, means for transmitting power at relatively different ratios from said single driver to said hub, a coupling device, a blocking-out member, controlling means for automatically and alternately engaging with, and disengaging said coupling from, the source of power.

14. In a device of the character described, a single clutch for transmitting power at two relatively different speeds from the driving to the driven member, an automatic controlling device for said clutch comprising a controller having a step-by-step rotary action, and a controller-actuator having a limited oscillating action.

813,466. PRINTING-PRESS. CHARLES B. SWINK, Muncie, Ind. Ter. Filed Apr. 22, 1905. Serial No. 256,268.



Claim.—1. In a printing-press, the combination of a bed-plate, a swinging lever, a movable slotted plate pivoted to said lever, and a rotatable crank provided with a wrist-pin engaging in the slot provided in said plate, substantially as described.

2. In a printing-press, the combination of a bed-plate, a swinging lever provided at one end with a sector engaging with a fixed rack and at its other end with a wrist-pin engaging said bed-plate, a movable extension-plate pivoted to said lever and having a slot provided therein, and a rotating crank provided with a wrist-pin engaging in said slot to reciprocate the plate and actuate said lever and bed, substantially as described.

3. In a printing-press, the combination of a bed-plate provided with a depending slotted arm rigidly secured thereto, a swinging lever provided at one end with a sector meshing with a fixed rack and at its other end with a wrist-pin engaging and movable in the slotted arm, a movable slotted plate pivoted to said swinging lever, and a rotatable crank having a wrist-pin engaging in the slot provided in said plate, substantially as described.

813,467. HEADWEAR. FRANK TAYLOR and ADDIE TAYLOR, Bay City, Mich. Filed June 14, 1905. Serial No. 265,210.

Claim.—1. A bonnet embodying a one-piece peak and a cape, the latter having combined with it an elastic drawing-string, and a visor combined with the peak and disconnected from the cape.

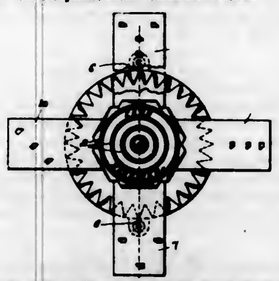
2. A bonnet embodying a peak and cape constructed of a single piece of relatively sleazy material and having combined with it an elastic drawing-string, and a relatively stiff visor secured to the peak and disconnected from the cape.

3. A bonnet embodying a peak, a cape and a visor combined with the peak and disconnected from the cape, and an elastic securing member disposed at the juncture of the peak and the cape.

4. A bonnet embodying a relatively limber peak and cape, and a relatively stiff visor combined with the peak and disconnected from the cape at the sides, and an elastic securing member disposed on a curve at the juncture of the peak and the cape.

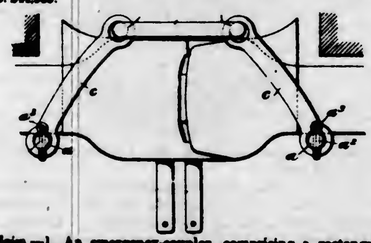
813,467.

813,468. CARD OR CHECK RECEIVER. JOHN C. TUTT, Kansas City, Mo. Filed Sept. 26, 1905. Serial No. 279,263.



Claim.—A card or check receiver of the character described, comprising a resilient piece of metal formed with a body portion and a plurality of outwardly-extending V-shaped points, the said points curved under the body portion, substantially as described.

813,469. EMERGENCY CAR-COUPLING. NORMAN WARNER and GEORGE W. JACOBS, Glenns Ferry, Idaho. Filed Feb. 9, 1905. Serial No. 244,969.



Claim.—1. An emergency-coupler, comprising a rectangular member arranged above the coupler-heads, and engaging members depending from opposite sides of the rectangular member and coacting with said heads.

2. An emergency-coupler, comprising a rectangular link designed to extend across contiguous ends of companion coupling-heads, and engaging members pivotally connected to opposite sides of said link and coacting with the heads.

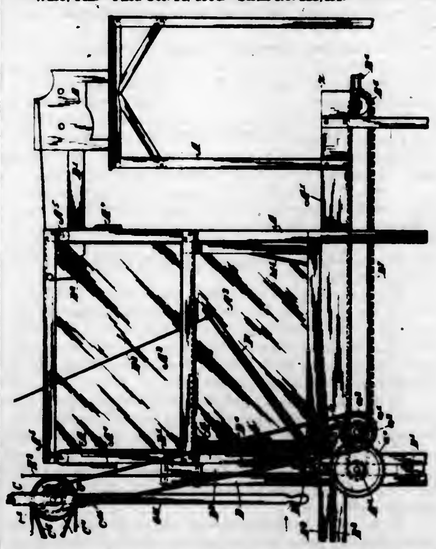
3. An emergency-coupler, comprising a rectangular link, and duplicate engaging members designed to extend at angles to said link when the coupler is in operative position and designed to fold down upon the link when the coupler is out of operation.

4. An emergency-coupler, comprising duplicate engaging parts, each including inner bearing-bars, outer bearing-bars, and links connecting the inner bars to the outer bars, and links for connecting the inner bar of one engaging part to the inner bar of the companion engaging part.

5. An emergency-coupler, comprising duplicate engaging parts, each including inner bearing-bars, outer bearing-bars, and links connecting the inner bars to the outer bars, and links for connecting the inner bar of one engaging part to the inner bar of the companion engaging part, the latter links constituting integral continuations of the inner bars.

6. An emergency-coupler, comprising duplicate engaging parts, each of said parts including an inner bearing-bar, links having openings at their inner ends for said bar and openings at their opposite ends, and an outer bearing-bar removably held in the latter openings, and links for connecting the inner bearing-bars of companion engaging parts.

813,470. MATTRESS-MAKING MACHINE. CHARLES W. WHITE, Waco, Tex. Filed Oct. 14, 1904. Serial No. 228,481.



Claim.—1. In a mattress-making machine, the combination of a main frame, a slatted apron supported by said frame, a mattress-forming frame adapted to rest upon said slatted apron, rigid projections secured to the under side of the mattress-forming frame for connecting the slatted apron and said mattress-forming frame, so that by such rigid connection the angle-irons may act to move the forming-frame either forward or backward and means for moving said slatted apron in two directions for inserting and withdrawing the mattress-frame into and from the tick, said means comprising two pulleys having clutch-faces, mechanism for rotating said pulleys in opposite directions and devices for connecting one or the other of said pulleys to the apron-supporting means.

2. In a mattress-making machine, the combination of a main frame, comprising uprights, and side pieces connecting said uprights, a slatted apron disposed between the side pieces, panels disposed between the uprights of the main frame to constitute a chamber above the slatted apron, a chute for delivering materials into said chamber, a valve controlling the discharge of material from said chute into said chamber, and means for operating said valve.

3. In a mattress-making machine, the combination of a main frame provided with ways or guides, bearing-blocks adapted to move up and down in said ways or guides, a lifting-shaft journaled in said blocks, a compression-frame hinged to said vertically-movable blocks independent of the lifting-shaft, and means connecting said lifting-shaft with the free end of the compression-frame.

4. In a mattress-making machine, the combination of the main frame comprising uprights, vertical guides or ways at one end of said frame, bearing-blocks vertically movable in said guides or ways, a rack or pinion for moving said bearing-blocks, a lifting-shaft jour-

naled in said bearing-blocks, a compression-frame carried by the bearing-blocks independent of the lifting-shaft, and a flexible connection between the lifting-shaft and free end of the compression-frame, a slatted apron supported by said frame, a mattress-forming frame adapted to rest upon such slatted apron, rigid pieces secured

sliding of said parts upon each other, substantially as and for the purposes set forth.

plurality of slots formed parallel with the roter-axis, an insulated rod disposed within each of said slots and extending beyond each

naled in said bearing-blocks, a compression-frame carried by the bearing-blocks independent of the lifting-shaft, and a flexible connection between the lifting-shaft and free end of the compression-frame.

5. In a mattress-making machine, the combination of the main frame comprising uprights, vertical guides or ways at one end of said frame, bearing-blocks vertically movable in said guides or ways, a rock or pinion for moving said bearing-blocks, a lifting-shaft journaled in said bearing-blocks, a cross-piece connecting said bearing-blocks, a compression-frame hinged directly to said cross-piece independent of the lifting-shaft, and a flexible connection between the lifting-shaft and free end of the compression-frame.

6. In a mattress-making machine the combination of a main frame, a slatted apron carried by said frame, means for moving the slatted apron, first in one and then in the opposite direction, a mattress-forming frame comprising a series of slats and a plunger or ram constituting the end of the mattress-forming frame, means for adjusting the plunger or ram longitudinally of said series of slats to vary the length of mattress formed by the forming-frame, and fixed angle-irons for connecting the said mattress-forming frame to said apron.

7. In a mattress-making machine, the combination of the main frame, a slatted apron carried by said frame, a mattress-forming frame adapted to be supported upon said slatted apron, said forming-frame comprising a series of slats, a plunger or ram constituting the end of the mattress-forming frame, an adjustment-piece to which said plunger or ram is secured, and means for adjusting said adjustment-piece longitudinally of the series of slats to position the plunger for the making of mattresses of different lengths.

8. In a mattress-making machine, the combination of a main frame, a slatted apron carried thereby, a laterally-adjustable mattress-forming frame supported by said slatted apron, a plunger adjustable longitudinally of said mattress-forming frame and an adjustable deflector, adapted to engage the plunger and direct material in front of said plunger.

9. In a mattress-making machine, the combination of a main frame and a slatted apron carried thereby, a laterally-adjustable mattress-forming frame supported by said slatted apron, a plunger adjustable longitudinally of said mattress-forming frame and an adjustable deflector, having cleats, adapted to engage the plunger and direct material in front of said plunger.

10. In a mattress-making machine, the combination of a main frame, a slatted apron carried thereby, a mattress-forming frame supported on said apron, said mattress-forming frame comprising a series of slats, means for laterally adjusting said slats toward and from each other, a plunger, an adjustment-piece to which said plunger is secured, and means for securing the adjustment-piece in adjustable position.

11. In a mattress-making machine, the combination of a main frame, a slatted apron carried thereby, a mattress-forming frame supported on said apron, said mattress-forming frame comprising a series of slats, angle-irons fixedly secured to the bottoms of said slats and adapted to engage between the slats of the apron, means for laterally adjusting said slats toward and from each other, a plunger, an adjustment-piece to which said plunger is secured, and a set-screw for securing the adjustment-piece in adjusted position.

12. In a mattress-forming machine, the combination of the main frame for receiving the material to be formed into a mattress, a plunger for forcing the material into the tick, means for feeding material onto the main forming-frame, and a deflector adapted to engage the plunger and direct material in front of said plunger.

13. In a mattress-forming machine, the combination of a main frame for receiving material to be formed into a mattress, a plunger for forcing the material into the tick, and a deflector mounted to swing about its upper edge and adapted to extend in front of the plunger to direct material into the main frame and in front of the plunger.

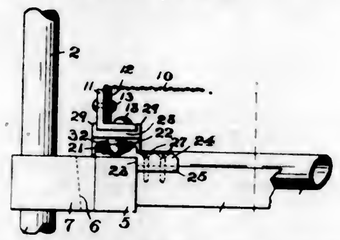
14. In a mattress-forming machine, the combination of a main frame for receiving material to be formed into a mattress, means for feeding material onto said frame, a plunger, a deflector interposed between said feeding means and plunger to deflect material in front of the latter, and means for adjusting said deflector.

15. In a mattress-forming machine, the combination of a main frame for receiving material to be formed into a mattress, means for feeding material onto said frame, a plunger, a deflector interposed between said feeding means and plunger to deflect material in front of the latter, a rising and falling cross-piece to which the deflector is hinged, and means for adjusting the width of the deflector to the size of mattress to be made.

16. In a mattress-making machine, the combination of a main frame, a slatted apron supported by said frame, a mattress-forming frame adapted to rest upon such slatted apron, rigid pieces secured to the bottom of the frame, and adapted to extend between the slats of the slatted apron and means for moving said slatted apron forward or backward and for inserting and withdrawing a mattress-frame into and from the tick.

17. In a mattress-making machine, the combination of a main frame, a slatted apron carried by said main frame, a mattress-forming frame adapted to be carried by said slatted apron, said mattress-forming frame comprising a series of slats and a plunger or ram secured to the side pieces of the forming-frame, and means for adjusting said plunger or ram longitudinally of the slats to vary the length of the mattress formed by said frame.

813,471. **METAL BED.** CHARLES J. WIDGREN, Newark, N. J. Filed Aug. 20, 1905. Serial No. 274,192.



Claim.—1. In a metal bed, the combination, with the metal framework of the bedstead and a metal bar of the bed-spring, of a bearing or holding means comprising two elements connected respectively with the metal framework of the bedstead and the metal bar of the bed-springs, one of said elements being provided with a cup-shaped receiving depression, and said elements being in supporting engagement, and means connected with the other one of said elements extending into and being in oscillatory supporting engagement with said receiving depression to prevent slipping or sliding of one element upon the other, substantially as and for the purposes set forth.

2. In a metal bed, the combination, with the metal framework of the bedstead and a metal bar of the bed-spring, of a bearing or holding means comprising two elements connected respectively with the metal framework of the bedstead and the metal bar of the bed-springs, said elements being in supporting engagement, and one of said elements being provided with a cup-shaped pin or stud receiving socket, and a pointed pin or stud upon the other element, extending into and being in oscillatory supporting engagement with said socket to prevent slipping or sliding of one element upon the other, substantially as and for the purposes set forth.

3. In a metal bed, the combination, with the metal framework of the bedstead, of a metal side bar formed with an end member, an upwardly-extending bearing on said end member, a laterally-extending metal cross-bar of a bed-spring, said bearing being provided with a cup-shaped receiving depression, a bearing member on said cross-bar, and means connected with the bearing member of said cross-bar extending into and being in oscillatory supporting engagement with said receiving depression to prevent slipping or sliding of said bearing members upon each other, substantially as and for the purposes set forth.

4. In a metal bed, the combination, with the metal framework of the bedstead, of a metal side bar formed with an end member, an upwardly-extending bearing on said end member, a laterally-extending metal cross-bar of a bed-spring, a bearing member on said cross-bar, the bearing member of the metal side bar being provided with a cup-shaped pin or stud receiving socket, and a pointed pin or stud upon the bearing member of said side bar, extending into and being in oscillatory supporting engagement with said socket to prevent slipping or sliding of said bearing members upon each other, substantially as and for the purposes set forth.

5. In a metal bed, the combination, with the metal framework of the bedstead, of a metal side bar formed with an end member, an upwardly-extending bearing on said end member, a metal side rod and a laterally-extending metal cross-bar of a bed-spring, a supporting-block between said side rod and laterally-extending bar, an arm extending laterally from said block, and means on said bearing of the end member and said arm of said block to prevent slipping or

sliding of said parts upon each other, substantially as and for the purposes set forth.

6. In a metal bed, the combination, with the metal framework of the bedstead, of a metal side bar formed with an end member, an upwardly-extending bearing on said end member, a metal side rod and a laterally-extending metal cross-bar of a bed-spring, a supporting-block between said side rod and laterally-extending bar, an arm extending laterally from said block, the bearing of said end member being provided with a pin or stud receiving socket, and a pin or stud upon the arm of said block to prevent slipping or sliding of said parts upon each other, substantially as and for the purposes set forth.

7. In a metal bed, the combination, with the metal framework of the bedstead, of a metal side bar formed with an end member, an upwardly-extending bearing on said end member, a metal side rod and a laterally-extending metal cross-bar of a bed-spring, a supporting-block between said side rod and laterally-extending bar, an arm extending laterally from said block, ribs on said arm said ribs embracing portions of the laterally-extending bar of the bed-spring, and means on said bearing of the end member and said arm of said block to prevent slipping or sliding of said parts upon each other, substantially as and for the purposes set forth.

8. In a metal bed, the combination, with the metal framework of the bedstead, of a metal side bar formed with an end member, a metal side rod and a laterally-extending metal cross-bar of a bed-spring, a supporting-block between said side rod and laterally-extending bar, an arm extending laterally from said block, ribs on said arm said ribs embracing portions of the laterally-extending bar of the bed-spring, the bearing of said end member being provided with a pin or stud receiving socket, and a pin or stud upon the arm of said block to prevent slipping or sliding of said parts upon each other, substantially as and for the purposes set forth.

813,472. **ELECTRIC MACHINE.** EDWARD J. WILLIS, Richmond, Va. Filed Feb. 8, 1905. Serial No. 244,772.

Claim.—1. An element for induction electric machines, provided with a plurality of rods extending longitudinally beyond the ends of the element and a plurality of bonds consisting of naked wires spaced apart and extending entirely around said element upon said extended ends and each bond electrically connected with each rod at each contact-point.

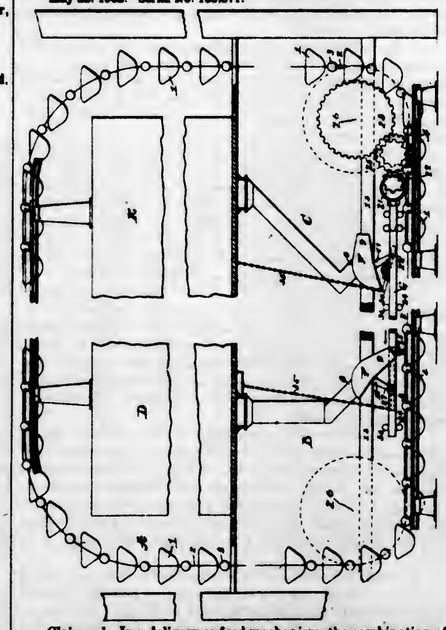
2. An element for induction electric machines provided with a plurality of rods extending longitudinally beyond the ends of the body of the element and a bond extending continuously and spirally a plurality of times entirely around said extended ends and each coil of the spiral electrically connected with each of said extended ends adjacent to but separated from the preceding coil.

3. An element for induction electric machines provided with a plurality of slots formed parallel with the rotor-axis, an insulated rod disposed within each of said slots and extending beyond each end of the body and a bond extending continuously and spirally a plurality of times entirely around the element and each coil of the spiral electrically connected with each of the extended ends adjacent to but not touching the preceding coil.

4. An element for induction electric machines comprising a laminated body provided with a plurality of slots formed parallel with the rotor-axis, a rod disposed within each of the said slots and insulated from and extending beyond each end of the said laminated body each of said extended ends being provided with a plurality of transverse notches disposed in circumferential alinement entirely around the cage formed by said extended ends and a plurality of bonds equal in number to the number of notches in each end of each rod and extending entirely around said element and each disposed within and electrically connected at each notch of each alined series.

5. An element for induction electric machines comprising a laminated body provided with a plurality of slots formed parallel with the rotor-axis, a rod disposed within each of said slots insulated from and extending beyond each end of the said laminated body each of said extended ends being provided with a plurality of transverse notches disposed in circumferential alinement entirely around the cage formed by said extended ends, bonds at each end wound spirally about said cage and disposed within said notches and means securing said bonds within said notches and in electrical connection with said rods.

813,473. **CONVEYER-CHUTE.** FREEMAN R. WILLSON, Jr., Worthington, Ohio, assignor to Joseph A. Jeffrey, Columbus, Ohio. Filed May 23, 1903. Serial No. 158,571.



Claim.—1. In a delivery or feed mechanism, the combination of a conduit for material having a delivery-opening, a chute adapted to receive material from said opening, a longitudinally-reciprocating bar to which the chute is connected whereby said chute may be moved to deliver such received material, and a closing means for said opening operated to cut off material from the chute when the latter is moved to deliver its material.

2. In a delivery or feed mechanism, the combination of a conduit for material having a delivery-opening, a chute adapted to receive material from said opening, a longitudinally-reciprocating bar to which the chute is connected whereby said chute may be moved to deliver such received material, and a closing means for said opening carried by the chute and acting to cut off material from the chute when the latter is moved to its delivery position.

3. The combination of a series of material-conduits having delivery-openings, discharge-chutes adapted to receive material from said conduits, and to travel in a circular path to deliver said mate-

16. An oscillating chute arranged to intermittently receive and deliver material, said chute having at its delivery end a gravity-co-

of a tilting device for the buckets, and means for moving said device into and out of operation, said means adapted to arrest the move-

tively moving said member into either an operative or an inoperative position, and means for retaining said lever and feeder member in

3. The combination of a series of material-conduits having delivery-openings, discharge-chutes adapted to receive material from said openings, and to travel in a circular path to deliver said material a reciprocating bar, and means for connecting any of said chutes to the bar, substantially as set forth.

4. The combination of a tilting chute adapted to receive and deliver material, a reciprocating bar, an adjustable pitman connected with the bar, and means whereby said pitman may be connected with the chute to operate the latter.

5. The combination of a conduit for material having a delivery-opening, a tilting chute near said opening, means operated with the chute for closing said opening when the chute is moved into delivery position, a longitudinally-reciprocating bar for operating the chute and means for connecting said bar and chute.

6. The combination of a series of tilting chutes, a reciprocating bar, a series of adjustable pitmen connected with the bar and means whereby the latter may be connected with and disconnected from the chutes, substantially as set forth.

7. The combination of a conveyor, a conduit for material having a delivery-opening, a chute adapted to receive material from said opening, a longitudinally-reciprocating bar to which the chute is connected whereby said chute may be operated to deliver such received material to the conveyor, and a closing means for said opening operated with the chute to cut off material from the chute when the latter is moved into delivery position.

8. The tilting chute having at its delivery end a gravity-actuated gate adapted to retain material when the chute is in its receiving position and to swing freely relative to the said delivery end to permit free discharge of the material when the chute is in its delivery position, and having at its receiving end a cut-off plate arranged to check the flow of material to the chute when it is in its delivery position, substantially as set forth.

9. The combination of an endless bucket conveyor, driving mechanism therefor, a material-conduit having a delivery-opening, a discharge-chute adapted to receive material from said opening and to travel in a circular path to discharge it into said buckets, and means for operating said discharge-chute connected with the driving mechanism of the conveyor, substantially as set forth.

10. The combination of an endless bucket conveyor, driving mechanism therefor, the material-conduit having a delivery-opening, the discharge-chute adapted to receive material from said opening and discharge it into said buckets, closing means for said opening operating to cut off the flow of material from the said conduit to the discharge-chute while the latter is delivering its charge into a bucket, and means for operating said discharge-chute connected with the driving mechanism of the conveyor, substantially as set forth.

11. The combination of an endless bucket conveyor, driving mechanism therefor, a material-conduit having a delivery-opening, a discharge-chute receiving material from said opening, closing means for said opening adapted to intermittently cut off the flow of material from said conduit to said discharge-chute while the latter is delivering its charge into a bucket, and operating means connecting said closing means with the driving mechanism of the conveyor, substantially as set forth.

12. The combination of an endless bucket conveyor, driving mechanism therefor, the material-conduit having a delivery-opening, a discharge-chute receiving material from said opening, closing means for said opening carried by the chute and acting to intermittently cut off material from the chute when the latter is delivering its charge into a bucket, and means connecting said discharge-chute with the driving mechanism of the conveyor, substantially as set forth.

13. The combination of an endless bucket conveyor, driving mechanism therefor, material-conduits having delivery-openings, discharge-chutes adapted to receive material from said openings and to travel in a circular path to discharge said material, a reciprocating bar connected with the said driving mechanism, and means for detachably connecting any of said chutes with said bar, substantially as set forth.

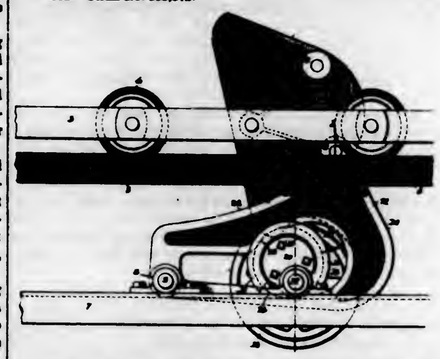
14. The combination of a conveyor, a material-conduit having a delivery-opening, a tilting chute adapted to receive material from said opening and having a depending arm, a reciprocating bar, and means for detachably connecting said bar to said arm to operate the chute, substantially as set forth.

15. The combination with a material-conduit, of a chute adapted to receive material from said conduit and arranged to oscillate relative to said conduit in order to discharge material received therefrom, and having at its end adjacent to said material-conduit a cut-off wall arranged to cut off the flow of material from said conduit when said chute is in its discharge position.

16. An oscillating chute arranged to intermittently receive and deliver material, said chute having at its delivery end a gravity-actuated gate pivotally connected to it and adapted to retain material when the chute is in its receiving position and to swing freely relative to said delivery end to permit the free discharge of the material when the chute is in its delivery position.

17. The combination with a material-conduit, of an oscillating chute adapted to receive material from said conduit and having at its end adjacent to said conduit a cut-off wall arranged to cut off the flow of material to said chute when the chute is in its discharge position and having at its discharge end a gravity-actuated pivotally-mounted gate.

813,474. **CONVEYER.** FREEMAN R. WILLSON, Jr., Worthington, Ohio, assignor to Joseph A. Jeffrey, Columbus, Ohio. Filed May 23, 1903. Serial No. 158,572.



Claim.—1. The combination with an elevator having swinging buckets, of a tilting device for the buckets, provided with an aperture, and means for positively moving the tilting device into and out of operative position arranged to enter said aperture in the tilting device, substantially as set forth.

2. The combination with an elevator having swinging buckets, of a tilting device for the buckets in which is formed an open slot, an eccentric mounted in the said slot and arranged to positively move the tilting device both into and out of operative position, and means for operating the eccentric, substantially as set forth.

3. The combination with an elevator having swinging buckets, of a tilting device for the buckets and an eccentric for moving the tilting device into operative position, the tilting device being arranged to positively arrest the movement of the eccentric when it has reached the proper working position, substantially as set forth.

4. The combination with an elevator having swinging buckets, of a tilting device and an eccentric for moving the tilting device to operative position, the eccentric having lateral engagement with the tilting device whereby the latter is held in proper alinement by the eccentric, substantially as set forth.

5. The combination with an elevator having swinging buckets, of a tilting device for the buckets provided with an aperture, and an eccentric mounted in the said aperture, and provided with peripheral flanges arranged to engage with the opposite sides of the lifting device, substantially as set forth.

6. The combination with a conveyor having swinging buckets, of a tilting device therefor having an aperture and an eccentric for moving the tilting device into operative position provided with peripheral flanges adapted to engage with the opposite faces of the lifting device, the eccentric being formed of two parts each of which carries one of the flanges, substantially as set forth.

7. The combination with a conveyor, having swinging buckets, of a tilting device for the buckets, and means for moving the tilting device into and out of operative position, said means being adapted to limit the upward movement of said tilting device as it comes into working position, substantially as set forth.

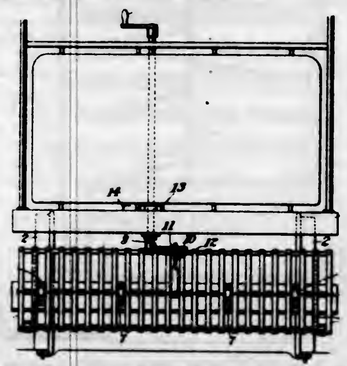
8. The combination with an elevator having swinging buckets, of a tilting device for the buckets, means for vertically moving the tilting device into and out of working position, and stops for positively limiting the movement of these parts when the tilting device arrives at working position and also when it is moved out of working position, substantially as set forth.

9. The combination with a conveyor having swinging buckets, of a tilting device for the buckets, and means for moving said device into and out of operation, said means adapted to arrest the movement of said tilting device relative to it in either direction when the said tilting device is in working position.

10. The combination with a conveyor having swinging buckets, of a tilting device for the buckets mounted on a horizontal axis and means for moving said device into and out of operation about the axis, said means being adapted to arrest the movement of said device relative to it in either direction about the axis when the device is in working position.

11. The combination with a conveyor having swinging buckets, of a tilting device for the buckets having front and rear cam-surfaces, and means arranged between the said cam-surfaces for moving the said tilting device into and out of operative position, substantially as set forth.

813,475. **CAR-FENDER.** ALBERT B. WELSH, New York, N. Y., assignor of one-fourth to Joseph M. Lazar, New York, N. Y. Filed Aug. 29, 1905. Serial No. 276,198.



Claim.—1. In a fender for railway-cars, the combination of a wheeled truck, a fender member pivotally connected thereto, a car-body over said truck and means independent of the brake-staff on said car-body extending above the platform, adapted to be controlled by the operator and connected to the fender member for positively moving said member into operative position, substantially as described.

2. In a fender for railway-cars, the combination of a wheeled truck, a fender member pivotally connected thereto, a car-body over said truck, means independent of the brake-staff on said car-body extending above the platform, adapted to be controlled by the operator and connected to the fender member for positively moving said member into operative position, and means for retaining said member in said operative position, substantially as described.

3. In a fender for railway-cars, the combination of a wheeled truck, a fender member pivotally connected at its center thereto, a car-body above said truck and means independent of the brake-staff on said body extending above the platform, adapted to be controlled by the operator and adjustably connected to the fender member for positively moving said member into operative position, substantially as described.

4. In a fender for railway-cars, the combination of a wheeled truck, a fender member pivotally connected at its center thereto, a car-body above said truck, means independent of the brake-staff on said body extending above the platform, adapted to be controlled by the operator and adjustably connected to the fender member for positively moving said member into operative position and means for retaining said member in said operative position, substantially as described.

5. In a fender for railway-cars, the combination of a wheeled truck, a fender member pivotally connected thereto, a car-body above said truck, a rotating hand-lever on said car-body, and a rigid connecting-link between said lever and said fender member for positively moving said member into either an operative or an inoperative position, substantially as described.

6. In a fender for railway-cars, the combination of a wheeled truck, a fender member pivotally connected thereto, a car-body above said truck, a rotating hand-lever on said car-body, a rigid connecting-link between said lever and said fender member for positively moving said member into either an operative or an inoperative position, and means for retaining said lever and fender member in operative position, substantially as described.

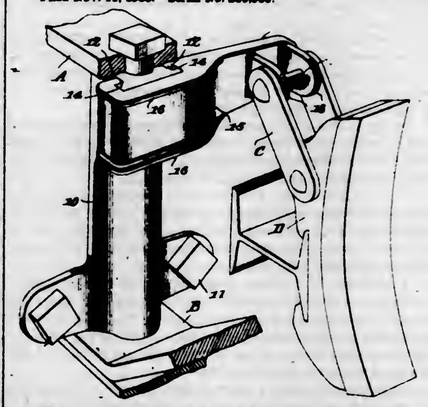
7. In a fender for railway-cars, the combination of a wheeled truck, a fender member pivotally connected at its center to said truck, a car-body above said truck, a rotating hand-lever upon said body independent of the brake-staff and an adjustable rigid link connection between said lever and said fender for positively moving said fender into operative position, substantially as described.

8. In a fender for railway-cars, the combination of a wheeled truck, a fender member pivotally connected at its center to said truck, a car-body above said truck a rotating hand-lever upon said car-body, an adjustable rigid link connection between said lever and said fender for positively moving said member into either an operative or an inoperative position, and a pawl-and-ratchet device for retaining said lever and fender member in said operative position, substantially as described.

9. In a fender for railway-cars, the combination of a wheeled truck, a fender member connected to said truck and arranged so as to be moved into operative position upon contact with an obstacle, a car-body over said truck and independent means on said car-body controlled by the operator and rigidly connected to the fender member for positively moving said member into operative position, substantially as described.

10. In a fender for railway-cars, the combination of a wheeled truck, a fender member connected to said truck and arranged so as to be moved into operative position upon contact with an obstacle a car-body over said truck, independent means on said car-body controlled by the operator and rigidly connected to the fender-member for positively moving said member into operative position, and means for retaining said member in said operative position, substantially as described.

813,476. **BRAKE-HANGER.** OWEN W. WITTHER, Columbus, Ohio. Filed Nov. 11, 1905. Serial No. 286,900.



Claim.—1. In combination, a bolster-guide column having a recess, a brake-hanger including an arm arranged to fit within said recess and provided with pivot-ears for the support of the brake-hanger links, said hanger being held from upward movement by the upper arch-bar.

2. In combination, a bolster-guide column having a recess, and a brake-hanger including an arm fitting within said recess and interlocking with the walls thereof to prevent horizontal movement in any direction.

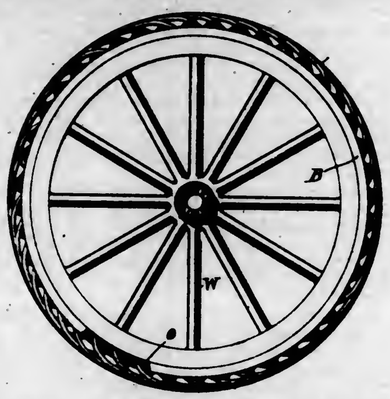
3. In combination, a bolster-guide column, the inner and outer faces of which are provided with vertical grooves, and a brake-hanger provided with a pair of spaced flanges arranged to enter said grooves.

4. In a device of the class specified, a bolster-guide column, the opposite edges of which are provided with vertical grooves open at the top, a brake-hanger having on its rear face a pair of flange members arranged to enter said grooves and confined in place by one of the upper truss-bars of the truck.

5. In a device of the class specified, a brake-hanger comprising an arm having on one face a pair of projecting flanges and provided on its opposite face with a pair of spaced pivot-ears, a bolster-guide

column provided with vertical grooves in its opposite edges, said grooves being open at the top to permit the insertion of the flanges, and means for holding the brake-hanger in position.

813,477. VEHICLE-WHEEL TIRE. CHARLES C. WESTERHOUSE, Dunellen, N. J. Filed Aug. 11, 1904. Serial No. 220,262.



Claim.—1. A vehicle-wheel tire comprising an inner circular band adapted to be secured to the body of a wheel and a surrounding resilient outer part consisting of a plurality of arched spring-rods secured diagonally across the peripheral face of said band with the ends of their respective arches located on said band at fixed distances apart and the mid-portions thereof constituting a resilient wheel-tread.

2. In a vehicle-wheel, a rotatable inner part and a surrounding resilient outer part composed of a plurality of arched spring-rods disposed diagonally across the peripheral face of said inner part and arranged closely together for mutual reinforcement of each other against lateral or transverse pressure.

3. In a vehicle-wheel, a rotatable inner part and a surrounding resilient outer part composed of a plurality of arched spring-rods arranged side by side in contact with each other and disposed diagonally across the peripheral face of said inner part.

4. In a vehicle-wheel, a rotatable inner part and a surrounding resilient outer part composed of a plurality of arched spring-rods disposed across the peripheral face of said inner part with their opposite ends seated respectively at fixed distances apart in apertures in the opposite edges of said rotatable inner part.

5. In a vehicle-wheel tire, an under tire consisting of a circular band having its opposite edges thickened or reinforced, and a plurality of diagonal spring-rods formed as arches with their respective ends located at fixed distances apart and secured respectively to the opposite reinforced edges of said under tire, the mid-portions of said rods constituting a resilient wheel-tread.

6. In a vehicle-wheel, a rotatable inner part and a surrounding resilient outer part consisting of a plurality of spring-rods formed as arches embracing the inner part and disposed diagonally across the peripheral face thereof, the respective ends of the arches being located on the inner part at fixed distances apart and their mid-portions forming a resilient tread, in combination with bends in said arched rods arranged to distribute the strain therein.

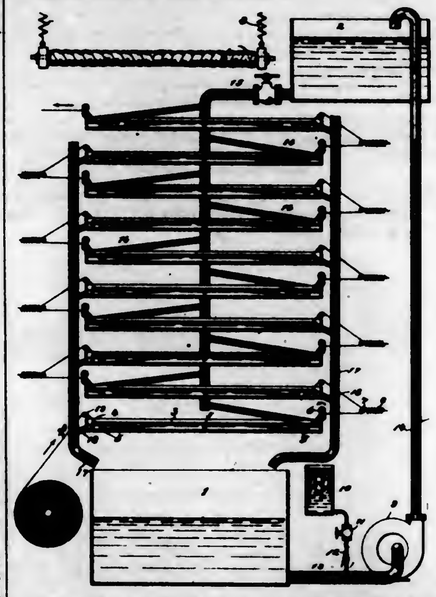
7. In a vehicle-wheel tire, a tread-surface composed of the mid-portions of a plurality of arched spring-rods disposed in diagonal position with respect to the tread, an inner part to which the ends of said rods are secured at fixed distances apart and spring-bends in said rods.

8. In a vehicle-wheel tire, a tread-surface composed of a plurality of diagonally-disposed spring-rods and an inner part to which said rods are secured, said rods being formed as arches with their respective ends located at fixed distances apart, in combination with jogs or bends in said rods intermediate their centers and ends.

9. In a vehicle-wheel, an inner part formed with flanged edges, in combination with a plurality of diagonal spring-rods in the shape of arches secured to said flanged edges at their opposite ends.

10. In a vehicle-wheel, an inner part of thin material having flanged edges and a series of perforations in said edges, in combination with a plurality of spring-rods diagonally disposed around said inner part and formed as arches with their respective opposite ends secured in said perforations.

813,478. DYEING APPARATUS. ERNST SELLHORN, Passaic, N. J. Filed Mar. 26, 1903. Serial No. 251,991.



Claim.—1. Apparatus for dyeing comprising a series of relatively shallow open superposed dyeing-trays and means for passing a piece of cloth successively through the trays of the series, and means for supplying dyeing liquid to the trays.

2. Apparatus for dyeing comprising a series of open superposed dyeing-trays and means for passing a piece of cloth successively through the trays of the series, in combination with means for continuously circulating dyeing liquid through the trays.

3. Apparatus for dyeing comprising a series of open superposed dyeing-trays and means for passing a piece of cloth successively through the trays of the series, in combination with means for continuously circulating dyeing liquid through the trays and means for inserting dyestuff in the circulating dyeing liquid.

4. Apparatus for dyeing comprising a series of open superposed dyeing-trays and means for passing a piece of cloth successively through the trays of the series, means for circulating dye liquid comprising a pump, and means for inserting dyeing material comprising piping leading to the circulating system on that side of the pump from which the liquid is fed to it.

5. An apparatus for dyeing comprising a plurality of open superposed dyeing-trays, means for passing the cloth successively through said trays, and means for feeding the dyeing liquid to each tray independently of the others and an outlet from each tray.

6. Apparatus for dyeing comprising a plurality of superposed dyeing-trays, means for feeding the dyeing liquid through the trays and means for passing the cloth successively through the trays in combination with a continuous circulating system for the dye-bath.

7. Apparatus for dyeing comprising a plurality of dyeing-trays, means for passing cloth successively through said trays, and means for feeding the dyeing liquid to each tray independently of the others at the end of said trays at which the cloth emerges, and an outlet from each tray at the other end thereof, whereby the flow of said liquid through said tray is contrary to the movement of said cloth therethrough.

8. An apparatus for dyeing comprising a plurality of dyeing-trays, means for passing cloth successively through said trays, and means for feeding the dyeing liquid to each tray independently of the others, and an outlet from each tray, and one or more rollers over which said cloth passes adapted to spread said cloth.

9. An apparatus for dyeing comprising a plurality of dyeing-trays, means for passing cloth successively through said trays, and means for feeding the dyeing liquid to each tray independently of the others, and an outlet from each tray, and one or more tension-rollers over which said cloth passes adapted to spread said cloth.

10. Apparatus for dyeing comprising a plurality of superposed dyeing-trays, means for feeding the dyeing liquid through the trays, means for passing the cloth successively through the trays, and a dyestuff-container provided with valved piping leading to said feeding means.

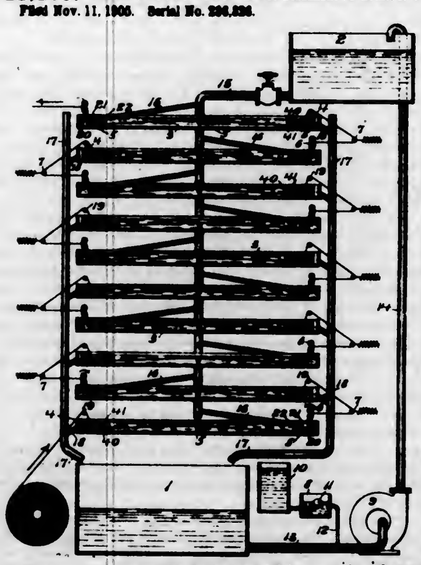
11. Apparatus for dyeing comprising a plurality of superposed trays, a tank above them and piping from the tank to the trays, a receiving-tank, piping from the trays leading thereto, means for feeding cloth first through one tray and then another, means for feeding the liquid from the receiving-tank to the feed-tank and means for inserting dyestuff into the liquid during its feed.

12. Dyeing apparatus comprising a feed-tank, a receiving-tank, a circulating pump and piping between them, supply-piping leading from said feed-tank, a number of superposed trays, each having a spring-roller and squeezing-rollers mounted adjacent to one end and rollers within each tray adapted to support the cloth, an inlet to each tray from the supply-piping and an outlet from each tray to the receiving-tank.

13. Dyeing apparatus comprising a number of trays, and means for passing cloth through the trays successively, means for stretching the cloth lengthwise and sidewise as it is passed therethrough, in combination with means for continuously passing a dyeing liquid through said trays.

14. Dyeing apparatus comprising a number of trays, means for passing cloth through the trays successively, in combination with supply-piping and a pump for continuous circulating dyeing liquid through the trays, and means for inserting dyestuff into the liquid as it comes from the pans whereby the same dye-bath may be used indefinitely.

813,479. DYEING APPARATUS. ERNST SELLHORN, Passaic, N. J. Filed Nov. 11, 1905. Serial No. 286,836.



Claim.—1. Apparatus for dyeing comprising a series of open relatively shallow superposed dyeing-trays and means for passing a piece of cloth successively through the trays of the series and means for supplying dyeing liquid to the trays, comprising at least two inlet-pipes one on each side of the line of travel of cloth during operation.

2. Apparatus for dyeing comprising a series of open relatively shallow superposed dyeing-trays and means for passing a piece of cloth successively through the trays of the series and means for supplying dyeing liquid to the trays, comprising at least two inlet-pipes one on each side of the line of travel of the cloth during operation, at least one pipe extending across the tray.

3. Apparatus for dyeing comprising a series of open relatively shallow superposed dyeing-trays and means for passing a piece of cloth successively through the trays of the series and means for supplying dyeing liquid to the trays, comprising at least two inlet-pipes one on each side of the line of travel of the cloth during operation, and outlets from each tray one on one side of the line of travel of the cloth and the other on the opposite side.

4. A dyeing vessel comprising a relatively shallow horizontal open pan, means to permit the passage of cloth to be dyed therethrough, at least two pipes for admitting dyeing liquid to said pan one on each side of the line of travel of the cloth therethrough.

5. A dyeing vessel comprising a relatively shallow horizontal open pan, means to permit the passage of cloth to be dyed therethrough, at least two pipes for admitting dyeing liquid to said pan one on each side of the line of travel of the cloth therethrough at least one pipe extending across the tray.

6. A dyeing vessel comprising a relatively shallow horizontal open pan, means to permit the passage of cloth to be dyed therethrough, at least two pipes for admitting dyeing liquid to said pan one on each side of the line of travel of the cloth therethrough, and two outlet-openings one on each side of the line of travel of said cloth.

7. A dyeing vessel comprising a relatively shallow horizontal open pan, means to permit the passage of cloth to be dyed therethrough, at least two pipes for admitting dyeing liquid to said pan one on each side of the line of travel of the cloth therethrough, an outlet-opening from said vessel and a baffle-chamber adapted to connect such outlet-opening with the bottom of the pan.

8. A dyeing vessel comprising a relatively shallow horizontal open pan, means to permit the passage of cloth to be dyed therethrough, at least two pipes for admitting dyeing liquid to said pan one on each side of the line of travel of the cloth therethrough, an outlet-opening from said vessel and a baffle-chamber adapted to connect such outlet-opening with the bottom of the pan, and a second outlet-opening adapted to connect the top of pan.

9. A dyeing vessel comprising a relatively shallow horizontal open pan, means to permit the passage of cloth to be dyed therethrough, at least two pipes for admitting dyeing liquid to said pan one on each side of the line of travel of the cloth therethrough, an outlet-opening from said vessel and a baffle-chamber adapted to connect such outlet-opening with the bottom of the pan, said second opening comprising a trough across said pan.

10. Apparatus for dyeing comprising a plurality of superposed dyeing-trays, means for feeding the dyeing liquid through the trays, means for passing the cloth successively through the trays, and a dyestuff-container provided with valved piping leading to said feeding means, and means for maintaining a substantially constant head of liquid in said piping.

11. Apparatus for dyeing comprising a plurality of superposed dyeing-trays, means for feeding the dyeing liquid through the trays, means for passing the cloth successively through the trays, and a dyestuff-container provided with valved piping leading to said feeding means, an auxiliary chamber in said piping and means for maintaining a substantially constant head in said chamber.

12. Apparatus for dyeing comprising a plurality of superposed dyeing-trays, means for feeding the dyeing liquid through the trays, means for passing the cloth successively through the trays, and a dyestuff-container provided with valved piping leading to said feeding means, an auxiliary chamber and a float-valve adapted to maintain a substantially constant head in said chamber.

813,480. ACTION FOR MECHANICAL MUSICAL INSTRUMENTS. ADALBERT ZOLLINGER, Leipsic-Reudnitz, Germany, assignor to Popper & Co., Leipsic, Germany. Filed Apr. 20, 1904. Serial No. 203,503.

Claim.—1. In an action for mechanical musical instruments, the combination with a continuously-oscillating jack or hopper device, of pivoted angle levers or butts, a hammer fixed to one arm of each angle-lever, means connected with the other arm for normally holding the lever out of the path of the jack, and means for actuating each lever separately and bringing them into the path of the jack according to the note to be struck.

2. In an action for mechanical musical instruments, the combination with a continuously-oscillating jack or hopper device, of pivoted angle levers or butts, a hammer fixed to one arm of each lever, a spring connected to the other arm and adapted to withdraw it from the path of the jack, and pneumatically-controlled mechanism flexibly connected with each lever and adapted to bring the butts separately into the path of the jack according to the note to be struck.

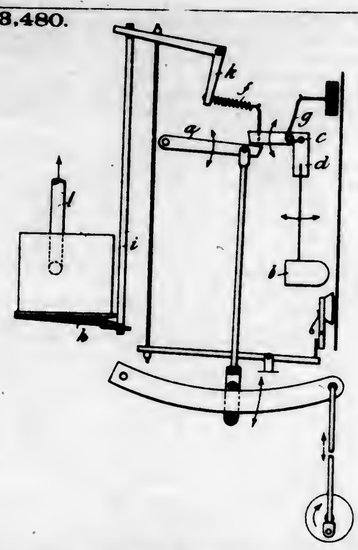
813,480.

means for journaling a roll of paper on one side wall, in combination

chain for feeding a can-body upon the platform, means for raising

a bridge-wall separating the furnace from the oven, laterally-dis-

818,480.



818,481. TENSION-REGULATING DEVICE FOR AUTOGRAPHIC REGISTERS. ENGLAND J. BARKER, Morgan Park, Ill. Filed Sept. 11, 1903. Serial No. 277,963.

Claim.—1. In a machine of the kind specified, a roll of paper; means for supporting said roll of paper, comprising a journaling device that is movable to and from the end of said roll; and a contrivance supported by said journaling device for equalizing the resistance to the unwinding of the paper from said roll.

2. In a machine of the kind specified, a roll of paper; means for supporting said roll of paper, comprising a pivoted journaling device that is movable to and from the end of said roll; and a contrivance supported by said journaling device for equalizing the resistance to the unwinding of the paper from said roll.

3. In a machine of the kind specified, a roll of paper; means for supporting said roll of paper, comprising a pivoted spring-actuated journaling device that is movable to and from the end of said roll; and an automatic contrivance supported by said journaling device for equalizing the resistance to the unwinding of the paper from said roll.

4. In a machine of the kind specified, a roll of paper; means for supporting said roll of paper, comprising a spring-actuated journaling device pivoted at one end and which is movable to and from the end of said roll, and an adjustable contrivance supported by said journaling device for equalizing the resistance to the unwinding of the paper from said roll.

5. In a machine of the kind specified having opposite side walls, means for journaling a roll of paper on one side wall, in combination with a pivoted arm adjacent to the opposite side wall, means connected thereto for journaling the adjacent end of said roll of paper, and devices for regulating the pressure of said arm toward said roll.

6. In a machine of the kind specified having opposite side walls, means for journaling a roll of paper on one side wall, in combination with a pivoted arm adjacent to the opposite side wall, means connected thereto for journaling the adjacent end of said roll of paper, and automatic devices for regulating the pressure of said arm toward said roll.

7. In a machine of the kind specified having opposite side walls, means for journaling a roll of paper on one side wall, in combination with a pressure-arm pivoted at one end to the opposite wall, means carried thereby for journaling the adjacent end of said roll of paper, and a lever pivoted to said arm and engaging said roll and regulates the pressure of said arm against said roll.

8. In a machine of the kind specified having opposite side walls, means for journaling a roll of paper on one side wall, in combination with an arm pivoted at one end to the opposite wall, means carried thereby for journaling the adjacent end of said roll of paper, and a lever pivoted to said arm, a spring bearing against said lever which latter engages said roll and regulates the pressure of said arm against said roll.

9. In a machine of the kind specified having opposite side walls, means for journaling a roll of paper on one side wall in combination with a pressure-arm pivoted at one end to the opposite side wall, having means for journaling the adjacent end of said roll of paper and provided with a longitudinally-elongated slot therein and a lever pivoted to said arm and extending through said slot therein and adapted to engage the circumference of said roll and regulate the pressure of said arm against the roll.

10. In a machine of the kind specified having opposite side walls, means for journaling a roll of paper on one side wall, in combination with an arm pivoted at one end to the opposite side wall, means carried by the arm for journaling the adjacent end of said roll of paper, said arm having a longitudinally-elongated slot therein, a lever pivoted to said arm and extending through said slot, and a spring engaging said lever whereby said lever is adapted to bear against the circumference of said roll and regulate the pressure of said arm as the roll diminishes in diameter.

11. In a machine of the kind specified having opposite side walls, means for journaling a roll of paper on one side wall in combination with an arm pivoted at one end to the opposite side wall, means carried by the arm for journaling the adjacent end of said roll of paper, said arm having a longitudinally-elongated slot, and a lever pivoted to said arm which extends through said slot, and a coil-spring interposed between said lever and side wall of the machine which causes said lever to engage the circumference of said roll of paper and regulate the pressure of said arm against the same.

12. In a machine of the kind specified having opposite side walls, means for journaling a roll of paper on one side wall, in combination with an arm pivoted at one end to the opposite side wall, means carried by the arm for journaling the adjacent end of said roll of paper, said arm having a longitudinally-elongated slot, and a lever pivoted to said arm which extends through said slot and a bolt pivotally connected at its inner end to said lever and extending through the side wall of the machine, and a coil-spring surrounding said bolt between the lever and the adjacent side wall.

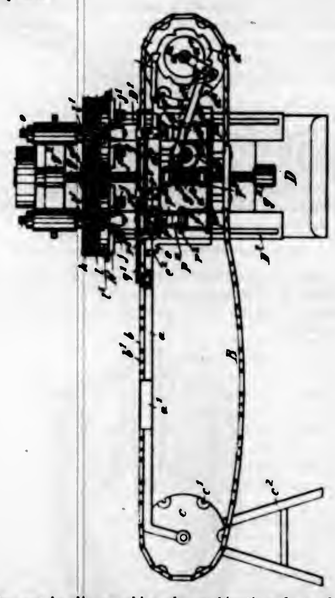
13. In a machine of the kind specified having opposite side walls, means for journaling a roll of paper on one side wall, in combination with an arm pivoted at one end to the opposite side wall, means carried by the arm for journaling the adjacent end of said roll of paper, said arm having a longitudinally-elongated slot, and a lever pivoted to said arm which extends through said slot and a longitudinally-extensible bolt pivotally connected at its inner end to said lever and extending through the side wall of the machine, and a coil-spring surrounding said bolt between the lever and the adjacent side wall.

14. In a machine of the kind specified having opposite side walls, means for journaling a roll of paper on one side wall, in combination with an arm pivoted at one end to the opposite side wall, means carried thereby for journaling the adjacent end of said roll of paper, a lever pivoted to said arm, a bolt pivoted at its inner end to said lever and extending laterally out through a suitable opening in said side wall, and a spring surrounding said bolt between said lever and said side wall.

15. In a machine of the kind specified having opposite side walls, means for journaling a roll of paper on one side wall, in combination with an arm pivoted at one end to the opposite side wall, means carried thereby for journaling the adjacent end of said roll of paper, a lever pivoted to said arm, a longitudinally-extensible bolt pivoted at its inner end to said lever and extending laterally out through a suitable opening in said side wall, and a spring surrounding said bolt between said lever and said side wall.

818,482. CAN-HEADING MACHINE. JULIUS BIENENFELD, New York, N. Y., assignor to The Max Ams Machine Co., New York, N. Y., a Corporation of New York. Filed June 16, 1904. Serial No. 212,764.

Claim.—1. In a can-heading machine, the combination of a recessed table, with a vertically-movable platform seated therein, a chain for feeding a can-body upon the platform, means for raising and lowering the platform, a chuck above the platform, a series of seaming-rollers surrounding the chuck, and means for imparting a simultaneous rotatory and radial movement to said rollers, substantially as specified.



2. In a can-heading machine, the combination of a track with a feed-apron, a vertically-movable platform, a pair of guide-rails having diverging ends, a gage, and means for reciprocating said gage at right angles to the feed-apron, substantially as specified.

3. In a can-heading machine, the combination of a wheel having a cam-groove with a second wheel having radial guides, slides movable therein, seaming-rollers journaled in the slides, cam-rollers connected to the slides means for and engaging the cam-groove, and rotating the wheels at different speeds, substantially as specified.

4. In a can-heading machine, the combination of a shaft having a chuck and a collar, with a lower wheel rotatively supported on the collar and having radial guides, slides engaging said guides, seaming-rollers journaled in the slides, an upper wheel rotatively supported upon the lower wheel and having a cam-groove, cam-rollers connected to the slides and engaging said groove, and means for rotating the wheels at different speeds, substantially as specified.

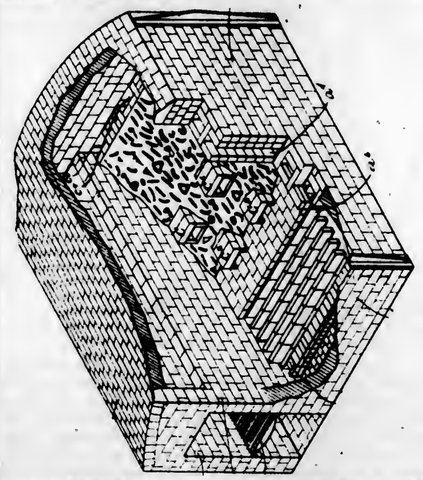
5. In a can-heading machine, the combination of a wheel having a radial guide, with a slide engaging the same and composed of an upper section and a lower section, means for radially adjusting the lower section along the upper section, and a seaming-roller journaled to said lower section, substantially as specified.

6. In a can-heading machine, the combination of a track with a feed-apron, a vertically-movable platform, a chuck above the same, a lower gear-wheel rotatable above the platform, radially-movable slides engaging said wheel, seaming-rollers journaled to the slides, an upper gear-wheel having a cam-groove, cam-rollers connected to the slides and engaging said groove, and means for rotating the wheels at different speeds, substantially as specified.

813,483. ANNEALING OR MALLEABLEIZING OVEN. WILLIAM L. CASADAY and AUGUST BUSSMAN, South Bend, Ind. Filed June 23, 1904. Serial No. 213,769.

Claim.—1. In a casting-treating oven in which the castings to be treated are packed without pots, a fire-grate, a bridge-wall separating the grate from the oven, a plurality of flues extending longitudinally of the oven, a plurality of transverse flues beneath the oven and a plurality of flues leading upwardly therefrom in the side wall and opening into the upper portion of the oven.

2. A malleableizing and annealing oven comprising in combination, side and end walls, a closed roof, a furnace adjacent the oven, a bridge-wall separating the furnace from the oven, laterally-disposed down-flues opposite the bridge-wall, horizontal transverse flues below the floor and communicating with said down-flues, a longitudinal flue positioned adjacent the bridge-wall and communicating with the stack and into which the transverse flues open near each end of the oven, a bridge-wall at each end of said oven, flues built upon the floor of the oven and opening through said bridge-walls and communicating at one end with the stack and longitudinal flues communicating at their ends through said bridge-walls and opening into the stack and adapted to be supported upon and bedded in the material to be treated and a damper in each of said flues leading to the stack adapted to regulate the draft therethrough, said end walls having normally closed apertures in alinement with the flues affording means for inspection.



3. A malleableizing and annealing oven comprising in combination, side and end walls, a furnace therein, a bridge-wall separating the furnace from the oven, laterally-disposed down-flues opposite the bridge-walls, horizontal transverse flues communicating therein beneath the floor, a longitudinal flue positioned adjacent the bridge-wall and communicating with the transverse flues and opening from each and into the stack, a bridge-wall at each end of said oven, flues built upon the floor of the oven and opening through said bridge-walls and communicating at one end with the stack, and longitudinal flues communicating at their ends through said bridge-walls and opening into the stack and adapted to be supported upon and to be embedded in the material to be treated and a damper controlling each of said flues leading to the stack, the walls having normally closed view-apertures in alinement with each of said longitudinal flues adapted to permit inspection.

4. In an oven for treating castings, a fire-box, an inclosed oven in which the castings to be treated are packed, a bridge-wall between the fire-box and said oven adapted to direct heat over said castings, a plurality of flues opening into the side wall from the top of the oven and leading downwardly therethrough, lateral flues beneath the oven connecting therewith, longitudinal flues embedded in the packing material, a stack and flues leading from the oven to said stack.

5. In an annealing-furnace, a fire-box at one side thereof, an oven, a plurality of vertical flues at one side of the oven, a plurality of horizontal flues beneath the oven in communication with said vertical flues, a common longitudinally-disposed flue beneath the oven in communication with each of the said horizontal flues, a plurality of vertical flues at the ends of the oven, and a plurality of auxiliary flues in communication at each end with the vertical flues at the ends of the oven, substantially as specified.

6. In an annealing-furnace the combination with an oven, of a fire-box at one side thereof, a plurality of vertical flues at the opposite side of the oven, means extending beneath the oven and connected with said flues adapted to carry off the product of combustion, vertical flues at the ends of the oven, a chamber above the oven communicating with the vertical flue at the front end of the oven and a plurality of flues extending longitudinally through the oven and communicating with said front and rear vertical flues.

818,484. STONE-SAW. JOSHUA D. CLEVENGER, San Francisco, Cal., assignor of one-half to Archibald H. MacIntyre, San Francisco, Cal. Filed May 15, 1905. Serial No. 260,696.

2. In a slide-rule a straight transparent cylindrical tube, fixed and sliding scales therein and an index sliding thereon, formed of

the top thereof so the steam entering at the bottom will heat the inner wall, said inner wall having a reduced lower portion, a separator-

tube, a gas-supply cock, an inspirator-nozzle, carried thereby, a screen carried by the inspirator-nozzle, and means for adjusting the

813,484. STONE-SAW. JOSHUA D. CLEVERDON, San Francisco, Cal., assignor of one-half to Archibald H. MacNutt, San Francisco, Cal. Filed May 16, 1905. Serial No. 261,066.

Claim.—1. The combination of a stone-saw blade comprising an upper section and a lower section, said upper section being thinner throughout than the lower section, and said blade having a plurality of notches, said notches forming arches within said upper section, from the ends whereof said notches incline inwardly in said lower section and then curve outwardly to the base of said lower section, and the edges of such notches in such lower section where such outward curvature begins to the base of said blade having V-shaped depressions to convey abrasive matter to the cutting edges, substantially as described.

2. The combination of a stone-saw blade comprising an upper section and a lower section, said upper section being thinner than said lower section so as to allow the descent of abrasive matter to the lower section, and said blade having a plurality of notches extending into and from said upper section through said lower section, and such notches from the base of the upper section being arranged to allow the further descent of abrasive matter and sloping outwardly to the base of the lower section, and the edges of such notches in such lower section where such outward slope begins to the base of said blade being slotted to convey abrasive matter to the cutting edges.

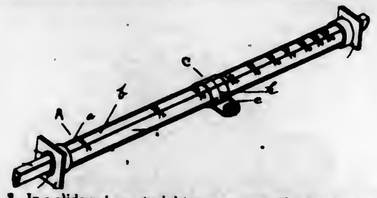
3. The combination of a stone-saw blade comprising an upper section and a lower section, said upper section being thinner than said lower section and having at its base an inclined shoulder on each side thereof extending to said lower section, and said blade having a plurality of notches extending into and from said upper section through said lower section, and such notches from the base of the upper section being inclined inwardly and then sloping outwardly to the base of the lower section, and the edges of said notches in such lower section where such outward slope begins to the base of said blade having V-shaped depressions to convey abrasive matter to the cutting edges, substantially as described.

4. A stone-saw blade comprising a lower section and an upper section thinner than said lower section and having a plurality of notches therein extending from the interior of said upper section to the base of said lower section, the sides of which notches in said lower section being channeled to permit abrasive matter to descend therein.

813,485. SLIDE-RULE. BENJAMIN D. COPPAGE, Wilmington, Del. Filed Mar. 21, 1904. Serial No. 199,097.

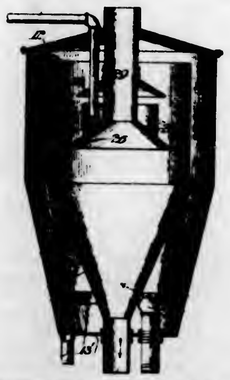
Claim.—1. In a slide-rule, a straight transparent cylindrical tube, an interrupted cylindrical tube, with scales thereon, fixed within said transparent tube and a straight slide therein having a side, with scales thereon, equivalent in width to the chord of the missing arc of the said fixed scale-tube.

2. In a slide-rule a straight transparent cylindrical tube, fixed and sliding scales therein and an index sliding thereon, formed of transparent celluloid, secured around said tube by means of a rivet through extensions from tangential portions of said index.



3. In a slide-rule, a straight transparent cylindrical tube, fixed and sliding scales within said tube, elastic rubber guards on each end of said tube, to protect it from shock.

813,486. STEAM-CONDENSER. JAMES A. DILLON, Chicago, Ill., assignor, by mesne assignments, of one-half to National Laundry Machinery Co., Chicago, Ill., a Corporation. Filed June 26, 1905. Serial No. 267,913.



Claim.—1. In a condenser the combination of a casing having a chamber therein for the passage of steam, a steam-inlet near the bottom thereof, a wall within said chamber in which a condensing-chamber is formed, said chambers being in communication with each other near the top thereof so the steam entering at the bottom will heat the water flowing through the condensing-chamber before the steam passes into the condensing-chamber, and a pipe for conducting water to the condensing-chamber.

2. In a condenser the combination of a casing having a chamber therein for the passage of steam, a steam-inlet near the bottom thereof, a wall within said chamber in which a condensing-chamber is formed, a separator-pocket around the condensing-chambers, said chambers being in communication with each other near the top thereof so the steam entering at the bottom will heat the inner wall, and a pipe for conducting water to the condensing-chamber.

3. In a condenser the combination of a casing having a chamber therein for the passage of steam, a separator-pocket near the bottom of the casing, a wall in said chamber in which a condensing-chamber is formed, said chambers being in communication with each other near the top thereof so the steam entering at the bottom will heat the inner wall and the water therein, a pipe for conducting water to the condensing-chamber, and an oil-pipe connected to the bottom of the casing.

4. In a condenser the combination of a casing having a chamber therein for the passage of steam, a steam-inlet near the bottom thereof, a separator-pocket near the bottom of the casing, a wall in said chamber in which a condensing-chamber is formed, said chambers being in communication with each other near the top thereof so the steam entering at the bottom will heat the inner wall and the water therein, and a pipe for conducting water to the condensing-chamber.

5. In a condenser the combination of a casing having a chamber therein for the passage of steam, a steam-inlet near the bottom thereof, a wall in said chamber and in which a condensing-chamber is formed, said chambers being in communication with each other near

the top thereof so the steam entering at the bottom will heat the inner wall, said inner wall having a reduced lower portion, a separator-pocket around said reduced portion, and a pipe for conducting water to the condensing-chamber.

6. In a condenser the combination of a casing having a chamber therein for the passage of steam, a steam-inlet, a wall in said chamber in which a condensing-chamber is formed, said chambers being in communication with each other, a wall in the steam-chamber extending around the lower portion of said wall and forming a pocket around said wall, and a pipe for supplying water to the condensing-chamber.

7. In a condenser the combination of a casing having a chamber therein for the passage of steam, a steam-inlet, a wall in said chamber in which the condensing-chamber is formed, said chambers being in communication with each other, a wall extending around the lower portion of and forming a pocket around the wall of the condensing-chamber, and a channel formed at the lower edge of said pocket-wall.

8. In a condenser the combination of a casing having a chamber therein for the passage of steam, a steam-inlet, a wall in said chamber in which the condensing-chamber is formed, said chambers being in communication with each other, a wall extending around the lower portion of and forming a pocket around the wall of the condensing-chamber, a channel formed at the lower edge of said pocket-wall, and a discharge-pipe for the oil leading from said channel.

9. In a condenser the combination of a casing within which a steam-chamber is formed, an inner wall within which a condensing-chamber is formed and extending to a point near the top of the condenser, a steam-inlet near the bottom of the condenser, a water-outlet pipe connected to the bottom of the condensing-chamber, and a water-supply pipe leading to the condensing-chamber and whereby the steam in the steam-chamber will pass upwardly from the bottom around the wall of the condensing-chamber before it passes into the condensing-chamber.

10. In a condenser the combination of a casing, a pipe for supplying steam near the bottom thereof, an inner wall within which a condensing-chamber is formed and around which a steam-chamber is formed, a supply-pipe for water, and a spreader-plate in said condensing-chamber onto which the water is discharged from the supply-pipe.

11. In a condenser the combination of a casing, a pipe for admitting steam, an inner wall within which a condensing-chamber is formed and around which a steam-chamber is formed, a supply-pipe for water, and a spreader-plate in said condensing-chamber onto which the water is discharged from said supply-pipe, said spreader being provided with a perforated flange or wall.

12. In a condenser the combination of a casing, a pipe for admitting steam, an inner wall within which a condensing-chamber is formed and around which a steam-chamber is formed, a supply-pipe for water, and a spreader-plate in said condensing-chamber onto which the water is discharged from said supply-pipe, said plate being provided with an upwardly-extending wall having perforations therein and over which the water can flow.

13. In a condenser the combination of a casing having a pipe for supply-steam, an inner wall within which the condensing-chamber is formed and around which a steam-chamber is formed, a supply-pipe for water, a spreader-plate in said condensing-chamber onto which the water is discharged from the supply-pipe, and a hood above said spreader-plate.

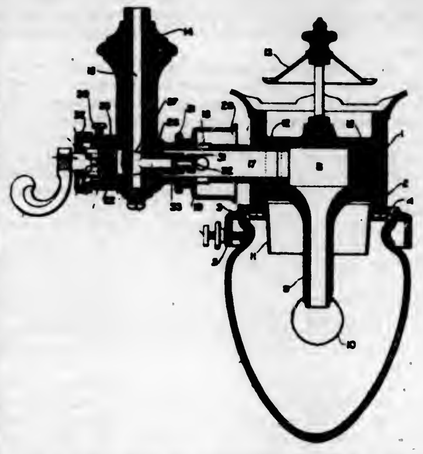
14. In a condenser the combination of an outer wall or casing having a chamber therein for the passage of steam, a steam-inlet near the bottom thereof, a wall within said chamber in which a condensing-chamber is formed, said chambers being in communication with each other near the top thereof so the steam entering at the bottom will heat the inner wall and the water therein, a pipe for conducting water to the condensing-chamber, and a spreader-plate in the condensing-chamber for directing the water into contact with the inner wall.

813,487. GAS-LAMP. ROBERT M. DIXON, East Orange, N. J., assignor to The Safety Car Heating & Lighting Company, a Corporation of New Jersey. Filed May 6, 1905. Serial No. 259,156.

Claim.—1. In a gas-lamp, in combination, a gas-supply cock, an inspirator-nozzle carried thereby, and a screen carried by the inspirator-nozzle.

2. In a gas-lamp, in combination, an adjustable gas-supply cock, an inspirator-nozzle carried thereby, and a screen carried by the inspirator-nozzle.

3. In a device of the class described, in combination, a mixing-tube, a gas-supply cock, an inspirator-nozzle, carried thereby, a screen carried by the inspirator-nozzle, and means for adjusting the gas-supply cock in the mixing-tube.



4. In a device of the class described, in combination, a mixing-tube, a gas-supply cock, a shaft extending from said gas-supply cock, and means on the shaft for adjusting the gas-supply cock in the mixing-tube.

5. In a device of the class described, in combination, a gas-supply cock, a shaft extending therefrom, said gas-supply cock being provided with a shoulder, a spring located upon the shaft, a collar also located upon the shaft and fixed against rotation, and means coacting with the collar upon the spring to regulate the tension of the same to hold the gas-supply cock in adjustment.

6. In a device of the class described, in combination, a lamp-body, an incandescent mantle arranged therein, a fixture secured to the lamp-body and adapted to provide a gas-supply for the lamp, means located in the fixture for regulating the gas-supply, an extension on the fixture, a sleeve carried by the extension, and means carried by the sleeve for holding the gas-regulating means in adjustment in the fixture.

7. In a device of the class described, in combination, a lamp-body, an incandescent mantle arranged therein, a fixture secured to the lamp-body and adapted to provide a gas-supply for the lamp, means located in the fixture for regulating the gas-supply, an extension on the fixture, a sleeve located upon the extension, and a cap carried by the sleeve and adapted to maintain the gas-regulating means on the fixture.

8. In a device of the class described, in combination, a lamp-body, an incandescent mantle arranged therein, a fixture secured to the lamp-body and adapted to provide a gas-supply to the lamp, means located in the fixture for regulating the gas-supply, an extension on the fixture, a sleeve mounted upon the extension, a cap adjusted upon the sleeve and maintaining the gas-regulating means in the adjusted position.

9. In a device of the class described, in combination, a lamp-body, an incandescent mantle arranged therein, a fixture secured to the lamp-body and adapted to provide a gas-supply to the lamp, means located in the fixture for regulating the gas-supply, an extension on the fixture, a sleeve mounted upon the extension, a cap carried by the sleeve and adapted to be initially adjusted thereto to determine the adjustment of the gas-regulating means, and means for permanently securing the cap to the sleeve.

10. In a device of the class described, in combination, a lamp-body, an incandescent mantle arranged thereon, a fixture secured to the lamp-body and adapted to provide a gas-supply to the lamp, means located in the fixture for regulating the gas-supply, an extension on the fixture, a shaft carried by the gas-regulating means, a collar slidably mounted upon said shaft, and means carried by the extension acting upon the collar located upon the shaft for holding said gas-regulating means in adjustment in the fixture.

11. In a device of the class described, in combination, a lamp-

body, an incandescent mantle arranged therein, a fixture secured to the lamp and adapted to provide a gas-supply to the lamp, means located in the fixture for regulating said gas-supply, a shaft extending from said gas-supplying means, a collar encircling said shaft, a spring also encircling said shaft, and means on the fixture and operating upon the spring through said collar to regulate the tension thereof to maintain the gas-regulating means in adjustment in the fixture.

12. In a device of the class described, in combination, a lamp-body, an incandescent mantle arranged therein, a fixture secured to the lamp-body and adapted to supply gas to the lamp, means located in the fixture for regulating said gas-supply, a shaft extending from the gas-regulating means, a spring encircling said shaft, a split ring also encircling said shaft and adapted to slide thereon and engage the spring, and means carried by the fixture and coacting with said split ring to maintain the gas-regulating means in adjustment in the fixture.

13. In a device of the class described, in combination, a lamp-body, an incandescent mantle arranged therein, a fixture secured to the lamp and adapted to supply gas to the lamp, means located in the fixture for regulating said gas-supply, a shaft extending from said gas-regulating means, a spring and a ring encircling said shaft, an extension carried by the fixture, and means mounted upon the extension and coacting with the ring to regulate the tension of the spring, thereby maintaining the gas-regulating means in adjustment in the fixture.

14. In a device of the class described, in combination, a lamp-body, an incandescent mantle arranged therein, a fixture secured to the lamp-body and adapted to provide a gas-supply for the lamp, means located in the fixture for regulating said gas-supply, a shaft extending from the gas-regulating means, a spring and a split ring encircling said shaft, an extension on the fixture, a cap carried by the extension and adapted to be initially adjusted thereon to regulate the tension of the spring through the medium of said split ring to determine the adjustment of the gas-regulating means, and means for permanently securing said cap to said sleeve.

15. In a device of the class described, in combination, a lamp-body, an incandescent mantle arranged therein, a fixture secured to the lamp-body and adapted to provide a gas-supply to the lamp, means located in the fixture for regulating said gas-supply, a shaft extending from the gas-regulating means, a spring and a split ring encircling said shaft, an extension on the fixture, a sleeve mounted upon the extension, a cap carried by the sleeve and adapted to be initially adjusted thereon to determine the tension of the spring, thereby maintaining the gas-regulating means in adjustment, means for permanently securing said cap to said sleeve after such initial adjustment, and means carried by the sleeve engaging the extension for securing all the parts in permanent adjustment.

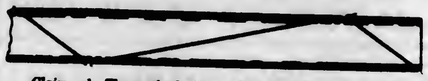
16. In a device of the class described, in combination, a lamp-body, a mantle secured therein, gas-regulating means carried by the lamp-body, a detachable nozzle carried by the gas-regulating means and a screen carried by the detachable nozzle.

17. In a device of the class described, in combination, a lamp-body, a mantle secured therein, a fixture carried by the lamp-body and adapted to provide a gas-supply to the lamp, gas-regulating means located in the fixture, a detachable inspirator-nozzle carried by the gas-regulating means, a screen carried by the inspirator-nozzle, and means carried by the fixture for maintaining the gas-regulating means in adjustment in the fixture.

18. In a device of the class described, in combination, a lamp-body, a mantle arranged therein, a fixture secured to the lamp-body and adapted to provide a gas-supply to the lamp, gas-regulating means located in the fixture, a detachable inspirator-nozzle carried by the gas-regulating means, a screen provided in the detachable inspirator-nozzle, means for maintaining the gas-regulating means in adjustment in the fixture, and single means adapted to be operated to allow the removal of the gas-regulating means, the detachable nozzle, and the adjusting means from the fixture.

19. In a device of the class described, in combination, a lamp-body, a fixture detachably connected thereto and adapted to conduct gas therein said fixture being provided with a gas-conducting conduit extending therefrom and being also provided with a second conduit intercepting the first-mentioned conduit above the lower end thereof to form a trap thereby in the lower end of said first-mentioned conduit adapted to collect foreign matter from the gas before the same enters the lamp-body, a gas-regulating cock arranged at the intersection of said conduits, and a detachable plug for closing the trap whereby the same may be cleaned without disturbing the other parts of the fixture.

813,488. STEEL SIDE STAKE FOR CARS. DUNAN I. DOBBS, Avalon, Pa., assignor to The Pullman Company, Chicago, Ill., a Corporation of Illinois. Filed June 14, 1904. Renewed June 24, 1905. Serial No. 266,849.

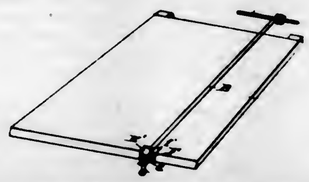


Claim.—1. The method of manufacturing side or end stakes for cars from rolled beams having flanges at their opposite sides, which consists in dividing said beams by means of cuts which intersect each other just outside the said flanges.

2. The method of manufacturing side or end stakes for cars from rolled beams having flanges at their opposite sides, which consists in dividing said beams by means of cuts which intersect each other just outside the said flanges and afterward cutting off the small segment of flange at one side.

3. A side or end stake for cars, consisting of a member having a T-shaped cross-section, the construction being such that the web flares from each end toward an intermediate point along the web and is cut parallel to the base of the T through a portion of the web.

813,489. WORK-HOLDER FOR FLAT-PLATEN TYPE-WRITERS. GEORGE W. DOBBINS, East Orange, N. J., assignor to Harry T. Ambrose, Orange, N. J. Filed Feb. 6, 1904. Serial No. 192,408.



Claim.—1. In a flat-platen type-writer, the combination with the flat platen thereof; of a flexible paper-clamp adapted to be disposed across the flat platen, a holder laterally adjustable with reference to the platen, and a vertically-adjustable pin carried by the holder and carrying one end of the clamp.

2. In a flat-platen type-writer, the combination with the flat platen thereof; of a flexible paper-clamp adapted to be disposed across the flat platen, a bracket having clips permitting its lateral adjustment with reference to the platen while retaining it in one horizontal plane, and a vertically-slidable member mounted in the holder and carrying one end of the clamp.

3. The combination with the flat platen of a type-writer; of a flexible paper-clamp adapted to be disposed across the flat platen, of a clip having forwardly-projecting horizontal spaced arms constructed to embrace the edge of the platen and rearwardly-projecting horizontal spaced arms provided with upright perforations, of a pin slidable in said perforations and carrying one end of said clamp, and of means for retaining the pin at any one of a plurality of elevations.

4. In a flat-platen writing-machine, the combination with the flat platen thereof; of a tensioned paper-holding clamp adapted to be disposed across the platen, a vertically-adjustable friction-retained carrier for one end of the clamp, and a vertical bearing in which said carrier slides and is maintained at varying elevations by the tension of the clamp.

5. In a flat-platen writing-machine, the combination with the flat platen thereof; of a flexible spring-actuated paper-holding tape passing across the platen, a vertically-adjustable friction-retained carrier for one end of the tape, and a holder in which the carrier is maintained at varying elevations by the tension of the tape.

6. In a flat-platen type-writer, the combination with the flat platen thereof; of a flexible paper-clamp elastic in the direction of its length and adapted to be disposed across the flat platen, means supporting one end of the clamp, an adjustable device carrying the other end of the clamp, and an upright bearing in which said adjustable device slides.

7. In a flat-platen type-writer, the combination with the flat platen thereof, and a flexible paper-clamp elastic in the direction of its length disposed across the platen; of a member laterally adjustable with reference to the platen carrying one end of the clamp, a device adjustable up or down carrying the other end of the clamp, and an upright laterally-adjustable bearing in which said device slides.

8. In a flat-platen type-writer, the combination with the flat platen thereof, and a flexible paper-clamp elastic in the direction of its length and adapted to be disposed across the flat platen; of means supporting one end of the clamp, an adjustable device carrying the other end of the clamp, an upright bearing in which said device slides, and means for retaining said device at its several elevations.

9. In a flat-platen type-writing machine, the combination with the flat platen thereof; of a tensioned paper-holding clamp disposed across the platen, a holder having an upright bearing, and a device carrying one end of the clamp and retained by the tension thereof at varying elevations in said bearing.

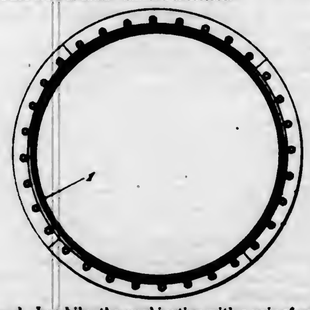
10. In a flat-platen type-writing machine, the combination with the flat platen thereof, and a tensioned paper-holding clamp adapted to be disposed across the flat platen; of a holder having an upright bearing, a device carrying one end of the clamp and slidable in said bearing, and a resilient retaining member bearing against the side of said device at the several elevations thereof with sufficient force to maintain the device at each elevation.

11. In a flat-platen type-writing machine, the combination with the flat platen thereof, and a tensioned paper-holding clamp adapted to be disposed across the flat platen; of a holder having upright bearings, a device carrying one end of the clamp and slidable in said bearings, and a resilient retaining device between the bearings bearing against the side of the device at the several elevations thereof with sufficient force to maintain the device at each elevation.

12. In a flat-platen type-writing machine, the combination with the flat platen thereof, and a tensioned paper-holding clamp adapted to be disposed across the flat platen; of a holder having an upright bearing, a device carrying one end of the clamp and slidable in said bearing, and a V-shaped spring having its apex recessed and bearing against said device at the several elevations thereof with sufficient force to maintain the device at each elevation.

13. In a flat-platen type-writer, the combination with the flat platen thereof, and a flexible paper-clamp disposed across the platen; of a horizontal rod at one edge of the platen, and a spring-actuated spool thereon carrying one end of said clamp and maintaining the latter under tension; and of a device adjustable up or down carrying the other end of the clamp, and an upright bearing in which said device slides.

813,490. CEMENT-KILN. THOMAS A. EDISON, Llewellyn Park, N. J. Filed Nov. 2, 1904. Serial No. 231,005.



Claim.—1. In a kiln, the combination with a pair of cylindrical sections having abutting flanges, of a shoe covering said flanges and comprising a bearing-surface and a securing-flange at right angles thereto, substantially as set forth.

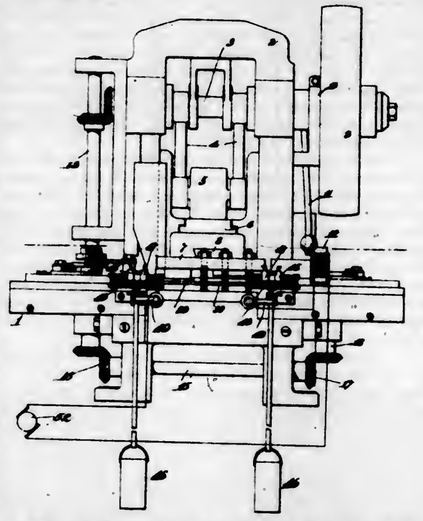
2. In a kiln, the combination with a pair of cylindrical sections having abutting flanges, of a shoe composed of two sets of L-shaped sections placed opposite each other and secured to said flanges, substantially as set forth.

3. In a kiln, the combination with a pair of cylindrical sections having abutting flanges, of a shoe composed of two sets of sections each of which has a bearing-surface and a securing-flange, the sections of one set being so placed that their bearing-surfaces break joints with those of the other set, substantially as set forth.

4. In a kiln, the combination with a pair of cylindrical sections having abutting flanges, of a shoe composed of two sets of L-shaped sections placed opposite each other and breaking joints, substantially as set forth.

5. In a kiln, the combination with a pair of cylindrical sections having abutting flanges, of a bearing comprising two sets of sections secured to said flanges and forming rings, the sections of one ring breaking joints with the sections of the other ring, substantially as set forth.

813,491. POCKET-FILLING MACHINE. THOMAS A. EDISON, Llewellyn Park, N. J., assignor to Edison Storage Battery Company, West Orange, N. J., a Corporation of New Jersey. Filed May 16, 1903. Serial No. 157,630.



Claim.—1. In a machine of the class described, the combination of two movable carriers, arranged so that their paths of movement intersect, means for moving the carriers intermittently, means for introducing pocket-sections in the carriers, means for introducing material into one of the pocket-sections, and means for engaging the pocket-sections together at the point of intersection of the carriers, substantially as and for the purposes set forth.

2. In a machine of the class described, the combination of two rotatable carriers, arranged so that their paths of movement intersect, means for rotating the carriers intermittently, means for introducing pocket-sections in the carriers, means for introducing material into one of the pocket-sections, and means for engaging the pocket-sections together at the point of intersection of the carriers, substantially as set forth.

3. In a machine of the class described, the combination of two movable carriers, arranged so that their paths of movement intersect, means for rotating the carriers intermittently, means for introducing pocket-sections within the carriers, means for introducing material into one of the pocket-sections, means for introducing the pocket-sections together at the point of intersection, and means for applying pressure to the engaged sections to crimp the edges of one upon the other, substantially as set forth.

4. In a machine of the class described, the combination with two movable carriers, arranged so that their paths of movement intersect, means for rotating the carriers intermittently, means for introducing pocket-sections within the carriers, means for introducing material into one of the pocket-sections, means for introducing the pocket-sections together at the point of intersection, means for applying pressure to the engaged sections to crimp the edges of one upon the other and means for ejecting the finished pockets, substantially as and for the purposes set forth.

5. A machine of the class described, comprising in combination two movable carriers, arranged so that their paths of movement intersect, means for moving the carriers intermittently, means for introducing pocket-sections within the carriers, means for introducing material into one of said pocket-sections, means for tamping said material, and means for introducing one pocket-section within the other at the point of intersection of the carriers, substantially as set forth.

6. A machine of the class described, comprising in combination two movable carriers, arranged so that their paths intersect, means for moving the said carriers intermittently, means for introducing

pocket-sections within said carriers, means for introducing material within one of said pocket-sections, means for expanding or flaring the edges of the other pocket-sections, and means for introducing the filled pocket-sections within the expanded or flared pocket-sections at the point of intersection of the carriers, substantially as and for the purposes set forth.

7. A machine of the class described, comprising in combination two movable carriers, arranged so that their paths intersect, means for moving the said carriers intermittently, means for introducing pocket-sections within said carriers, means for introducing material within one of said pocket-sections, means for expanding or flaring the edges of the other pocket-sections, means for introducing the filled pocket-sections within the expanded or flared pocket-sections at the point of intersection of the carriers, and means for applying pressure to the flared sections to crimp their edges upon the filled sections, substantially as set forth.

8. A machine of the class described, comprising in combination two movable carriers, arranged so that their paths intersect, means for moving the said carriers intermittently, means for introducing pocket-sections within said carriers, means for introducing material within one of said pocket-sections, means for expanding or flaring the edges of the other pocket-sections, means for introducing the filled pocket-sections within the expanded or flared pocket-sections at the point of intersection of the carriers, means for applying pressure to the flared sections to crimp their edges upon the filled sections, and means for ejecting the finished pockets, substantially as set forth.

9. A machine of the class described, comprising in combination two rotatable carriers, arranged so that their paths of movement intersect, means for rotating the carriers intermittently, means for introducing pocket-sections within said carriers, means for introducing material in one of said pocket-sections and means for introducing the filled sections into the sections on the other carrier at the point of intersection of said carriers, substantially as set forth.

10. A machine of the class described, comprising in combination two rotatable carriers, arranged so that their paths of movement intersect, means for rotating the carriers intermittently, means for introducing pocket-sections within said carriers, means for introducing material in one of said pocket-sections, means for introducing the filled sections into the sections on the other carrier at the point of intersection of said carriers, and means for crimping the edges of the outer sections upon the inner sections to lock the sections together, substantially as set forth.

11. A machine of the class described, comprising in combination two rotatable carriers, arranged so that their paths of movement intersect, means for rotating the carriers intermittently, means for introducing pocket-sections within the carriers, means for introducing material in one of said sections, means for introducing the filled sections into the sections on the other carrier at the point of intersection of said carriers, means for crimping the edges of the outer sections upon the inner sections to lock the sections together, and means for ejecting the finished pockets, substantially as set forth.

12. In a machine of the class described, the combination with a rotatable carrier, a die for introducing pocket-sections therein, a power-shaft for operating said die, a clutch-lever controlling the application of power to said shaft, a magazine for containing the pocket-sections, a slide for moving the sections in said magazine, and means controlled by said slide to effect the operation of said clutch-lever when the magazine becomes emptied, substantially as set forth.

13. In a machine of the class described, the combination with a rotatable carrier, a die for introducing pocket-sections therein, a power-shaft for operating said die, a clutch-lever controlling the application of power to said shaft, a magazine for containing the pocket-sections, a slide for moving the sections in said magazine, a circuit-breaker actuated by said slide when the magazine becomes emptied and a magnet controlled by the circuit-breaker to effect the operation of the clutch-lever, substantially as and for the purposes set forth.

14. In a machine of the class described, the combination with a power-shaft and a clutch-lever for controlling the application of power to the same, a magazine for containing articles to be operated upon by power from the power-shaft, and an electromagnetic device controlled by the movement of the articles in the magazine for actuating the clutch-lever, substantially as set forth.

15. In a machine of the class described, the combination with a magazine, a slide movable therein, and spring-clips adapted to lock the slide in said magazine, but permitting longitudinal movement of said slide, substantially as set forth.

16. In a machine of the class described, the combination of two dials containing openings for receiving pocket-sections, gearing between said dials, a star-wheel for actuating said gearing, a driving-shaft and a pin on said shaft engaging the star-wheel, substantially as set forth.

17. In a machine of the class described, the combination with a rotatable dial, and means for intermittently moving the same, of a slide for introducing pocket-sections within the dial, an arm for moving said slide, and means for adjusting the position of said arm relative to the slide, substantially as set forth.

18. In a machine of the class described, the combination with a rotatable dial having openings for receiving pocket-sections and means for intermittently moving the same, of a punch-head carrying a series of dies coöperating with the pocket-sections in said dial, and centering-dies carried by the punch-head for engaging the dial to center the same in its position of rest, substantially as set forth.

19. In a machine of the class described, the combination with a fixed bed, a dial mounted thereon and having openings adapted to receive pocket-sections, and means for moving the dial intermittently, of a slide adapted to aline the pocket-sections with one of said openings when the dial is stationary, and a filling-die for engaging the pocket-section and introducing the same within the dial, substantially as set forth.

20. In a machine of the class described, the combination with a fixed bed, a dial mounted thereon and having openings adapted to receive pocket-sections, and means for moving the dial intermittently, of a slide adapted to aline the pocket-sections with one of said openings when the dial is stationary, and a spring-pressed filling-die, for engaging the pocket-sections and introducing the same within the dial, substantially as set forth.

21. In a machine of the class described, the combination with a dial having openings for receiving pocket-sections and means for intermittently rotating the same, of a slide for moving the pocket-sections into alinement with one of said openings, a punch 57 for forcing the pocket-sections into said opening and an upsetting-die 61 with which said punch coöperates to flare the edges of the pocket-sections, substantially as set forth.

22. In a machine of the class described, the combination with a dial having openings for receiving pocket-sections and means for intermittently rotating the same, of a slide for moving the pocket-sections into alinement with one of said openings, a punch 57 for forcing the pocket-sections into said opening, an upsetting-die 61 with which said punch coöperates to flare the edges of the pocket-sections, and means for simultaneously moving said punch and upsetting-die, substantially as set forth.

23. In a machine of the class described, the combination with a dial having openings for receiving pocket-sections and means for intermittently rotating the same, of a slide for moving the pocket-sections into alinement with one of said openings, a punch 57 for forcing the pocket-sections into said opening and an upsetting-die 61 with which said punch coöperates to flare the edges of the pocket-sections, and a spring-pressed section within the upsetting-die for separating the pocket-section from the latter, substantially as set forth.

24. In a machine of the class described, the combination with a dial having openings for receiving pocket-sections and means for intermittently rotating the same, of means for introducing pocket-sections within said dial, means for introducing material within said pocket-sections, and a tamping-die for compressing the material within the pocket-sections during the periods of rest of the dial, substantially as set forth.

25. In a machine of the class described, the combination of two dials, arranged so that their paths intersect and having openings for containing pocket-sections, means for introducing pocket-sections within said dials, means for introducing material within the pocket-sections carried by one dial and a punch 76 for introducing the filled pocket-sections of one dial into the pocket-sections of the other dial at the point of intersection of the two dials, substantially as set forth.

26. In a machine of the class described, the combination of two dials, arranged so that their paths intersect and having openings for containing pocket-sections, means for introducing pocket-sections within said dials, means for introducing material within the pocket-sections carried by one dial, a punch 76 for introducing the filled pocket-sections of one dial into the pocket-sections of the other dial at the point of intersection of the two dials, and a spring-pressed die coöperating with said punch, whereby the pocket-sections will be compressed between the punch and die, substantially as set forth.

27. In a machine of the class described, the combination of two dials, arranged so that their paths intersect and having openings for containing pocket-sections, means for introducing pocket-sections within said dials, means for introducing material within the pocket-sections carried by one dial, a punch 76 for introducing the filled pocket-sections of one dial into the pocket-sections of the other dial at the point of intersection of the two dials, a spring-pressed die coöperating with said punch, whereby the pocket-sections will be compressed between the punch and die and means for simultaneously operating the punch and die, substantially as set forth.

28. In a machine of the class described, the combination with a dial having openings for receiving telescoped pocket-sections, and means for intermittently moving the same, of a crimping-punch arranged to engage the telescoped sections within the dial, a crimping-die against which sections are forced by said punch to crimp the edges of one section upon the other, and a spring-pressed plunger coöperating with the said punch to return the pocket-sections as the punch is withdrawn, substantially as set forth.

813,492. **FISHING-ROD.** JOSEPH B. FRICHER, Chicago, Ill., assignor of one-half to Ernest A. Tesch, Chicago, Ill. Filed May 18, 1905. Serial No. 260,499.

Claim.—1. In a fishing-rod, a plurality of telescopically-mounted metal tubular sections each of uniform cross-diameter throughout its length, means for interlocking said sections consisting of a spring-sleeve arranged at one end of each section and hang the portion between its ends of greater cross-diameter than at its ends and adapted to expand against the inner walls of the outer section.

2. In a fishing-rod, a plurality of telescopically-mounted metal tubular sections, means for interlocking said sections consisting of a tubular spring-sleeve arranged at one end of each section and having slots cut longitudinally therein, the ends of said slots being closed and said sleeve adapted to expand against the inner walls of the outer section.

3. In a fishing-rod, a tubular rod of uniform cross-diameter throughout its length, a handle reversibly mounted on said rod and consisting of a grip portion and a reel-seat portion, said rod extending entirely through said handle, a thimble fixed on said rod, and a thimble removably secured to one end of said rod, said fixed and removable thimbles forming end bearings for said grip and reel-receiving portions respectively.

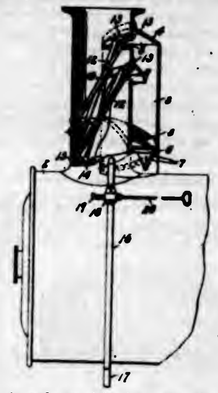
4. In a fishing-rod, a tubular rod of uniform cross-diameter throughout its entire length and a threaded plug inserted in one end of said rod, a hollow handle reversibly mounted on said rod and consisting of a grip portion and a reel-seat portion, said rod extending entirely through said handle, collars slidably mounted on said reel-seat portion, a thimble fixed on said rod and having its edges flared outwardly, a thimble having a threaded engagement with said plug, having its ends outwardly flared, said fixed and removable thimbles forming end bearings and means for protecting the edges of said reel and grip portions respectively.

5. In a fishing-rod, a plurality of telescopically-mounted metal tubular sections, means for interlocking said sections consisting of a spirally-slotted tubular spring-sleeve arranged at one end of each section, and adapted to expand against the inner walls of the outer section.

6. As a means for frictionally interlocking two tubular rods, a sleeve composed of spring metal having a plurality of helical slots formed therein, said slots extending for a portion only of the length of said sleeve, and the slotted portion of said sleeve being of greater cross-diameter than the unslotted portion.

7. A rod composed of a plurality of metal tubes telescopically arranged, each of uniform cross-diameter throughout its entire length, and each provided with a tubular sleeve of spring metal, and with an internal collar adapted to serve as a stop for the tube passing through said collar, said sleeve having longitudinal slots formed therein between its ends, and the slotted portion being of greater cross-diameter than the ends.

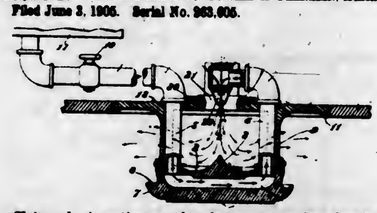
813,493. **SPARK-ARRESTER.** GEORGE FOREMAN and ALBERT R. MORROW, Brashear, Mo. Filed Sept. 14, 1905. Serial No. 278,473.



Claim.—1. A smoke-stack having a plurality of transverse slots disposed in vertical series, a receptacle adjacent to the stack and communicating therewith through the slots, a plurality of grates supported one above another in an inclined position within the stack and having their upper ends secured adjacent to the upper edges of the slots, said grates having intercurrently-disposed bars concave in their under sides, and deflecting means within the receptacle.

2. A smoke-stack, a receptacle adjacent to said smoke-stack and communicating with the latter through transverse slots, and a plurality of inclined grates disposed within the funnel and having their upper ends connected with the latter above the several slots; in combination with an apron or deflector within the receptacle, above one of the slots.

813,494. **VAPOR-BURNER.** EDWARD A. FRANKLIN, Austin, Tex. Filed June 3, 1905. Serial No. 263,605.



Claim.—1. A casting cored to form a generating-chamber and having on its upper side a conical projection with dished walls forming an annular channel surrounding the base of the cone, suspending means for said casting, a feed-pipe entering the generating-chamber, and a discharge-pipe connected with the generating-chamber and extending above and discharging in the direction of the cone.

2. A generator having upon its upper side a cone, and an annular channel surrounding the base of the cone; suspending means for the generator; a supply-pipe threaded into one side of the generator; an exit-pipe threaded into the opposite side of the same and having a laterally-extending terminal cap; and a nozzle or burner-tip the outer end of which forms a wrench-seat and the inner end of which is threaded into said cap and directed toward the apex of the cone.

3. A plate having an aperture, a generator suspended beneath said aperture and having upon its upper side a conical projection and a channel surrounding the base of the cone an annular overflow-gutter formed exteriorly upon the generator, a supply-pipe connected with one side of the generator, an exit-pipe connected with the opposite side of the generator and extending through the supporting-plate, a terminal cap connected with and extending laterally from the exit-pipe, and a nozzle or burner-tip threaded into said cap and directed toward the apex of the cone.

4. A burner-cap, a nozzle extending radially from said cap, a

sleeve encircling the cap and having a slot engaging the nozzle, and a deflecting member connected with said sleeve.

5. A burner-cap, a tip or nozzle radiating therefrom, a sleeve

be hitched, locks for locking and releasing said branch lines, a releasing connection for said locks extending to a distant point, guides for said branch lines located at the rear portion of the vehicle,

with said pinion for imparting motion to the pistons, substantially as specified.

2. The combination, with a bracket-arm having a recess formed in its edge, and lateral projections adjacent said recess, of a clamp

sleeve encircling the cap and having a slot engaging the nozzle, and a deflecting member connected with said sleeve.

5. A burner-cap, a tip or nozzle radiating therefrom, a sleeve encircling the cap and having a slot engaging the tip, and leaves extending in opposite directions from said sleeve and constituting respectively a deflector and a handle.

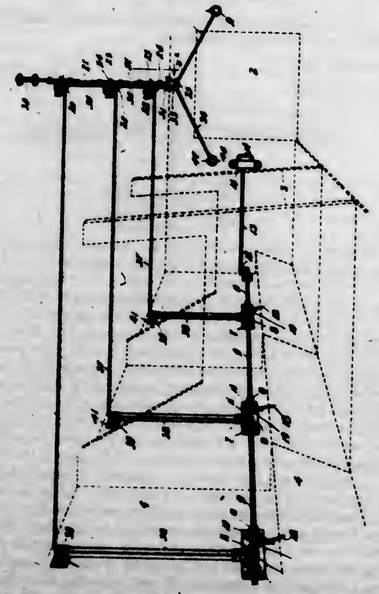
6. A burner-cap, a tip or nozzle radiating therefrom, a strip encircling the cap to form a sleeve and having a slot engaging the tip, and a clamping-bolt connecting the parts of the strip constituting the sleeve; the ends of said strip being bent in opposite directions to constitute respectively a handle and a deflector.

7. The combination with a burner-cap having a radiating tip, of a slotted strip bent upon the cap to form a sleeve and laterally-extending members constituting respectively a handle and a deflector, and connecting means for clamping the sleeve for rotation upon the cap; the slotted portion being in engagement with the tip to limit the extent of rotation of the sleeve.

813,495. METHOD OF SEPARATING BUCKHORN AND PLANTAIN SEED FROM CLOVER AND ALFALFA SEED. SAMUEL P. GLOST, Union City, Ind. Filed Sept. 21, 1905. Serial No. 279,411.

Claim.—The herein-described method of separating buckhorn-seeds and plantain-seeds from clover-seed or alfalfa-seed consisting in mixing with the clover-seed or the alfalfa-seed which contains buckhorn-seed or plantain-seed, dampened sawdust, then spreading the seed on a canvas or tight floor to partially dry, then passing the seed through a screen, then spreading the screened seed out to dry, and finally passing the screened seed through a fanning-mill.

813,496. DEVICE FOR LEADING ANIMALS FROM BURNING BUILDINGS. ELMER E. HIGGINS, St. Paul, Minn. Filed Feb. 20, 1905. Serial No. 246,262.



Claim.—3. In a device of the character described, the combination with a main lead-line having a plurality of branch lines extending into the stalls and provided with devices to which the horses may be hitched, locks for locking and releasing said branch lines, a releasing connection for said locks extending to a distant point, guides for said branch lines located at the rear portions of the stalls, and a connection between said lead-line and said rear guides, for releasing the latter, substantially as described.

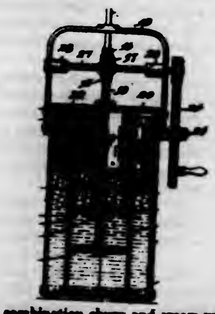
2. In a device of the character described, the combination with a main lead-line having a plurality of branch lines extending into the several stalls and provided with devices to which the horses may be hitched, locks for locking and releasing said branch lines, means for operating said locks from a distant point to release said branch lines, guides for said branch lines in the form of rings, detaining devices normally holding said rings at the rear of the respective stalls, and connections between said main lead-line and the several detaining devices for operating the same to release the several guide-rings, under a movement of said main lead-line, substantially as described.

3. In a device of the character described, the combination with a main lead-line having a plurality of branch lines extending into the several stalls and provided with rings to which the horses may be hitched, locks normally holding said rings, means for operating said locks to release said hitching-rings, hinged sheaths normally holding said branch lines in position, themselves held in operative positions by the respective ring-holding locks and arranged to be released when said locks are actuated to release said hitching-rings, substantially as described.

4. In a device of the character described, the combination with detaining-latches located at the rear of the stalls, and guide-rings normally held thereby, of a main lead-line and branch lead-lines working through said guide-rings, said branch lines having, at their ends, hitching-rings, a rock-shaft having a plurality of hitching-hooks acting as locks, located at the front of the stalls and normally holding said hitching-rings, means for rocking said shaft to release the several hitching-rings, and a connection between said main lead-line and the several detaining-latches for releasing the several guide-rings, under a movement of said lead-line required to lead the horses from the building, substantially as described.

5. In a device of the character described, the combination with a main lead-line having a plurality of branches extending into the several stalls and provided with devices to which the horses may be hitched, of guides for the several branch lines arranged to be released by a movement of said lead-line, substantially as described.

813,497. COMBINATION CHURN AND CREAM-WHIPPER. SAMUEL S. HITCHCOCK, St. Louis, Mo. Filed June 12, 1905. Serial No. 264,869.



Claim.—1. A combination churn and cream-whipper comprising an outer receptacle, a perforated inner receptacle, a flange, a projecting ring formed on the bottom of the outer receptacle for retaining the inner receptacle in position, a flanged cover mounted on the outer receptacle and resting upon the inner receptacle, a yoke carried by the cover and supported to the sides thereof, a shaft supported in bearings carried by the yoke, a cam formed on said shafts, an agitator operating in the inner receptacle and raised and lowered by the cam, and gear-wheels carried by the yoke by which the agitator is operated, substantially as specified.

2. A combination churn and cream-whipper comprising an outer and inner receptacle, a cover having an outer and inner flange mounted over the said receptacles, a yoke carried by the cover and secured to the outer flange, a rod carrying a pair of pistons located within the inner receptacle, a cam-yoke formed on said rod, a shaft carried by the yoke and operating in bearings formed thereon, a cam carried by the shaft and operating in the cam-yoke, a pinion located upon said shaft, and a gear-wheel carried by the yoke and meshing with said pinion for imparting motion to the pistons, substantially as specified.

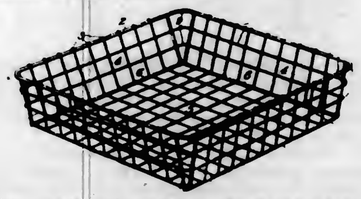
813,498. CAR-FENDER. MARTHA B. JOHN, Portsmouth, Va. Filed June 15, 1905. Serial No. 265,452.

Claim.—1. A safety-fender for cars comprising a body having a suitable base, adapted for attachment to the front of a car and provided with a chamber normally closed by spring-controlled doors arranged at an incline to the base of the fender and a cushioning device movably mounted in said chamber.

2. A safety-fender for cars comprising a body having a suitable base, adapted for attachment to the front of a car and provided with a chamber normally closed by spring-controlled doors arranged at an incline to the base of the fender and a cushioning device mounted in said chamber and movable therein longitudinally of the fender.

3. A safety-fender for cars comprising a body having a suitable base, adapted for attachment to the front of a car and provided with a chamber normally closed by spring-controlled doors arranged at an incline to the base of the fender and a cushioning device mounted in said chamber movable therein longitudinally of the fender and means for guiding said cushioning device during longitudinal movement.

813,499. WIRE BASKET. MOSES B. JOHNSON, Pittsburg, Pa. Filed Apr. 15, 1905. Serial No. 255,771.



Claim.—An integral wire basket made up from a blank substantially in the form of a Maltese cross and composed of crossed fabric wires, the wings of the cross forming the sides of the basket, frame-wires running along the junction of the sides and bottom and crossing each other at the lower corners of the basket, and selvage-wires running along the top edges of the sides, the selvage and fabric wires being connected at the basket-corners by welded butt-joints.

813,500. TROLLING-SPOON. CHARLES KAUSON, Bath, N. Y. Filed Sept. 21, 1905. Serial No. 279,551.

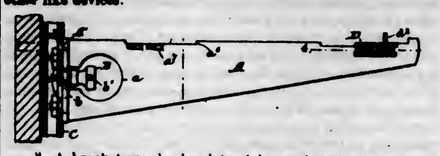
Claim.—1. A trolling-spoon provided with a laterally-extended rib having its end portions projected, the one forming a hook and the other providing an attaching means for connection of the spoon to the line.

2. A trolling-spoon provided with a laterally-extended rib having its end portions projected, the one having an eye and the other a hook.

813,501. BRACKET. HENRY F. KEIL, Brooklyn, N. Y. Filed May 27, 1904. Serial No. 210,144.

Claim.—1. The combination, with a hollow support, having suitable spaced openings in its front wall, of a bracket-arm having shouldered projections on its rear end and an orifice between said projections, a plate of greater width than the thickness of the arm, said plate having openings therein and a screw-threaded hole between the said openings, the projections on the arm passing through the openings in the plate and support and provided with suitable heads, and a set-screw located in said orifice engaging with the screw-threaded hole in the plate and bearing on the support.

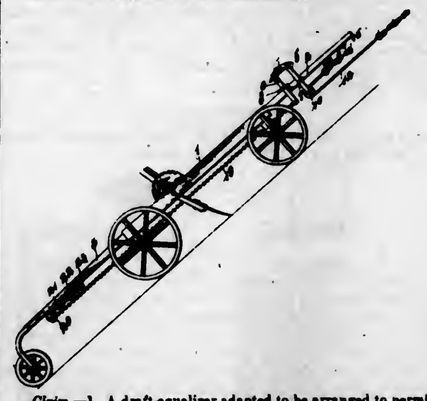
2. The combination, with a bracket-arm having a recess formed in its edge, and lateral projections adjacent said recess, of a clamp or rest adapted to be seated within said recess and movable therein to engage said projections, and having holes to receive screws or other like devices.



3. A bracket-arm having lateral-disposed projections formed below and near the upper edge thereof, in combination with a spring-clamp, the top portion of which lies across and in a plane with the edge of the bracket-arm, and the lower parts or jaws of which cover and inclose the said projections, the said spring-clamp having a lug or lip to serve as a separating device for two adjacent articles supported by the said bracket.

4. A bracket-arm having laterally-disposed projections formed near the edge thereof, in combination with a C-shaped spring clamp or rest, the jaws of which are constructed and arranged to engage the lower part of the said laterally-disposed projections on opposite sides of the bracket-arm, the said clamp being also formed with openings extending through the same, a part with which the said clamp or rest may be engaged, and screws to compress the body and jaws of the said clamp toward each other and thereby fasten the said part, bracket-arm and clamp or rest together.

813,502. DRAFT-EQUALIZER. ABRAHAM KRAHN, Langdon, N. D. Filed Aug. 28, 1905. Serial No. 276,105.



Claim.—1. A draft-equalizer adapted to be arranged to permit draft-teams to be connected to the front and rear of a vehicle or machine, and the draft evenly distributed to all the teams, substantially as described.

2. In a draft-equalizer, the combination with pivotally-mounted equalizing-levers, of a front draft-cable adapted to be slidably engaged with the end of one of said levers, draft devices connected to the ends of said cable, and means whereby draft-teams may be hitched at the rear end of the vehicle or machine and connected with the other equalizing-lever, substantially as described.

3. In a draft-equalizer, the combination with pivotally-mounted equalizing-levers of a front draft-cable adapted to be slidably engaged with the end of one of said levers, draft devices connected to the ends of said cable, draft devices arranged in the rear of said vehicle or machine and a sliding connection between said rear draft devices and the end of the other equalizing-lever, substantially as described.

4. In a draft-equalizer, the combination with a pair of equalizing-levers pivotally mounted on the front tongue or pole of the vehicle or machine, a cross-bar pivotally connecting one end of said levers, a guide-pulley journaled in the opposite end of one of said levers, a draft-cable connected with said pulley, one end of said cable extending beyond the end of said front pole or tongue, draft devices secured to the front and rear ends of said cable, and means connected

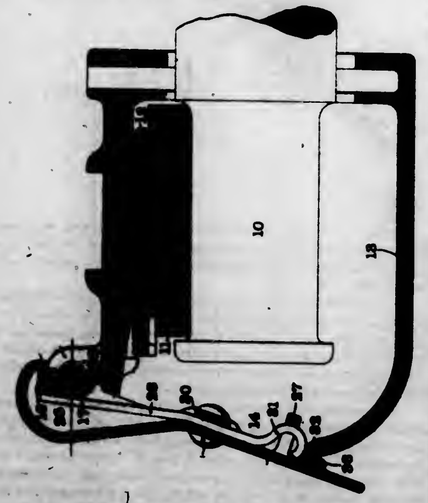
with the free end of the other equalizing-lever whereby draft-teams may be hitched thereto at the rear of said vehicle or machine, substantially as described.

6. In a draft-equalizer, the combination with a pair of equalizing-levers pivotally mounted on the front tongue or pole of the vehicle or machine, a cross-bar pivotally connecting one end of said levers, a guide-pulley journaled in the opposite end of one of said levers, a draft-cable connected with said pulley, one end of said cable extending beyond the end of said front pole or tongue, draft devices secured to the front and rear ends of said cable, a guide-pulley secured to the rear tongue or pole of the vehicle or machine, a draft-cable connected to the free end of the other equalizing-lever, said cable extending rearwardly and over the guide-pulley on said rear tongue and draft devices connected to the free end of said cable whereby draft-teams may be hitched in the rear of said vehicle or machine, substantially as described.

813,503. MATCH-BOX. HENRY H. LEMMON and HUGO J. KALLMEIN, Hartford, Conn. Filed Oct. 5, 1905. Serial No. 281,444.

Claim.—A match-box having a base supporting a receptacle and a cylinder, a gate movable vertically in the receptacle, a plunger movable vertically in the cylinder, a connection between the plunger and the gate, a spring for lifting the gate, a spring for lifting the plunger, means for depressing the plunger, and an air-valve in the cylinder whereby the plunger may be depressed quickly but is caused to rise slowly, substantially as specified.

813,504. JOURNAL-BOX LID. ARTHUR LIPSCHUTZ, St. Louis, Mo. Filed Sept. 20, 1905. Serial No. 279,219.



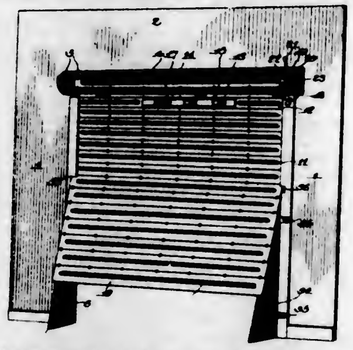
Claim.—1. The combination with a journal-box provided with an opening, of a lid for said opening, a spring carried by said lid and bearing at one end against said box, the other end of said spring engaging with said box to hold said lid in position.

2. The combination with a journal-box provided with an opening, of a lid for said opening, a spring carried by said lid and bearing at one end against said box, the other end of said spring forming a bolt engaging with said box to hold said lid in position, and a stop for said spring adjacent to said lock.

3. The combination with a journal-box provided with an opening, of a lid for said opening, a spring carried by said lid and bearing at one end against said box, means securing said spring to said lid at a point intermediate the ends of said spring, the opposite end of said spring engaging with said box adjacent to said opening to hold said lid in position.

4. The combination with a journal-box, provided with hinge-pin lugs and a flange on said box between said lugs, said flange being provided with a groove on its rear face, of a hinge-pin passing through said lugs and groove, a lid journaled on said hinge-pin and provided with a lip making contact with said flange, and a spring carried by said lid and bearing at one end against said box, the opposite end of said spring engaging with said box to hold said lid in position.

813,505. FIREPLACE AND GRATE BLOWER. WALTER F. LOWRY, McMinnville, Tenn. Filed May 24, 1905. Serial No. 262,083.



Claim.—1. A fireplace-blower consisting of a curtain composed of a plurality of flexibly-connected slats one of said slats being provided with apertures, and an apertured damper connected slidably with said slat and having a perforation in constant registry with the underlying portion of the slat.

2. A fireplace-frame having side members grooved in their inner edges and provided with slots in their front sides communicating with said grooves, a drum supported for rotation upon the frame, a curtain connected with said drum and guidable in the grooves of the side members and through the slots of the latter, and auxiliary guide members supported upon the side members of the frame.

3. A fireplace-frame, a blower-curtain guidable in grooves in the side members of the frame and through slots in the latter, and auxiliary guide members consisting of approximately triangular plates connected with the side members of the frame and terminating in acute angles adjacent to the slots in the latter.

4. A fireplace-frame, a blower-curtain guidable in grooves upon the inner sides of the side members of the frame and through slots in the latter, auxiliary triangular guide members having laterally-extending bearing-brackets, and T-shaped lugs upon said brackets adapted to engage T-shaped slots in the side members of the frame.

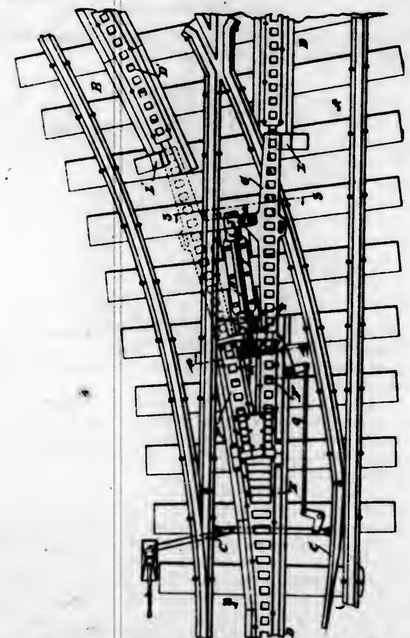
813,506. SWITCH. GEORGE B. LYNCH, Columbus, Ohio, assignor to Joseph A. Jeffrey, Columbus, Ohio. Filed Aug. 30, 1905. Serial No. 276,294.

Claim.—1. In combination with a main track, a branch track and a switch, of a rail system for propulsion purposes arranged adjacent to and parallel with the track-rails and comprising a movable switch member arranged to register either with the main or the branch line of the propulsion-rails, each movable switch member being supported upon a horizontal axis about which it turns in moving from one of its positions to the other, substantially as set forth.

2. In combination with a main track, a branch track and a switch, of rack-rails arranged to follow each track, and a movable rack-rail section adjacent to the switch and arranged to be brought into line with the rack-rail following either track as they diverge, the rack-rail being mounted upon a horizontal pivot that is disposed midway between the lines of rack-rails following the respective tracks, substantially as set forth.

3. In combination with a main track, a branch track and a switch, of a rack-rail following the main track, another rack-rail diverging therefrom and following the branch track, there being

breaks in the said rack-rails adjacent to the switch, and a movable rack-rail section arranged to bridge the break in one or the other of the lines of rack-rails accordingly as it is moved, such movable rack-rail section being pivotally supported and arranged to lie with one of its faces uppermost when in line with one of the rack-rails and with its other face uppermost when in line with the other rack-rail, substantially as set forth.



4. In combination with a main track, a branch track and a switch, of a rack-rail line following the main track, a rack-rail line following the branch track, and a movable rack-rail section arranged to register with either one or the other of the rack-rail lines accordingly as it is thrown, a horizontal shaft, and hinge-sections of unequal length connecting the said shaft with the movable rack-rail member, substantially as set forth.

5. In combination with the main track, a branch track and a switch, of a rack-rail line following the main track, a rack-rail line following the branch track, the said rack-rail lines coming together at the switch, the rack-rails being laid on a higher level than the track-rails, and there being breaks in the permanent rack-rails where they would cross the track-rails, and a pivoted rack-rail section mounted on a horizontal axis and arranged when thrown in one position to overlie a track-rail of the main track and to bridge the break between the permanent sections of the rack-rail of the branch line and when thrown into the other position to overlie a track-rail of the branch line and to bridge the break between the ends of the permanent sections of the rack-rail along the main line, substantially as set forth.

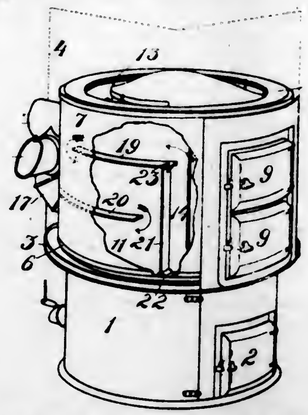
6. In combination with a main track, a branch track, and a switch, of a rack-rail following the main track, another rack-rail following the branch track, each rack-rail being broken or interrupted adjacent to the point where they come together, and a movable rack-rail section mounted upon a horizontal shaft, situated between the main and the branch tracks of the rack-rail and adjacent to the broken or interrupted portions thereof, and means for adjusting the connection of the movable rack-rail section with its shaft, whereby it may be adjusted to suit the angular divergence of the main and branch tracks, substantially as set forth.

7. In combination with a main track, a branch track and a switch, of a rack-rail line following the main track, another rack-rail line following the branch track, a movable rack-rail switch member, G, a shaft, H, horizontally disposed, and hinged pieces, J, J', uniting the movable switch member and the shaft, each hinged piece being of unequal length and one of them being provided with means for adjusting the switch member toward and from the shaft, substantially as set forth.

8. In combination with a main track, a branch track and a switch, of a rack-rail line following the main track, a rack-rail line following the branch track, a movable rack-rail switch member, G, mounted upon a horizontal shaft arranged adjacent to the point where the lines of rack-rails come together and adapted to be thrown into register with one or the other of the lines of the rack-rails, and abutments against which the movable rack-rail member bears when thrown into working positions, substantially as set forth.

9. In combination with a main track, a branch track, a switch and a means for throwing the switch, of a rack-rail following the main track, a rack-rail following the branch track, a movable rack-rail section mounted upon a horizontal shaft adjacent to the point where the two lines of rack-rails come together and arranged to be thrown into a position to register with one or the other of the rack-rails, and connections between the shaft of the movable section of the rack-rail and the mechanism for throwing the switch, substantially as set forth.

813,507. FURNACE-RADIATOR. GEORGE MAAG, Akron, Ohio, assignor to The XXth Century Heating and Ventilating Company, Akron, Ohio, a Corporation of Ohio. Filed May 26, 1905. Serial No. 262,200.



Claim.—A radiator comprising a heating-chamber adapted to be placed in communication with a heater, a second heating-chamber surrounding said first-mentioned heating-chamber and in open communication therewith, said chambers being formed by top and bottom members, each of said members being provided with an elongated aperture adapted to register each with the other, an external casing connecting said top and bottom members, a second casing connecting said top and bottom members, located adjacent to said elongated apertures and forming in connection therewith an air-heating flue through said radiator, said bottom member being provided with a second aperture to adapt the first-mentioned heating-chamber to be placed in communication with a heater, the second heating-chamber being provided with two outlets therefrom, a plurality of baffle-plates arranged in said second heating-chamber in planes parallel with said top and bottom members, one of said baffle-plates being elongated and spaced from the bottom member to form flues in communication with one of said outlets, the others of said baffle-plates being located between the top member and said elongated baffle-plate and extended over the respective ends thereof to form flues and removable baffle-plates connecting said last-mentioned baffle-plates with said bottom member.

813,508. MINING-MACHINE. EDWIN R. MENGEL, Columbus, Ohio, assignor to Joseph A. Jeffrey, Columbus, Ohio. Filed Aug. 22, 1903. Serial No. 170,009.

Claim.—1. In a mining-machine, the combination with the bed-frame, the carriage adapted to move forward and back thereon, and the cutting apparatus on the carriage, of the two rotary engines arranged side by side within the longitudinal planes of the bed-frame, and having the axes of their engine-shafts in a vertical plane trans-

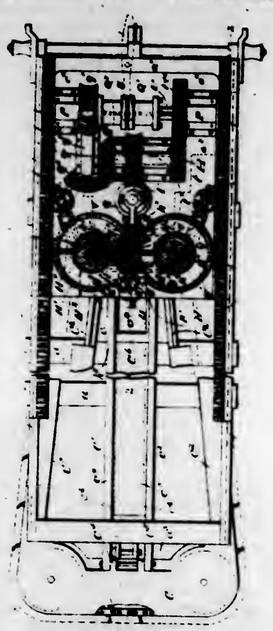
verse to the said bed-frame, the vertical shaft *l*, the gearing between said shaft and each of said engine-shafts, the sprocket-wheel on said vertical shaft engaging with and driving the cutter-chain, and a train

axes of their rotary-engine shafts parallel with each other, a counter-shaft common to both of said engines, gearing similarly connecting each of said rotary-engine shafts to said counter-shaft, power-trans-

means for then moving said carriage to carry said blanks along said

guiding said pivoted bar during the travel of said carriage to control

verse to the said bed-frame, the vertical shaft *l*, the gearing between said shaft and each of said engine-shafts, the sprocket-wheel on said vertical shaft engaging with and driving the cutter-chain, and a train of power-transmitting devices interposed between said vertical shaft and the carriage-advancing mechanism on the bed-frame.



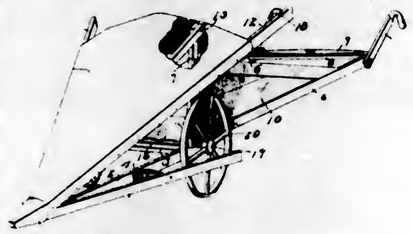
2. In a mining-machine, the combination with the bed, the carriage adapted to move relatively thereto and the cutter-chain on the carriage, of the sprocket-wheel engaging with and driving the said chain, the vertical shaft *l* to which the sprocket is secured, the worm on said shaft for transmitting power to the carriage-advancing mechanism, the gear-wheel on said shaft, and the two vertical engine-shafts having their axes of rotation in a plane transverse to the carriage-frame and in front of the said driving sprocket-wheel, the casings of said motors being arranged within the longitudinal planes of the sides of said bed-frame, the rotary pistons connected with and rotating said shafts and driving-pinions on said shafts engaging with and driving said gear-wheel *l* on the sprocket-shaft, substantially as set forth.

3. In a mining-machine, the combination of the bed-frame, a carriage-frame adapted to move forward and back thereon, an endless cutter-chain on the carriage-frame, two rotary elastic-fluid engines arranged side by side on the carriage-frame and having the axes of their rotary-engine shafts in a vertical plane transverse to the said carriage-frame, and power-transmitting mechanism interposed between said rotary-engine shafts and both the cutter-chain and the bed-frame and adapted both to actuate the said cutter-chain and to cause the carriage to move forward and back along the said bed-frame.

4. In a mining-machine, the combination with the bed-frame, the carriage-frame adapted to move forward and back thereon, and the endless cutter-carrier on the carriage-frame, of two rotary elastic-fluid engines arranged side by side on the carriage-frame and having the axes of their rotary-engine shafts in a vertical plane transverse to the said carriage-frame, a vertical counter-shaft common to both of said engine-shafts, gearing similarly connecting each of said rotary-engine shafts to said counter-shaft, power-transmitting mechanism interposed between said counter-shaft and said cutter-carrier, and power-transmitting mechanism interposed between said counter-shaft and said bed-frame adapted to cause the carriage to move forward and back along the said bed-frame.

5. In a mining-machine, the combination with a bed-frame, a carriage-frame arranged to move forward and back thereon and an endless cutter-carrier on the carriage-frame, of two rotary elastic-fluid engines arranged side by side on the carriage-frame and having the axes of their rotary-engine shafts parallel with each other, a counter-shaft common to both of said engines, gearing similarly connecting each of said rotary-engine shafts to said counter-shaft, power-transmitting mechanism interposed between said counter-shaft and said cutter-carrier, and power-transmitting mechanism interposed between said counter-shaft and said bed-frame and adapted to cause the said carriage to move forward and back along said bed-frame.

818,509. **CORN-LIFTING DEVICE.** JAMES M. MILLER, Rushville, Ind. Filed Oct. 4, 1905. Serial No. 281,340.



Claim.—1. A device for lifting down corn consisting of a frame including a plurality of bars meeting at a common point, a hood covering the upper portion of said frame, and a wheel-supported push-frame connected therewith.

2. A device for lifting down corn including a base-plate composed of forwardly-converging members meeting at a common point, a top frame composed of forwardly-converging members extended to the meeting-point of the members of the base-frame, and a hood covering the members of the top frame.

3. A device for lifting down corn including a wedge-shaped base-frame and an inclined wedge-shaped top frame the side members of which meet at the forward extremity of the base-frame; the rear ends of the side members of the top frame being spaced apart wider than the rear extremity of the base-frame.

4. A corn-lifting device comprising a push-frame including wheel-supported side members, and a forwardly-tapering and downwardly-inclined hood-covered lifting-frame.

5. A corn-lifting device including a hood-covered lifting-frame, and a wheel-supported push-frame connected therewith.

6. A corn-lifting device including a lifting-frame, a push-frame connected therewith, handles connected with the push-frame, and supporting-wheels.

7. A corn-lifting device including a lifting-frame, a wheel-supported push-frame connected therewith and having side members, a cross-bar connecting the side members of the push-frame, draft means connected with the cross-bar, and handles connected with the side members of the push-frame.

8. A corn-lifting device including a forwardly-pointed lifting-frame, a supporting-wheel under the forward extremity of said frame, a wheel-supported push-frame connected with the lifting-frame, and handles connected with the push-frame for manipulating the device.

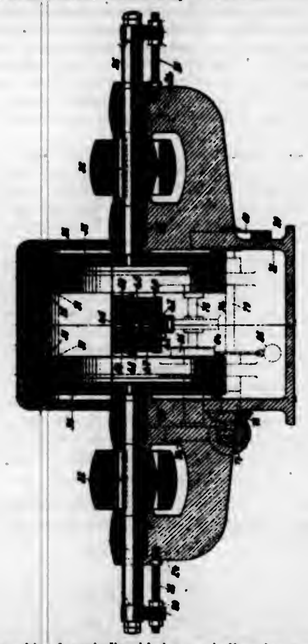
818,510. **MACHINE FOR GRINDING CUTLERY-BLADES AND THE LIKE.** THOMAS R. MOORE, Walden, N. Y. Filed July 31, 1905. Serial No. 271,886.

Claim.—1. In a machine for grinding blades, a grinding-ring, a carriage for holding the blade-blank, means for holding said blank against said ring until the latter has cut into the blank to sufficient depth, and means for then moving said carriage to carry said blank along said ring, whereby the edge and face of the latter are enabled to complete the grinding operation; substantially as set forth.

2. In a machine for grinding blades, a grinding-ring, a carriage for holding the blade-blank, means for holding said blank against said ring until the latter has cut into the blank to sufficient depth, means for then moving said carriage to carry said blank along and against said ring to complete the grinding operation, and means for setting said blank during the movement of said carriage to control the taper or finish to be imparted to the blade; substantially as set forth.

3. In a machine for grinding blades, a pair of facing grinding-rings, a carriage for holding two blade-blanks and adapted to be moved between said rings, means for holding said blanks against said rings until the latter have cut into the blank to sufficient depth,

means for then moving said carriage to carry said blanks along said ring to complete the grinding, and means for setting said blanks during the movement of said carriage to control the taper or finish to be imparted to the blades; substantially as set forth.



4. In a machine for grinding blades, a grinding-ring, a carriage having a holder for the blade-blank, means for yieldingly pressing said holder to hold the blank against said ring until the latter has cut into the blank to sufficient depth, and means for then moving said carriage and holder to carry said blank along said ring to complete the grinding; substantially as set forth.

5. In a machine for grinding blades, a grinding-ring, a carriage having a holder for the blade-blank, means for yieldingly pressing said holder to hold the blank against said ring until the latter has cut into the blank to sufficient depth, means for then moving said carriage and holder to carry said blank along said ring to complete the grinding, and means for setting said blank during the movement of said carriage to control the taper or finish to be imparted to the blade; substantially as set forth.

6. In a machine for grinding blades, a pair of grinding-rings, a carriage having holders for two blade-blanks, means for yieldingly pressing said holders to hold the blanks against said rings until the latter have cut into the blanks to sufficient depth, means for then moving said carriage and holders to carry said blanks along said rings to complete the grinding, and means for guiding said holders during the movement of said carriage to control the taper or finish to be imparted to the blades; substantially as set forth.

7. In a machine for grinding blades, a grinding-ring, a carriage having a pivoted bar thereon on the outer side of which is a holder for a blade-blank, a pressure-bar on the inner side of said pivoted bar, and a spring intermediate said bars, combined with means for pressing against said pressure-bar with a gradually-increasing pressure for a definite period to thereby force the blade-blank against said ring, and means for then moving said carriage, with said blank still against said ring, to carry the blank along the ring to complete the grinding; substantially as set forth.

8. In a machine for grinding blades, a grinding-ring, a carriage having a pivoted bar thereon on the outer side of which is a holder for a blade-blank, a pressure-bar on the inner side of said pivoted bar, and a spring intermediate said bars, combined with means for pressing against said pressure-bar with a gradually-increasing pressure for a definite period to thereby force the blade-blank against said ring, means for then moving said carriage, with said blank still against said ring, to carry the blank along the ring, and means for guiding said pivoted bar during the travel of said carriage to control the taper or finish to be imparted to the blade; substantially as set forth.

9. In a machine for grinding blades, a pair of grinding-rings, a carriage having holders for two blade-blanks, one of said holders having a flat face and the other a face conforming to the ground side of a blank, means for holding said blanks against said rings until the latter have cut into the blanks to a sufficient depth, and means for then moving said carriage to carry said blanks along said rings to complete the grinding; substantially as set forth.

10. In a machine for grinding blades, a pair of grinding-rings, a carriage having holders for two blade-blanks, one of said holders having a flat face and the other a face conforming to the ground side of a blank, means for holding said blanks against said rings until the latter have cut into the blanks to a sufficient depth, means for then moving said carriage to carry said blanks along said rings to complete the grinding, and means for guiding said holders during the movement of the carriage to control the taper or finish to be imparted to the blades; substantially as set forth.

11. In a machine for grinding blades, a pair of grinding-rings, a bar stationary between said rings, a carriage-bar mounted on said stationary bar, a pin and latch for locking said bars together at the initial position of said carriage-bar, and a pair of blade-blank-holding bars carried by said carriage-bar, combined with a sliding bar adapted to move between said holding-bars and during the first part of its movement press the blanks against said rings and then on its continued movement to free said latch and push said carriage-bar to carry said blanks along against said rings, and means for actuating said sliding bar; substantially as set forth.

12. In a machine for grinding blades, a pair of grinding-rings, a bar stationary between said rings, a carriage-bar mounted on said stationary bar, a pin and latch for locking said bars together at the initial position of said carriage-bar, and a pair of blade-blank-holding bars carried by said carriage-bar, combined with a sliding bar adapted to move between said holding-bars and during the first part of its movement press the blanks against said rings and then on its continued movement to free said latch and push said carriage-bar to carry said blanks along against said rings, means for effecting the forward travel of said sliding bar, and means for automatically returning said sliding bar to its initial position, leaving the carriage-bar in its forward position; substantially as set forth.

13. In a machine for grinding blades, a pair of grinding-rings, a bar stationary between said rings, a carriage-bar mounted on said stationary bar, a pin and latch for locking said bars together at the initial position of said carriage-bar, and a pair of pivoted bars mounted on said carriage-bar and having blade-blank holders on their outer sides and spring pressure-bars on their inner or facing sides, combined with a sliding bar guided in said stationary bar and having a pin extended upwardly through a slot in said carriage-bar and between said pivoted bars, and means for actuating said sliding bar, said sliding bar with its pin being adapted during the first part of its movement to engage said pressure-bars and press the blanks against said rings and then on its continued movement to free said latch and push said carriage-bar to carry said blanks along against said rings; substantially as set forth.

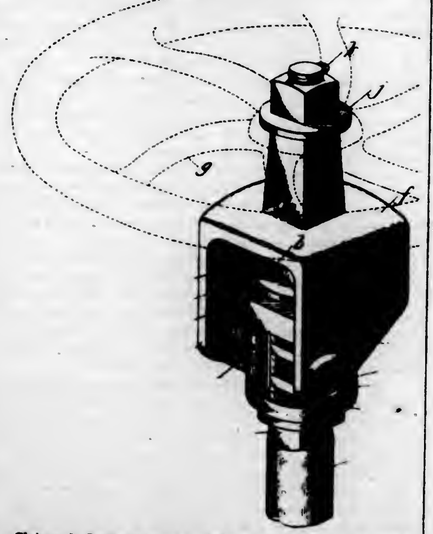
14. In a machine for grinding blades, a pair of grinding-rings, a bar stationary between said rings, a carriage-bar mounted on said stationary bar, a pin and latch for locking said bars together at the initial position of said carriage-bar, and a pair of pivoted bars mounted on said carriage-bar and having blade-blank holders on their outer sides and spring pressure-bars on their inner or facing sides, combined with a sliding bar guided in said stationary bar and having a pin extended upwardly through a slot in said carriage-bar and between said pivoted bars, means for effecting the forward travel of said sliding bar, and means for automatically returning said sliding bar from its forward to its initial position, leaving said carriage-bar in its forward position, said sliding bar with its pin being adapted during the first part of its movement to engage said pressure-bars and press the blanks against said rings and then on its continued movement to free said latch and push said carriage-bar to carry said blanks, along against said rings; substantially as set forth.

15. In a machine for grinding blades, a pair of grinding-rings, a carriage having a pair of pivoted bars thereon on the outer sides of which are holders for the blade-blanks, means for yieldingly pressing said pivoted bars outwardly during a stationary condition of said carriage for a definite period for enabling said rings to act against the blanks, means for then moving said carriage and bars to carry the blanks along against said rings, and adjustable formers for control-

ling the relation of the blanks to the said rings during the travel of said carriage; substantially as set forth.

16. In a machine for grinding blades, a pair of grinding-rings, a carriage having a pair of pivoted bars thereon on the outer sides of, which are holders for the blade-blanks, means for yieldingly pressing said pivoted bars outwardly during a stationary condition of said carriage for a definite period for enabling said rings to act against the blanks, means for then moving said carriage and bars to carry the blanks along against said rings, and adjustable formers for controlling the relation of the blanks to the said rings during the travel of said carriage, said formers comprising pivoted plates against which said pivoted bars are moved and adjusting-screws to set said plates and being mounted on a stationary part of the machine; substantially as set forth.

818,511. **BRAKE-OPERATING MECHANISM FOR CARS.** JOHN O. NEKERK, Chicago, Ill. Filed Aug. 5, 1905. Serial No. 272,967.



Claim.—1. In an apparatus of the class described, the combination of a brake-shaft adapted to be operatively connected with the brake mechanism of a car, a shouldered sleeve mounted upon the shaft in non-rotatable relation thereto, and shaft-operating mechanism mounted in rotatable relation to the shaft movable into and out of engagement with the shouldered sleeve and adapted to be held in non-rotatable relation to the shaft thereby.

2. In an apparatus of the class described, the combination of a brake-shaft adapted to be operatively connected with the brake mechanism of a car, a brake-shaft-operating wheel, a bracket mounted in fixed relation to such operating-wheel, a shouldered sleeve member operating shoulder mechanism upon the shaft in non-rotatable relation thereto, rotatable supporting-sleeve mechanism encircling the shouldered sleeve member and pivotally connected with such bracket adapted to permit the bracket to be moved into and out of operative engagement with the shouldered sleeve member and permit the rotation of the bracket with relation to the shaft when in lowered position.

3. In an apparatus of the class described, the combination of a brake-shaft provided with a squared end portion, a lower supporting-sleeve and an upper shouldered sleeve mounted in non-rotatable relation to such shaft, a supporting-sleeve rotatably mounted between the shouldered portion of the upper shouldered sleeve and the lower sleeve, bracket mechanism pivotally connected with such rotatable sleeve, and an operating-wheel mounted upon and movable with such bracket mechanism.

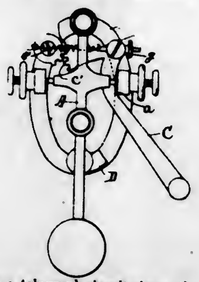
4. In an apparatus of the class described, the combination of a brake-shaft provided with a squared end portion, a sleeve provided with a lower annular portion and an upper squared or shouldered portion mounted in non-rotatable relation to the squared portion of such shaft, a sleeve rotatably mounted upon the annular portion of such shouldered sleeve, a bracket pivotally connected with such rotatable sleeve, and an operating-wheel mounted upon and movable with such bracket into and out of operative position.

5. In an apparatus of the class described, the combination of a brake-shaft provided with shoulder mechanism thereon, a supporting-sleeve rotatably mounted upon such shaft adjacent to the shoulder mechanism, a bracket pivotally connected with such rotatable sleeve and provided with side portions movable into and out of engagement with the shoulder mechanism of the shaft, and a brake-shaft-operating member mounted upon such pivoted bracket and movable therewith.

6. In an apparatus of the class described, the combination of a brake-shaft, a split sleeve rotatably mounted and provided with integral trunnions, a bracket provided with perforations for receiving such trunnions and pivotally mounted upon such split-sleeve member, operating-shoulder mechanism in fixed relation to the brake-shaft, and an operating-wheel mounted upon and movable with the bracket, such bracket being adapted to engage the operating-shoulder mechanism of the shaft when in raised position and being rotatable with relation to the shaft when in lowered position.

7. In an apparatus of the class described, the combination of a brake-shaft provided with a squared end portion and an annular supporting-shoulder portion, a shouldered operating-sleeve mounted upon and in fixed relation to such shaft and having an outer annular bearing portion, a supporting-sleeve rotatably mounted upon the annular bearing portion of such shouldered operating-sleeve, a bracket pivotally connected with the rotatable sleeve and movable into and out of engagement with the shouldered operating-sleeve, and a brake-wheel mounted upon and movable with such bracket.

818,512. **CIRCUIT-CLOSER FOR TELEGRAPH-KEYS.** HERBERT R. NEVENS, Portland, Me. Filed June 14, 1905. Serial No. 265,280.



Claim.—1. In a telegraph circuit-closer, the combination of a circuit-closing lever and a spring arranged to hold said lever in its extreme open position and to close it when moved from said open position.

2. In a telegraph circuit-closer the combination of a circuit-closing lever and a spiral spring for closing said lever fixed at one end and secured to said lever at the other end, said spring located in line with the pivotal center of said lever when the same is in its extreme open position.

3. In a telegraph circuit-closer, the combination of a circuit-closing lever, a stop for limiting its opening movement and a spring arranged to hold said lever against said stop and to close it when moved from said stop.

4. In a telegraph circuit-closer, the combination of a compound circuit-closing lever composed of a larger circuit-closing lever proper and a small auxiliary lever and a spiral spring for closing said lever fixed at one end and having the other end secured to said auxiliary lever said spring located in line with the pivotal center of said small lever when the lever is in its extreme open position.

5. In a telegraph circuit-closer the combination of a circuit-closing lever proper having a segment thereon, a pinion engaging said segment and a spiral spring for closing the lever fixed at one end and having the other end secured to said pinion said spring located in line with the pivotal center of said pinion when the lever is in its extreme open position.

818,518. **SINGLE-TRIGGER MECHANISM FOR GUNS.** GARRET B. CUTHBERT, New York, N. Y. Filed Apr. 27, 1903. Serial No. 154,288.

Claim.—1. In a gun a safety device which consists of a shoulder or projection on the frame of the gun and a longitudinally-movable tripping member engaging with the sear, which is adapted to be interposed between said shoulder or projection and the end of the sear so that the sear cannot be released and means for moving said tripping member out of engagement with said shoulder or projection so that the mechanism can be fired, substantially as and for the purposes described.

2. In a gun a safety device which consists of a shoulder or projection on the frame of the gun, a sear and a longitudinally-movable tripping member and means for interposing said tripping member between such shoulder or projection and the end of the sear and means for moving said tripping member out of engagement with said shoulder or projection so that the mechanism can be fired, substantially as and for the purposes described.

3. In a safety device for double-barreled guns, the combination with a shoulder on the frame of the gun of a sear a movable tripping member engaging with the sear and automatic means for moving said tripping member into engagement with said shoulder when the firing mechanism is cocked and automatic means for moving such tripping member out of engagement with said shoulder when the other sear has been tripped, substantially as and for the purposes described.

4. In a safety device for double-barreled guns, the combination with separate firing mechanisms for each barrel, including in each mechanism a hammer, a sear and a tripping member in engagement with the sear of a shoulder on the frame of the gun, one of said tripping members being adapted to be moved into engagement with said shoulder and lock said sear so that it cannot be tripped, automatic means for moving said tripping member into engagement with said shoulder when the firing mechanism is cocked and automatic means for moving said tripping member out of engagement with said shoulder when the second sear is tripped, substantially as and for the purposes set forth.

5. In a single trigger, the combination with a plurality of firing mechanisms in which are included hammers and sears, of a single trigger, two tripping members engaging respectively with said sears and a swinging member pivoted to the frame of the gun, one of said tripping members being pivoted at its forward end to the frame of the gun and the second tripping member being pivoted at its rear end to said swinging member and means whereby the movement of the first tripping member is communicated to the swinging member and the second tripping member, and the second tripping member is shifted into engagement with the single trigger, substantially as and for the purposes described.

6. In a single trigger, the combination with a plurality of firing mechanisms in which are included hammers and sears, of a single trigger, a tripping member adapted to engage with one of said sears and pivoted at its forward end to the frame of the gun, a second tripping member engaging with the second sear and pivoted at its rear end with a swinging member pivoted to the frame of the gun and means whereby the first tripping member is depressed when the sear with which it is in engagement is tripped and the second tripping member is shifted backward into engagement with the trigger mechanism, substantially as and for the purposes described.

7. In a single trigger, the combination with a plurality of firing mechanisms in which are included hammers and sears, of a single trigger, two tripping members engaging respectively with said sears and intermediate mechanism engaging with both of said tripping members and means whereby one of the tripping members is forced downward when the sear with which it is engaged is tripped and the second tripping member is forced backward and into engagement with the trigger mechanism, substantially as and for the purposes described.

8. In a single-trigger mechanism, the combination with a plurality of firing mechanisms in which are included hammers and sears, of a single trigger, two tripping members engaging respectively with said sears and intermediate mechanism engaging with both of said tripping members and means whereby one of the tripping members is forced downward when the sear with which it is engaged is tripped and the second tripping member is forced backward and into engagement with the trigger mechanism, substantially as and for the purposes described.

9. In a single-trigger mechanism, the combination with a plurality of firing mechanisms, in which are included hammers and sears, of a single trigger, tripping members engaging respectively with said sears, one of which is pivoted at its forward end to the frame of the gun and the other at its rear end to a swinging member supported on the frame of the gun, means whereby one of the tripping members is forced downward when the sear with which it is in engagement is tripped and means whereby the second tripping member is forced backward and into engagement with the trigger mechanism when the first tripping member is forced downward, substantially as and for the purposes described.

10. In a single-trigger mechanism, the combination of a plurality of firing mechanisms, in which are included hammers and sears, of a single trigger, a tripping member adapted to engage with one of said sears and pivoted at its forward end to the frame of the gun, a second tripping member engaging with the second sear and pivoted at its rear end to a swinging angular plate pivotally mounted on the frame of the gun, means for depressing the first sear and tripping member when the first sear is tripped, and intermediate mechanism whereby the second tripping member is shifted backward and into engagement with the trigger mechanism by the downward movement of the first sear and its tripping mechanism when the first sear is tripped, substantially as and for the purposes described.

11. In a single-trigger mechanism, the combination with a sear of a tripping member engaging therewith, a second sear and a second tripping member engaging with said second sear and a member pivoted to the frame of the gun and engaging with both of said tripping members and adapted to transmit motion from the first tripping member to the second tripping member, substantially as and for the purposes described.

12. In a single-trigger mechanism, the combination with a plurality of firing mechanisms, in which are included hammers and sears, of two tripping members engaging respectively with said sears, a swinging member pivoted to the frame of the gun, one of such tripping members being pivoted at its forward end to the frame of the gun and a second tripping member being pivoted at its rear end to said swinging member and the first tripping member being also mechanically connected to said swinging member, substantially as and for the purposes set forth.

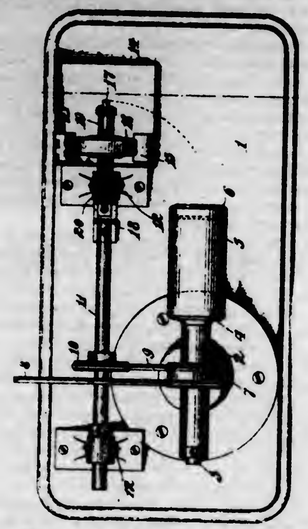
13. In a single-trigger mechanism, the combination with a plurality of firing mechanisms, in which are included hammers and sears, of two tripping members respectively engaging with said sears, a swinging member pivoted to the frame of the gun, one of said tripping members being pivoted at its forward end to the frame of the gun and the hammer of the firing mechanism with which said tripping member cooperates being so cut away that the rear of the sear is forced downward when the mechanism is fired and the second tripping member being pivoted at its rear end to said swinging member and the first tripping member being also in mechanical connection with said swinging member so that any movement of the first tripping member will impart movement to the swinging member and through it to the second tripping member, substantially as and for the purposes described.

14. In a single-trigger mechanism, the combination with a plurality of firing mechanisms in which are included hammers and sears, one of said hammers being cam-shaped so that when the hammer has fallen the rear end of the sear will be depressed, of a tripping member engaging with such sear and pivoted at its forward end to the frame of the gun, a second tripping member engaging with the second sear and pivoted at its rear end to a swinging member pivotally supported on the frame of the gun and a single trigger constituting means whereby the second tripping member is forced out of engagement with the single trigger when the firing mechanisms of both barrels are cocked and moved into engagement with the single trigger by the tripping of the first sear, substantially as and for the purposes described.

818,514. **APPARATUS FOR APPLYING PIGMENT TO ENGRAVED ENDS OF PHONOGRAPH-RECORDS.** JOHN F. OTT, Orange, N. J., assignor to New Jersey Patent Company, Orange, N. J., a Corporation of New Jersey. Filed Sept. 23, 1904. Serial No. 225,324.

Claim.—1. In a machine for applying pigment to phonograph or other sound records, the combination with means for carrying and rotating a cylindrical record, of a pigment-applying roller normally out of engagement with the record but adapted to be engaged with

the end of the same and means for applying pigment to said roller, substantially as set forth.



2. In a machine for applying pigment to phonograph or other sound records, the combination with a mandrel on which the record is held frictionally, of a pigment-applying roller normally held out of engagement with the record but movable into engagement with the end thereof and means for applying pigment to said roller, substantially as set forth.

3. In a machine for applying pigment to phonograph or other sound records, the combination with a mandrel carrying a phonograph-record, of a pigment-applying roller normally out of engagement with said record, but movable into engagement therewith, means for applying pigment to said roller and a wiper engaging the roller during the application of the pigment to the same, substantially as set forth.

4. In a machine for applying pigment to phonograph or other sound records, the combination of a mandrel carrying a phonograph-record, a pigment-supply roller, a pigment-tank in which said supply-roller dips, and a pigment-applying roller normally in contact with the supply-roller, but movable into engagement with the end of the record, substantially as set forth.

5. In a machine for applying pigment to phonograph or other sound records, the combination of a mandrel carrying a phonograph-record, a pigment-supply roller, a pigment-tank in which said supply-roller dips, a pigment-applying roller normally in contact with the supply-roller but movable into engagement with the record, and a wiper with which the applying-roller is normally engaged by the rotation of the supply-roller, substantially as set forth.

6. In a machine for applying pigment to phonograph or other sound records, the combination of a mandrel carrying a phonograph-record, a pivoted arm, a pigment-applying roller longitudinally adjustable on said arm and normally out of engagement with the record, but adapted to be engaged with the same, and means for applying pigment to said roller, substantially as set forth.

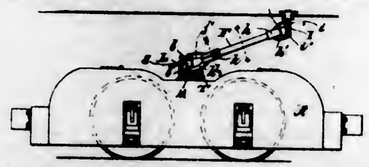
7. In a machine for applying pigment to phonograph or other sound records, the combination of a mandrel carrying a phonograph-record, a pivoted arm, a pigment-applying roller longitudinally adjustable on said arm and normally out of adjustment with the record, a pigment-tank, and a supply-roller for furnishing pigment to said applying-roller, substantially as set forth.

8. In a machine for applying pigment to cylindrical sound-records, the combination of a rotary record-support, a pivoted arm, a pigment-applying roller slidable on said arm, and a spring for restoring said roller to its normal position on said arm, substantially as set forth.

9. In a machine for applying pigment to cylindrical sound-records, the combination of a rotary record-support, and a support carrying a pigment-applying roller, said supports being capable of relative movement to bring the roller into and out of engagement with the end of the sound-record, substantially as set forth.

10. In a machine for applying pigment to cylindrical sound-records, the combination of a rotary record-support, a support carrying a pigment-applying roller, said supports being capable of relative movement to bring the roller into and out of engagement with the end of the sound-record, and means for adjusting said roller in the direction of its axis, substantially as set forth.

813,515. TROLLEY-SUPPORTING DEVICE. ALEXANDER PALMER, Columbus, Ohio, assignor to Joseph A. Jeffrey, Columbus, Ohio. Filed Dec. 2, 1897. Renewed Apr. 11, 1900. Serial No. 12,451.



Claim.—1. The combination with a car of a current-collecting trolley adapted to bear horizontally or laterally against a conductor, a carrier for the trolley adapted to swing around a vertical axis, and to be reversed from a forward position to a rearward position, a tension-spring, permanently connected to said carrier and arranged substantially as set forth to exert uniform tension on the carrier, whether the carrier is in its forward position or in its rearward position, substantially as set forth.

2. The combination with a car, and a current-collecting trolley adapted to bear horizontally or laterally against a conductor, of a carrier for the trolley adapted to swing around a vertical axis to reverse the trolley from a forward position to a rearward position, a tension-spring having one end stationarily fixed in position and its other end adapted to apply power to and vibrate with said carrier about its axis whereby the trolley will be held with a uniform pressure against the conductor whether it is in its forward position or in its rearward position, substantially as set forth.

3. The combination with an electric car or locomotive, and a current collecting and transmitting device having a trolley adapted to bear laterally against a conductor, a carrier for said trolley arranged to vibrate horizontally and to reverse the trolley from a forward position to a rearward position, a tubular holder for said carrier supported by the car, a tension-spring connected with said carrier to hold the trolley against the conductor whether it is in its forward position or in its rearward position, and an arm movable with the carrier and adapted to limit the movement thereof in either direction, substantially as set forth.

4. The combination with a car and a current-collecting trolley adapted to bear laterally against a conductor, of a carrier for said trolley adapted to vibrate about a vertical axis to reverse the trolley from a forward position to a rearward position, a spring having its ends permanently connected, respectively, to a stationary post or lug and to an arm adapted to vibrate with the carrier, whereby said spring will hold the trolley against the conductor whether the trolley is in its forward position or in its rearward position, and means independent of the spring and conductor, for positively limiting the lateral movement of the trolley under the pull exerted by the spring, substantially as set forth.

5. The combination of a car, a trolley adapted to bear laterally against a conductor, a support for the trolley adapted to be rotated about a vertical axis to reverse the trolley from a forward position to a rearward position, and a spring arranged below the top of the car and connected with said rotary support for holding the trolley with a uniform tension against the conductor whether said trolley is in its forward position or in its rearward position, substantially as set forth.

6. The combination of a car, a carrier mounted on the car to vibrate about a vertical axis and having a short upwardly-extending standard, a trolley adapted to bear laterally against a conductor, a pole for said trolley consisting of two closely-adjacent parallel members, pivotally connected to said standard and trolley, whereby the latter will be held constantly in a horizontal position, and a spring for holding the trolley in proper vertical position, substantially as set forth.

7. The combination of a car, a trolley adapted to bear laterally against a conductor, a carrier for the trolley adapted to rotate about a vertical axis, and having a short upwardly-extending stem or standard, a pole interposed between said standard and trolley and consisting of two closely-adjacent parallel members each independently pivoted to said standard and to the trolley, a spring connected with one of said members of the trolley-pole for adjusting the trolley vertically, and a spring connected with the rotatable carrier to hold the trolley laterally against the conductor, substantially as set forth.

8. The combination with a car, and a trolley adapted to bear laterally against a conductor, of a horizontally-vibratable carrier for the trolley, a coiled spring having one end fixed in position and its other end adapted to be adjusted laterally through a path concentric with the axis of the carrier, and means permanently connected with the movable end of the spring and adapted to detachably engage with and transmit the power of the spring to said carrier, substantially as set forth.

9. The combination of an electric car or locomotive, a trolley adapted to bear laterally against an electric conductor, a rotatable support for said trolley adapted to move about a vertical axis to reverse the trolley from a forward position to a rearward position, a holder rigidly secured to the car-frame and adapted to receive said trolley-support, a coiled spring, a shaft or rod arranged at the axis of the rotatable trolley-support, and permanent connections between said shaft and the spring whereby the trolley will be held against the conductor with a uniform pressure in both its forward position and its rearward position, substantially as set forth.

10. The combination of an electric car or locomotive, a trolley adapted to bear laterally against a conductor, a horizontally-rotatable carrier for the trolley adapted to be turned to reverse the trolley from a forward position to a rearward position, a coiled spring arranged within a chamber in the car, a holder or support on the car for the trolley-carrier, a shaft or rod supported in said holder and extending into the spring-chamber, means for connecting said shaft or rod with the trolley-carrier, and means connecting said shaft or rod with the spring whereby the trolley will be held against the conductor with a uniform pressure whether the latter is in its forward position or in its rearward position, substantially as set forth.

11. The combination of an electric car or locomotive, a trolley adapted to bear laterally against a conductor, a horizontally-vibratable base for said trolley, a holder permanently fixed on the car and having at its upper end a socket adapted to receive said vibratable base, a shaft rotatably mounted in said holder and engaging with said vibratable base, a spring connected with said shaft to hold the trolley against the conductor, and a stop, as at R, mounted on said shaft and adapted to limit the lateral movement of the trolley, substantially as set forth.

12. The combination of an electric car or locomotive, a trolley adapted to bear laterally against a conductor, a horizontally-vibratable base for said trolley, a tubular holder permanently fixed on the car, and adapted to receive and support said vibratable base, a shaft rotatably mounted in said holder, a spring having one end connected with a lug projecting laterally from said shaft and acting to hold the trolley against the conductor, and a stop R secured to said shaft and projecting through a slot in the holder for limiting the lateral movement of the trolley, substantially as set forth.

13. The combination of an electric car or locomotive, a trolley adapted to bear laterally against a conductor, means for reversing said trolley from a forward position to a rearward position, a spring adapted to press the trolley laterally against the conductor whether it be in its forward position or in its rearward position, and a supplemental spring for maintaining the trolley in the horizontal planes of the conductor, substantially as set forth.

14. The combination of an electric car or locomotive, a trolley adapted to bear laterally against an electric conductor, a support for the trolley mounted on the car and having an inclined pole, said support being rotatable to reverse the pole from a forward-inclined position to a rearward-inclined position, a spring arranged to hold the trolley laterally against the conductor both when it is in its forward position, and when it is in its rearward position, a supplemental spring for adjusting the trolley vertically, and a positive stop for limiting the downward movement of the trolley, substantially as set forth.

15. The combination with a car, of a current-conducting trolley arranged to bear against the side of the conductor, a pole or carrier for the trolley comprising a pair of parallel bars arranged side by side to constitute a two-part pole F, a carrier to which the lower parts of the pole are pivoted, arranged to turn in a horizontal plane, means which tend to move the pole horizontally toward the conductor, and pivotal connecting means between the upper ends of the two parts of the trolley pole or carrier and the trolley, substantially as set forth.

16. The combination with a car, of a current-conducting trolley arranged to bear against the side of the conductor, a carrier for the trolley comprising a pair of parallel arms pivotally connected at their upper ends with the trolley, and a carrier for the trolley-pole arranged to turn in a horizontal plane, and to which the parts of the trolley-carrier are pivotally connected, the pivotal connections between the parts of the trolley pole or carrier and the trolley being parallel with the pivotal connections of the said carrier, and means which tend to move the trolley horizontally toward the conductor, substantially as set forth.

17. The combination of a trolley adapted to bear against the side of a conductor, an inclined pole or carrier for the same movable upward and downward means for maintaining the said trolley in the horizontal planes of the conductor and means for maintaining the horizontal position of said trolley during such movement of the pole or carrier.

18. The combination with a car and an electrical conductor, of a current-conducting trolley adapted to bear against the side of the conductor an inclined two-part pole or carrier for the same, the two parts of which are severally connected with the trolley and with the car and are relatively movable, as said pole rises and falls to preserve the proper relation of the trolley to the conductor and means for maintaining the said trolley in the horizontal planes of said conductor.

19. The combination with a trolley adapted to bear against the side of a conductor, of a two-part pole or carrier, the two parts of which are severally connected with the trolley and with the car and are relatively movable, and means for maintaining the trolley in the horizontal planes of the conductor, substantially as and for the purposes set forth.

20. The combination of a trolley having an upwardly and downwardly extending axis and adapted to bear laterally against a conductor, a pole or carrier for said trolley movable toward the conductor, means for maintaining the normal position of the trolley and its axis during the upward and downward movement of the carrier, and means for maintaining the said trolley in the horizontal planes of the conductor, substantially as set forth.

21. The combination of a trolley having an upwardly and downwardly extending axis, jointed supports for the trolley having a parallel movement adapted to maintain the normal position of the trolley and its axis during the elevation or depression of the trolley, means whereby said supports may turn to carry them to and from the conductor and means for maintaining the said trolley in the horizontal planes of the said conductor.

22. The combination with a trolley, of a carrier for the same having means for maintaining the parallelism of the trolley with its planes of action on the conductor during the bodily movement of the trolley across such planes, and means for maintaining the trolley in the horizontal planes of the conductor.

23. The combination with a side-running trolley, of a carrier for the same, means for maintaining the horizontal parallelism of the trolley with its planes of action on the conductor during the bodily movement of the trolley across the said planes, and means tending constantly to maintain the contact between the trolley and the conductor, substantially as set forth.

24. The combination with a laterally-acting trolley, of a carrier for the same comprising devices having a parallel movement for maintaining the horizontal position of the trolley, a spring for holding the trolley laterally against said conductor, and a spring for maintaining said trolley in the horizontal planes of said conductor.

25. The combination with an electrical conductor and an electrical contact device adapted to engage therewith, of an inclined carrier for said contact device having means for maintaining it in horizontal parallelism with its planes of action on said conductor during the bodily movement of the said contact device crosswise of such planes, a support for said carrier on which it is adapted to swing from a rearward to a forward position, and means for maintaining the said contact device in the horizontal planes of the said conductor.

26. The combination with a car and an electrical conductor, of a trolley or current-transmitter adapted to engage with said conductor, a support or bearing for said trolley arranged at one side thereof and a carrier for said bearing or support having a parallel movement for maintaining the said trolley in normal position, and means tending constantly to move said trolley into contact with said conductor.

27. The combination of a car, a trolley or current-transmitter, a support or bearing for the latter arranged at one side thereof, a trolley-support vibratable relative to the car and also relative to the said bearing to maintain the normal position of the trolley, and means tending constantly to move said trolley into contact with a conductor.

28. The combination with a car, of a current-conducting trolley

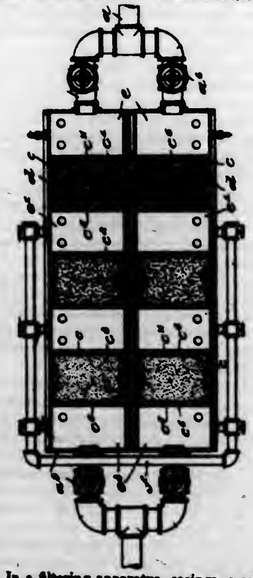
adapted to bear against the side of the conductor, a pole or carrier for the same, means tending constantly to move the pole horizontally toward the conductor, and means tending to maintain the pole normally at an inclination to the car, substantially as set forth.

29. The combination of a contact device having an upwardly and downwardly extending axis and adapted to bear laterally against a line conductor, a pole or carrier for said trolley adapted to move laterally relative to the conductor, and movable vertically on an axis transverse to the planes of engagement of said contact device with a conductor, and means tending normally to press said contact device upwardly, substantially as set forth.

30. The combination with a car and an electrical conductor, of a standard extending upwardly from said car and adapted to vibrate about both a horizontal and a vertical axis, an electrical contact device carried by said standard and adapted to engage with said conductor, a spring associated with said standard and adapted to govern its vibration in horizontal planes so as to accommodate said contact device to the lateral irregularities in said conductor, and a spring associated with said standard for controlling the vibration in vertical planes so as to accommodate said contact device to the vertical irregularities in said conductor.

31. The combination with a car of a current-conducting trolley adapted to bear against the side of a conductor, an inclined pole or carrier for the same mounted on the car to swing both vertically and horizontally, means tending constantly to move said pole horizontally toward the conductor, and means tending to control the vertical movements of said pole to maintain the trolley in the horizontal planes of the said conductor.

813,516. **FILTERING APPARATUS.** DANIEL M. PFAUTS, Germantown, Pa. Filed Dec. 27, 1904. Serial No. 238,255.

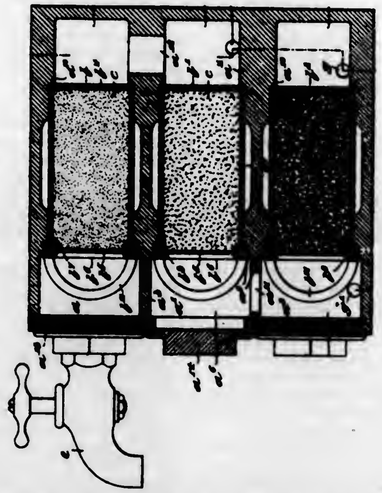


Claim.—1. In a filtering apparatus, casings, a series of filter-beds arranged in each of said casings forming chambers and having an inlet for water to be filtered and an outlet for filtered water, outlets in the bottom of each of said chambers, a pipe connecting the upper ends of certain of the chambers of both casings with each other, said pipe adapted to conduct partially or completely filtered water from certain of the chambers of one casing into certain of the chambers of the other casing and by the opening of certain of said outlets to permit the introduced water to divide to cause the same to pass through certain of said chambers and in opposite directions through contiguous filter-beds, without changing the downward flow of the same through the said casing.

2. In a filtering apparatus, casings, a series of filter-beds arranged in each of said casings forming chambers therein, an inlet for water to be filtered and an outlet for the filtered water leading into and from each casing and adapted to permit of the flow of water to be filtered in one direction therethrough, a pipe for cleansing partially surrounding both of said casings and connecting certain chambers with each other, outlets arranged in the bottom of said chambers opposite the inlets thereto from said pipe, said pipe and the outlet of one casing adapted, when opened, to permit of a flow of cleansing-water through certain of the chambers of said casing, and through contiguous filter-beds in opposite directions and in a transverse direction with respect to the flow of the water to be filtered.

3. In a filtering apparatus, casings forming receptacles for filter-beds, said filter-beds in conjunction with said casings forming chambers to permit of the separation of a portion of the impurities from the water by gravity, and free of said filter-beds, outlets arranged in the bottom of each of said chambers and adapted to form exits for impurities from the same and the filter-beds, a U-shaped pipe surrounding one end of each of said casings and connected with certain of the chambers thereof at the upper portion, said pipe adapted to permit of the introduction of partially or completely filtered water from one of the casings into the upper end or ends of one or more of certain of the chambers of the other of said casings to cause the same by the opening of certain outlets thereof to be divided, one portion flowing directly through a chamber and other portions in opposite directions through contiguous filter-beds, without changing the downward flow of the so-divided cleansing-water.

813,517. **WATER-FILTER.** DANIEL M. PFAUTS, Germantown, Pa. Filed May 13, 1905. Serial No. 260,095.



Claim.—1. In a filter, a housing divided by partition-walls into a series of superposed compartments, each divided into three chambers, a receptacle containing filtering media removably mounted in the intermediate chamber of said chambers to form a row of superposed free chambers at each end of said receptacles, an opening in each of the partition-walls opposite to each other and adapted to connect two superposed or end chambers with each other and to form a passage-way from one compartment to the other, an inlet and an outlet for water at each end of said housing and in the last chamber of the lowermost and in the first chamber of the uppermost compartment, said inlets and outlets adapted to reverse the flow of water through said filter-receptacles and the rows of superposed chambers, and said openings in said partition-walls, in conjunction with said chambers, adapted to permit of the alternate passing of water from opposite sides through said filter-receptacles within said housing.

2. In a filter, a housing divided by partition-walls into a series of superposed compartments, each divided into three chambers, receptacles containing filtering media removably mounted in the intermediate chamber of said chambers to form a row of superposed free chambers at each end of said receptacles, an opening in each of the partition-walls opposite to each other and adapted to connect two superposed or end chambers with each other to permit sediment precipitated to accumulate in one of said directly-connected chambers and to form a passage-way from one compartment to the other, an

inlet and an outlet for water at each end of said housing and in the last chamber of the lowermost and in the first chamber of the uppermost compartment, the inlet of one chamber and the outlet of the other of said chambers adapted when alternately opened to reverse the flow of water through said filter-receptacles and said chambers, and said openings in said partition-walls in conjunction with said chambers adapted to permit of the alternate passing of water from opposite sides through said filter-receptacles within said housing.

3. In a filter, a housing divided by partition-walls into a series of superposed compartments, each divided into three chambers, a receptacle containing filtering media removably mounted in the intermediate chamber of said chambers to form a row of superposed free chambers for the accumulation of sediment at each end of said receptacles, an opening in each of the partition-walls opposite to each other therein and adapted to connect two superposed or end chambers with each other to permit the sediment precipitated to accumulate in the lowermost one of said directly-connected chambers and to form a passage-way from one compartment to the other, an inlet and an outlet for water to be filtered at each end of said housing and in the last chamber of the lowermost chamber and in the first chamber of the uppermost compartment, the inlet of one chamber and outlet of the other of said chambers adapted when alternately opened to reverse the flow of water through said chambers within said housing and said openings in said partition-walls adapted to permit of the alternate passing of water from opposite sides through said filter-receptacles, and outlets for water arranged in each of the lower chambers of the connected chambers adapted to permit of the removal of the sediment therefrom.

4. In a filter, a housing divided by partition-walls into a series of superposed compartments, each divided into three chambers, tubes or cylinders closed at each end by a perforated disk holding filtering media in position therein and removably mounted in the intermediate chamber of said chambers to form a row of superposed free chambers for the accumulation of sediment at each end of said cylinders, an opening arranged in each of the partition-walls opposite each other and adapted to connect two superposed or end chambers with each other to permit the sediment precipitated therein to accumulate in the lower chamber of said directly-connected chambers and to form a passage-way from one compartment to the other, an inlet for water arranged in the last chamber of the lowermost and in the first chamber of the uppermost compartments respectively, and outlets for water arranged in each of the lower chambers of the connected chambers, said inlets and outlets for water adapted, when opened, to permit of the flow of water from opposite ends within said housing and of the removal therefrom of sediment from the lower chamber of each of the connected chambers.

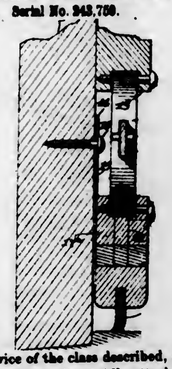
5. In a filter, a housing divided by partition-walls into a series of superposed compartments, each divided into three chambers, tubes or cylinders closed at each end by a perforated disk holding filtering media in position therein and removably mounted in the intermediate chamber of said chambers to form a row of superposed free chambers for the accumulation of sediment at each end of said cylinders, an opening in each of the partition-walls opposite each other and adapted to directly connect two end chambers with each other to permit sediment precipitated to accumulate in the lower chamber of said connected chambers and to form in conjunction with said chambers a passage-way from one compartment to the other, an inlet and an outlet for water at each end of said housing and in the last chamber of the lowermost and in the first chamber of the uppermost compartments respectively, and an outlet for water in each of the lower chambers of the directly-connected superposed chambers, said inlets and outlets with the exception of the outlet of the first uppermost chamber adapted, when opened, to permit of the direct cleaning of the last of the lowermost chambers forming normally the entrance-chamber for water to be filtered containing the greatest amount of impurities and of the cleaning of the filter-beds and removal of precipitated impurities from the lower chambers of the connected superposed chambers by dividing the water entering the casing from opposite ends and flowing in opposite directions toward each other and permitting of the redivision of both portions so as to permit one portion to pass through the outlets of these chambers without passing through the filter-beds and of the other portion passing therethrough to reach said outlets.

6. A filter, consisting of a casting divided by partition-walls into a series of superposed compartments, each divided into three chambers, tubes or cylinders containing filtering media mounted in the intermediate chambers of said compartments, each of said intermediate chambers having a threaded portion at one end, a ring arranged at the threaded end of each of said cylinders having two threaded projections, the inner one adapted to receive the threaded end of a cylinder and the outer one adapted to connect the same with said intermediate chamber by engaging the threaded portion thereof.

7. A filter, consisting of a casting divided by partition-walls into a series of superposed compartments, each divided into three chambers, two of said chambers forming a shoulder between the same, tubes or cylinders containing filtering media mounted in the intermediate chambers of said compartments, each of said intermediate chambers having a threaded portion at one end, a ring arranged at the threaded end of each of said cylinders having two threaded projections forming an annular chamber and flanges projecting beyond said projections, a disk adapted to close the threaded end of a cylinder and to be held in position therein by the inner of said flanges, said inner threaded projection adapted to engage the threaded end of the cylinder and the outer threaded projection adapted to connect the cylinder with the intermediate chamber by engaging its threaded portion and the outer flange adapted to render the connection water-tight by engaging the shoulder formed between the first and intermediate chambers respectively of said compartments.

8. A filter, consisting of a casting divided by partition-walls into a series of superposed compartments, each divided into three chambers, two of said chambers forming a shoulder between the same, tubes or cylinders containing filtering media mounted in the intermediate chambers of said compartments, each of said intermediate chambers having a threaded portion at one end, a ring arranged at the threaded end of each of said cylinders having two threaded projections forming an annular chamber and flanges extending beyond said projections, a disk adapted to close the threaded end of the cylinder and to be held in position therein by the inner of said flanges, said inner threaded projection adapted to engage the threaded end of the cylinder and the outer threaded projection adapted to connect the cylinder with the intermediate chamber by engaging its threaded portion and the outer flange adapted to render this connection water-tight by engaging the shoulder formed between the first and intermediate chambers of said compartments, and a handle connected with each of said rings and adapted to permit of the disconnection of the filter-tube from its chamber to remove the same therefrom.

813,518. **WEATHER-STRIP.** JACOB H. PISOR, Electric, Mont. Filed Feb. 1, 1905. Serial No. 243,750.



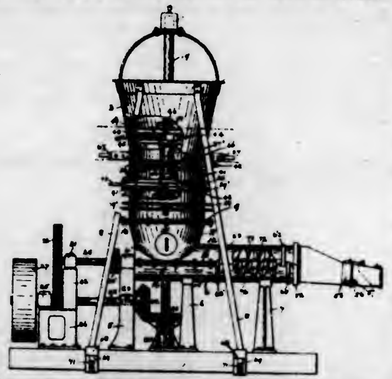
Claim.—1. A device of the class described, comprising in combination a door, a strip, means for rigidly attaching the same to the door, a plate, means for movably attaching the plate to a door, a weather-strip rigidly connected to the plate, means connecting the strip and plate whereby a closing movement of the door moves the plate and weather-strip into operative engagement, and means whereby the plate and weather-strip may be adjusted relative to the strip and door and at each end independently of the other.

2. A device of the class described, comprising a plate, a weather-strip rigidly connected to the plate, a rail connected with the plate, means whereby the rail may be adjusted at each end independently relative to the plate, a strip spaced from the rail, curved resilient members connecting the rail and strip in parallelism, and a bar connected to the middles of the resilient members and extending parallel with and somewhat beyond the rail and strip.

813,519. **AERIAL TOP.** ALBERT L. PLATT, Clinton, Ill. Filed June 20, 1905. Serial No. 266,121.

Claim.—An aerial top, comprising a tubular supporting-handle provided near its upper end with a transversely-disposed cord-holding guide-eye, and in its top edge in a higher plane than the eye with a downwardly-sloping drawing-kerf, said handle being also provided at its top edge with an enlarged housing-socket, a whirling member consisting of a spinning-stem lying within the bore of the supporting-handle, and a propeller-blade carried by said stem, and an operating-cord passing through the guide-eye and drawing-kerf and having its portion between these elements arranged about said stem in a single spiral wrap, the latter being arranged to operate in said housing-socket.

813,520. PEAT-MILL. FERDINAND A. PRITSCHAU, Toledo, Ohio, assignor to The Commercial Artificial Fuel Company, Toledo, Ohio, a Corporation of Arizona. Filed Apr. 24, 1905. Serial No. 257,065.



Claim.—1. In a disintegrating-mill, the combination with a hopper-casing, and a vertical shaft axial to the casing and revoluble therein, of a disintegrator comprising a stationary spider having a central journal-bearing for the shaft, and a plurality of arms extending radial from the bearing in a horizontal plane and secured by their outer ends to the wall of the casing, and a revolving spider having a central hub adapted to be fixedly mounted on the shaft, and a plurality of arms respectively extending tangential and eccentric from the hub, at intervals around the hub, in a plane parallel with the plane of the arms of the fixed spider, and, as respects direction of revolution, rearward of radial lines parallel with the arms, the arms of the spiders each having a plurality of pin-teeth at intervals of their length, the teeth of the revolving spider being located to pass through intervals between teeth of the stationary spider, and means to revolve the shaft toward the angles of the arms.

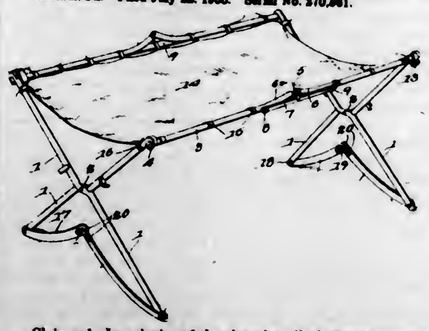
2. In a mill for reducing peat and other fibrous materials, the combination with a hopper-casing and a vertical shaft axial to the casing and revoluble therein, of knives secured at intervals to the wall of the casing, and extending inward radial to the shaft in a common plane transverse the shaft, and a shear-spider mounted on and revoluble with the shaft, said spider having a central hub portion by which it is mounted on the shaft, and a plurality of shear-blades extending at intervals tangential and eccentric from the hub in a plane parallel with the plane of the knives, adapting the edges of the shear-blades, as the shaft revolves, to progressively shear past the edges of the knives, from their outer toward their inner ends, with the edges of the blades forward as to the direction of movement, and rearward of radial lines parallel therewith.

3. In a mill for reducing peat and other fibrous earthy material, the combination with a hopper-casing and a vertical shaft axial to the casing and revoluble therein, of knives detachably secured at intervals in the wall of the casing, and having blade portions extending inward radial to the shaft in a common plane transverse the shaft, and handle portions extending outward from the casing, and a shear-spider having a central hub mounted and fixed on the shaft and a plurality of shear-blades extending at intervals tangential and eccentric from the hub in a plane parallel with the plane of the knives, with the edges of the blades forward as to the direction of movement, and rearward of radial lines parallel therewith, adapting the edges of the shear-blades to progressively shear past the edges of the knives from their outer ends toward the hub, as the shaft revolves.

4. In a mill for reducing peat and other fibrous earthy material, the combination of a hopper-casing having a cylindrical portion provided with a series of radial rectangular openings arranged in a series of horizontal planes, and, as respecting each plane, at regular intervals around the casing, and as respecting the series of planes in spiral order around the cylindrical portion, a vertical shaft axial to the cylindrical portion, knife-bars detachably secured in the openings radial to the shaft, and having inner portions provided with shearing edges, and outer handle portions by which the inner portions may be withdrawn from and inserted through the openings, and a series of shear-spiders one for each knife-plane, each having a central hub mounted and fixed on the shaft, and a plurality of bifurcated shear-blades extending at regular intervals, tangential and eccentric to the hub, with the edges forward as to the direction of revolution of the shaft and rearward of radial lines parallel therewith, and adapted as the shaft revolves to shear past the upper and lower edges of all the knife-bars extending in their plane.

5. In a mill for reducing peat and other fibrous earthy material, the combination with a hopper-casing mounted on a worm-casing, of a pair of worm-shafts revoluble in the worm-casing, and provided with intermeshing gear adapting one shaft to oppositely revolve the other at equal speed, and with complementary intersecting and co-acting worm-blades having opposite half-turn sections omitted in line with the axis of the hopper, a vertical pugging-shaft axial to the hopper and extending downward through the worm-casing between the worm-shafts in the interval of the omitted half-sections of the worm-blades, bearings for the upper and lower ends of the shaft, a gear-wheel mounted on the pugging-shaft, below the worm-casing, and a main driving-shaft having gear connection with the gear of the pugging-shaft and with one of the worm-shafts.

813,521. FOLDING COT AND CRADLE. MARTIN REILLY, Cheltenham, Pa. Filed July 22, 1905. Serial No. 270,961.



Claim.—1. In a device of the class described, the combination with the pivotally-connected leg members, of side bars, each formed of pivotally-connected sections, said side bars being pivotally connected to the legs, the meeting ends of the sections of the side bars having upturned end portions, latches connecting the side-bar sections, and a flexible cover having attaching-clips connected to the legs, the side-bar sections and the latches.

2. A device of the class described embodying crossed and pivoted leg members, centrally-hinged side bars pivoted to the upper ends of the leg members and having upward curves at each side of the hinges, and latches extending across and engaging the side bars at each side of the curves.

3. A device of the class described embodying crossed and pivoted leg members, one of which is provided with an offset portion at its upper end, centrally-hinged side bars pivoted to the upper ends of the leg members and having upturned curves at each side of the hinges, clips slidably mounted upon the side bar and arranged to engage and retain the offset portion of the leg member, and a latch extending across and engaging the side bars at each side of the curves.

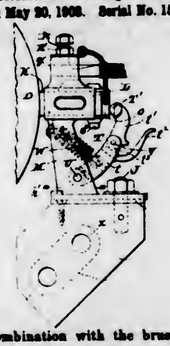
4. In a device of the class described side bars pivoted intermediate their ends and having upturned curves at each side of the pivot, means extending across the curves to hold the bars rigid and means to support the bars.

5. In a device of the class described, the combination with crossed and pivotally-connected legs, of a sectional rocker formed of a pair of bars pivotally connected to the lower ends of the legs and adjustably connected to each other, said bars being adjustable to increase or decrease the distance between the lower ends of the legs when the rockers are employed as supports, and being further adjustable to act as braces when the lower ends of the legs rest directly on the floor or other supporting-surface.

813,522. PENCIL. FRANK L. ROUSSEAU, Chicago, Ill. Filed Apr. 24, 1905. Serial No. 257,080.

Claim.—A pencil comprising a casing, having a longitudinal bore, leads therein, a clutch member of soft pliable material, having an aperture intermediate thereof, adapted to be secured in the point of the casing, said aperture being of smaller diameter than the leads, thus preventing said leads from falling out of the bore of the pencil, a sleeve provided with internal screw-threads adapted to cut threads on the exterior surface of the casing when secured thereon, a thimble secured in the upper end of the said sleeve, a longitudinal extension rigidly secured to the inner end of said thimble, and when said sleeve, with the extension secured thereon, is screwed onto the casing, the extension will fit into the bore of the pencil and force the lead therein out through the clutch member in the point of the casing.

813,523. BRUSH-HOLDER FOR MOTORS OR GENERATORS. FRANK L. SIMMONS, Columbus, Ohio, assignor to Joseph A. Jeffrey, Columbus, Ohio. Filed May 20, 1903. Serial No. 157,980.



Claim.—1. The combination with the brush-holder and the brush, of the pivoted spring-held follower formed in two parts pivotally connected together on a pivot arranged transversely of said brush, the parts being provided with means for limiting the movement of one relative to the other in one direction, and the upper one being adapted to bear against the end of the brush, substantially as set forth.

2. The combination with the brush-holder, the brush, the spring-held follower pivoted below the brush-box and formed in two parts, the outer part being connected to the inner by a pivot and having its outer end adapted to move around the said pivot in one direction and locked against movement in the other direction when bearing against the brush, substantially as set forth.

3. The combination with the brush-holder and the brush, of the pivoted spring-held follower formed in two parts, the lower part being secured by a stationary pivot and having a handle, and the upper part being secured to the lower part by a pivot and locked against movement around said pivot when bearing against the brush, substantially as set forth.

4. The combination with the brush-holder, the brush, the lead-wire-binding lug adjacent to the brush, and the flexible conductor secured to the brush and to said binding-lug, substantially as set forth.

5. The combination with the brush-holder and the brush, of the lead-wire-binding lug adjacent to the brush, the intermediate flexible conductor secured to the binding-lug and secured to the brush by two-part clamp, substantially as set forth.

6. The combination with the brush-holder and the brush, of the lead-wire-binding lug integral with the brush-box, and the flexible conductor interposed between the brush and the binding-lug and bodily detachable from both, substantially as set forth.

7. The combination of the brush movable bodily toward the commutator, means for forcing the brush toward the commutator, a brush-holder formed of two parts, and a means for causing them both to tightly clamp the brush, flexible conductors, one connected with each of the clamping parts of the brush-holder, and a contact-plate to which both the said conductors are connected, substantially as set forth.

8. In a box-motor, the combination with the armature, the commutator and the inclosing field-sections having the closed end walls supporting the armature-shaft, the bearing for the shaft projecting inwardly from the closing wall, the insulator arranged to overlap the said bearing and secured from the exterior to the said closing wall, the bodily stationary brush-holder adjustably secured to the said insulator, and the spring-held follower adapted to bear against the brush in the holder, substantially as set forth.

9. The combination with the brush-holder and the brush, of the spring-held follower bearing against the brush and having at its end adjacent to the brush a cavity in which is situated an insulator held in position by the bent-in end walls of said cavity.

10. The combination with the brush-holder, the brush and the spring-held follower bearing against the brush, of the piece of insulating material T′ having the notches t^3 in its ends, the upper end of the said follower having a cavity t^4 into which the said piece of insulating material is fitted and the end walls of which are bent into the notches t^3 of said piece of insulating material to fasten it in place.

813,524. FRAME FOR WIND-SHIELDS FOR AUTOMOBILES. JAMES C. SIMS, Jr., and ANDREW P. OLSON, Chicago, Ill. Filed July 17, 1905. Serial No. 270,148.

Claim.—1. A rectangular frame for transparent wind-shields comprising interiorly-slotted metallic tubular parts and means for making one of said parts adjustable upon and detachable from its adjacent parts, in combination with grooved parts of elastic stuff fitted in the bore of the tubular parts the grooves in the elastic stuff being of less width than the slots of the tubular parts and arranged to coincide therewith and form an open, straight elastic groove around the interior of the frame, as specified.

2. A rectangular frame of the class mentioned comprising metallic tubular parts each provided with a slot along its inner side, one of said members having eyes and set-screws at its ends adapted to slide over and in line with the adjacent transverse parts, in combination with grooved parts of elastic stuff fitted in the bore of the tubular parts said groove being of less width than said slot.

3. A rectangular frame of the class mentioned comprising slotted tubular parts, one of said parts provided with eyes at its ends adapted to slide upon and in line with the adjacent transverse parts having greater length than the frame and provided with taper ends, in combination with the dashboard provided with eyes adapted to receive and hold the taper ends of said adjacent transverse parts, as specified.

4. A rectangular frame of the class mentioned comprising in combination slotted tubular parts one of said parts being provided

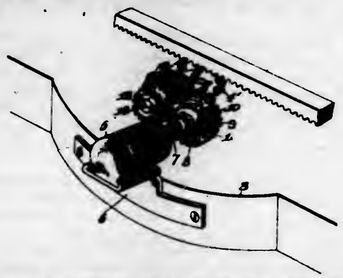
813,527. CLAM-SHELL BUCKET. JOHN C. SLOCUM, Columbus, Ohio, assignor to Joseph A. Jeffrey, Columbus, Ohio. Filed June 26

11. The combination of the bucket, the frame, two bucket-sup-

813,528. CLAM-SHELL BUCKET. JOHN C. SLOCUM, Columbus, Ohio, assignor to Joseph A. Jeffrey, Columbus, Ohio. Filed July 5,

4. A rectangular frame of the class mentioned comprising in combination slotted tubular parts one of said parts being provided with means whereby it is adapted to slide upon and in line with the adjacent transverse parts having greater length than the frame, grooved parts of elastic stuff fitted in the bore of the tubular parts and means for securing said sliding part in place upon said adjacent transverse parts with their ends projecting at one side of the frame to serve as a means of support therefor, as specified.

818,525. CYCLOMETER ATTACHMENT FOR TYPE-WRITING MACHINES. Gaman W. Simson, St. Louis, Mo. Filed July 17, 1905. Serial No. 270,162.



Claim.—1. A cyclometer attachment for type-writing machines comprising a cyclometer; a bracket supporting the same on the frame of the type-writer; a shaft communicating with and operating the cyclometer mechanism; an escapement mechanism of a type-writer, and means between the escapement mechanism and the cyclometer-shaft for operating the cyclometer, substantially as set forth.

2. In a cyclometer attachment for type-writers, the combination of a cyclometer provided with a shaft arranged to be operated thereby, a gear-wheel loosely mounted thereon, the escapement mechanism of the type-writer provided with a shaft and gear-wheel arranged to mesh with the loosely-mounted gear-wheel, and pawl-and-ratchet means between the loosely-mounted gear-wheel and the cyclometer-shaft, whereby the latter is operated when the escapement mechanism moves in one direction, but remains at rest when moved in the other direction.

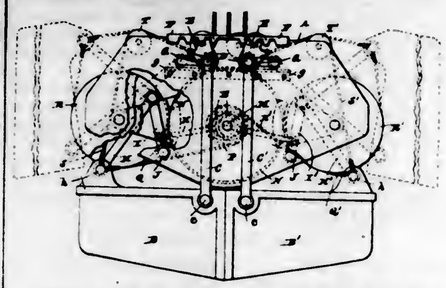
3. A cyclometer attachment for type-writing machines comprising a cyclometer suitably supported to the frame of the type-writer; a shaft communicating with the internal mechanism of the cyclometer; a ratchet-wheel rigidly mounted upon said shaft; a gear-wheel loosely mounted upon said shaft an escapement mechanism of a type-writer, a shaft operated by the escapement mechanism provided with a gear-wheel arranged to mesh with the loosely-mounted gear-wheel, and a pawl connected to the latter arranged to operate the cyclometer-shaft in one direction.

818,526. GROUND CONNECTION FOR ELECTRIC CIRCUITS. Joseph B. Simpson, Washington, D. C., assignor of one-half to Cornelius R. Thomas, Washington, D. C. Filed Apr. 11, 1905. Serial No. 254,923.

Claim.—1. In a ground connection for electric circuits, a clamp including two metallic strips, one having an elongated slot, and the other being provided with a plurality of pairs of shoulders for engagement with the end wall of the slot, and means for clamping said strips around the pipe.

2. In a ground connection for electric circuits, a pipe-clamp including two metallic strips, one end of one of the strips having an elongated slot, and one end of the other strip being provided with a plurality of pairs of shoulders for engagement with the end wall of the slot, the opposite ends of the two strips being turned outward and bent to form reinforcing-ears, said ears being perforated, and a clamping-bolt extending through said ears and serving, also, as a binding-post for the current-conducting wire.

818,527. CLAM-SHELL BUCKET. John C. Slocum, Columbus, Ohio, assignor to Joseph A. Jeffrey, Columbus, Ohio. Filed June 20, 1903. Serial No. 162,033.



Claim.—1. The combination of the bucket, the frame, means for supporting the heel of the bucket, and the vibrating depending bucket-supporting link pivotally connected to the bucket at its front end, and having its upper end movable bodily inward and outward as the bucket moves inward and outward, respectively, substantially as set forth.

2. The combination of the bucket, the frame, means for supporting the heel of the bucket, and the depending vibratable, bucket-supporting link pivotally connected to the bucket at its front end, and means for positively moving the upper end of the link bodily inward and outward as the bucket moves inward and outward, respectively, substantially as set forth.

3. The combination of the bucket, the frame, means for supporting the heel of the bucket, and the depending vibratable bucket-supporting link pivotally connected to the bucket at its front end, and having its upper end bodily movable and supported on a roller movable relative to said frame, substantially as set forth.

4. The combination of the bucket, the non-rotary frame, means for supporting the heel of the bucket, and the depending vibratable, bucket-supporting link pivotally connected to the bucket at its front end and having its upper end bodily movable relative to said non-rotary frame and supported against friction, and means for positively moving the upper end of the link in and out relatively to said frame as the bucket moves, substantially as set forth.

5. The combination of the bucket, the non-rotary frame, the power mechanism, means for connecting the power mechanism to the heel of the bucket, and a swinging support sustaining the front end of the bucket and movable bodily relatively to the non-rotary frame, in and out, substantially as set forth.

6. The combination of the bucket, the frame, means for sustaining the heel of the bucket, the power mechanism connected to the heel of the bucket, the vertically-swinging support for the front end of the bucket, and means for positively moving the upper part of the swinging support bodily inward relative to the frame as the bucket closes, substantially as set forth.

7. The combination of a bucket, the non-rotary frame, means for supporting the heel of the bucket, the supporting-link having its lower end pivotally connected to the front end of the bucket and its upper end bodily movable inward and outward relative to the said non-rotary frame as the bucket moves, substantially as set forth.

8. The combination of the bucket, the non-rotary frame, means for supporting the front end of the bucket, heel-supporting means for the bucket, and means for moving bodily inward relatively to the said non-rotary frame both the front support for the bucket and the heel-supporting means as the bucket closes, substantially as set forth.

9. The combination of the bucket, the frame, a vertically-vibrating support for the front end of the bucket, having its upper end supported on an axis bodily movable relative to the frame, heel-supporting means for the bucket, and means for moving bodily inward relatively to the frame both the heel-supporting means and the upper end of the vertically-swinging support for the front end of the bucket, substantially as set forth.

10. The combination of the frame, the bucket, the power mechanism, means for supporting the front end of the bucket, the vertically-swinging support for the heel of the bucket, and means actuated by the power mechanism for positively drawing inward bodily relatively to the frame the axis of the heel-supporting means and the supporting means for the front end of the bucket as the bucket closes, substantially as set forth.

11. The combination of the bucket, the frame, two bucket-supporting links respectively connected pivotally to the front end and to the heel end of the bucket, and each being bodily movable at both ends, in and out as the bucket moves in and out, respectively and means for applying power for the closing of the bucket, substantially as set forth.

12. The combination of the bucket, the frame, the two bucket-supporting links respectively pivoted to the front of the bucket and to the heel of the bucket, and each link swinging vertically around an axis at its upper end, which is bodily movable in and out as the bucket moves in and out, respectively, substantially as set forth.

13. The combination of the bucket, the frame, and the bucket-supporting links respectively pivoted to the front end of the bucket and to the heel of the bucket, and each link being supported on an axis which moves inward when the bucket is closing and outward when the bucket is opening, substantially as set forth.

14. The combination of the frame, the bucket, the power mechanism, means for supporting the heel of the bucket, and the swinging arm for the front end of the bucket, and the support for the upper end of said arm interposed between it and the frame and bodily movable with the arm relatively to the frame, substantially as set forth.

15. The combination of the bucket, the frame, the support for the rear end of the bucket, the closing-rope connected to the rear end of the bucket, the wheel-like guide interposed between the bucket and the power mechanism for guiding the closing-rope, and the vertically-swinging link for the front end of the bucket having its upper end supported on an axis which moves bodily inward and outward as the bucket moves, substantially as set forth.

16. The combination of the bucket, the frame, the support for the front end of the bucket movable bodily on the frame, the support for the rear end of the bucket movable bodily relatively to the frame, the power-shaft, the closing-rope connected to the heel of the bucket, and the antifriction rope-guide disconnected from the rope and the bucket, substantially as set forth.

17. The combination of the bucket, the frame, a vertically-swinging link-like support for the heel of the bucket moving around a horizontal axis at its upper end, the power-shaft, the closing-rope connected to the power-shaft and extending therefrom to the heel of the bucket, the wheel-like guide for the closing-rope, the link supporting the front end of the bucket and having its upper end supported on the frame by a bodily-movable carrier, and means for causing the upper end of the link to move bodily inward and outward, substantially as set forth.

18. The combination of the bucket, the frame, the means for movably supporting the front end of the bucket, the two links or arms for supporting the heel of the bucket upon the frame, the power mechanism, the eccentrics and eccentric-rods connected to the two links and adapted to bodily move the axis which joins them inward and outward, substantially as set forth.

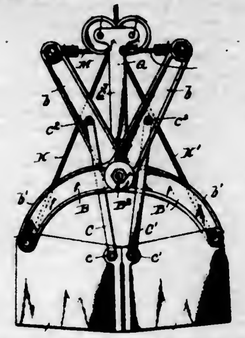
19. The combination of the bucket, the frame, the link or arm pivoted to the heel of the bucket, the link or arm pivoted to the frame and to the heel-link, the power mechanism means connecting the power mechanism with the said links to swing them outward and inward as the bucket moves, and a depending link pivotally connected to the front end of the bucket and having its upper end bodily movable inward and outward as the bucket moves, substantially as set forth.

20. The combination of the bucket, the frame, the link or arm pivoted to the heel of the bucket, the link or arm pivoted to the frame and to the heel-link, the power mechanism, means connecting the power mechanism with the said links to swing them outward and inward as the bucket moves, the closing-rope extending from the power mechanism to the heel of the bucket, and the depending link pivoted to the front of the bucket and pivotally supported from the frame, substantially as set forth.

21. The combination of the bucket, the frame, the supporting devices for the front end of the bucket, the supporting devices for the rear end of the bucket, and a rack and pinion interposed between one of said supporting devices and the frame to cause it to move bodily inward and outward as the bucket moves, substantially as set forth.

22. The combination of the bucket, the frame, the supporting devices for the front end of the bucket, the supporting devices for the rear end of the bucket, the rack and pinion interposed between one of said supporting devices and the frame to cause it to move bodily inward and outward as the bucket moves, and the power mechanism connected to the other supporting device of the bucket, substantially as set forth.

818,528. CLAM-SHELL BUCKET. John C. Slocum, Columbus, Ohio, assignor to Joseph A. Jeffrey, Columbus, Ohio. Filed July 6, 1904. Serial No. 215,548.



Claim.—1. In a grab-bucket the combination with two opposing bucket-sections, of the operating-levers each having its lower end pivotally connected to the rear portion of one of the bucket-sections, the levers being arranged to cross each other intermediate of their ends, the links connecting the front portions of each of said bucket-sections to the operating-lever for the opposing bucket-sections, and the ropes for closing the bucket-sections together connected to the upper end of said operating-levers and adapted to draw the said ends toward each other.

2. In a grab-bucket the combination with a pair of opposing bucket-sections, of the operating-levers each connected at its lower end to the rear portion of one of said bucket-sections, the levers for the respective sections crossing each other at points intermediate of their ends, the links connecting the front portions of each bucket-section with the operating-lever of the opposing bucket-section, the supporting-frame, the rope-guiding devices on said frame and the closing-rope connected to the upper end of each of said operating-levers and passing around said guiding devices on the frame and adapted to draw the upper ends of said levers together.

3. In a grab-bucket the combination with two opposing bucket-sections, of a transversely-arranged shaft, the operating-levers mounted on said shaft at points between their respective ends and having their lower ends connected with the said bucket-sections, the links connecting said bucket-sections with the operating-levers of the opposing bucket-sections, the frame having a bearing for said shaft, the rope-guiding devices carried by said frame and the closing-ropes for the mechanism extending around said guiding devices and connected with the upper ends of said levers.

4. In a grab-bucket the combination with two opposing bucket-sections of the operating-levers, each having its lower end connected to the rear portion of one of said bucket-sections, the said levers crossing each other at points between their respective ends, links connecting the front ends of each of said bucket-sections with the operating-lever for the opposing bucket-section, the rope-guiding devices supported between said operating-levers and the ropes each connected to the rear of one of said bucket-sections and extending around said guiding devices.

5. In a grab-bucket the combination with a pair of opposing bucket-sections, of the operating-levers pivotally connected together intermediate of their ends and each connected at its lower end to the rear of one of said bucket-sections, the links connecting the front end of each of said scoops or bucket-sections with the operating-lever for the opposing section, the rope-guiding devices secured to the upper ends of the operating-lever, the supporting-frame, the rope-guiding devices secured to said frame and the ropes associated with said guiding devices and arranged to draw the upper ends of said operating-levers toward each other.

6. In a grab-bucket the combination with the two opposing bucket-sections, of the transversely-arranged shaft, the operating-levers each connected at its lower end to the rear end of one of said bucket-sections and mounted between its ends upon said transverse shaft, the frame having a bearing for said shaft, the rope-guiding devices on said frame and the ropes having their ends secured to said frame, connected with the upper ends of said operating-levers and extending around said guiding devices.

7. In a grab-bucket the combination with a pair of opposing bucket-sections of the transverse shaft, the operating-levers mounted

on said shaft at points intermediate of their ends and having their lower ends connected with the rear ends of said bucket-sections, the links connecting the front ends of each of said bucket-sections with

ing movements of said bucket-sections, each connected to the operating-levers for one of said bucket-sections near their lower ends,

wheel-rim, a series of blocks or sections secured side by side to said band, a clamping-band encircling the blocks, the ends of both of said

stined-paper-holding spring wound around the pintle-bolt pivotally securing the members to the frame, one end of the main-

on said shaft at points intermediate of their ends and having their lower ends connected with the rear ends of said bucket-sections, the links connecting the front ends of each of said bucket-sections with the operating-lever for the opposing section, the frame having a bearing for the said shaft, the rope-guiding devices supported by each of said operating-levers near its top, the rope-guiding devices supported on said frame and the ropes extending around said guiding devices and secured to said frame.

8. In a grab-bucket the combination with two opposing bucket-sections, of a pair of levers pivotally connected together intermediate of their ends, each of said levers being connected at its lower end to the upper rear corner of one of said bucket-sections, the links of each pivotally connected at its lower end to the upper front corner of one of said bucket-sections and at its upper end to the operating-lever for the opposing bucket-section, the supporting-frame, the rope-guiding devices on said frame, the rope-guiding devices at the upper end of each of said operating-levers, and the closing-ropes, each secured at one end to the supporting-frame and extending around one of the guiding devices on the operating-levers and one of the guiding devices on said supporting-frame.

9. In a grab-bucket, the combination with two opposing bucket-sections, of means connected to the rear end of each of said bucket-sections for controlling the closing movements of said bucket-sections, and independent means also connected with the rear ends of each of said bucket-sections for controlling the opening movements thereof.

10. In a grab-bucket, the combination with two opposing bucket-sections, of means connected to the rear end of each of said bucket-sections for controlling the opening movements of the buckets, means connecting the front ends of each of said buckets with the said means for controlling the opening of the bucket-sections, and independent means for controlling the opening movements of the bucket-sections.

11. In a grab-bucket, the combination with two opposing bucket-sections, of means connected to the upper rear corners of each bucket-section for controlling the closing movements of the bucket-sections, and independent means also connected to the upper rear corners of said bucket-sections for controlling the opening movements thereof.

12. In a grab-bucket, the combination with two opposing bucket-sections, of means connected to the upper rear corners of each bucket-section for controlling the closing movements of the bucket-sections, independent means also connected to the upper rear corners of said bucket-sections for controlling the opening movements thereof, and means for controlling the front ends of each of said bucket-sections, said latter means being connected with and controlled by the means for closing the bucket-sections together.

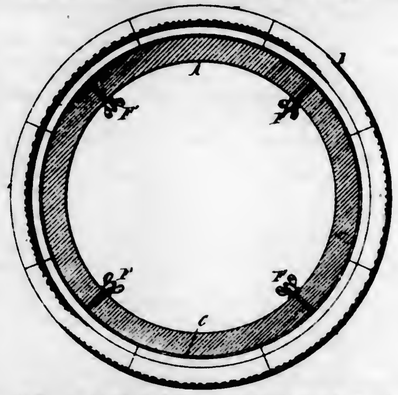
13. In a grab-bucket, the combination with two opposing bucket-sections, of the crossed operating-levers, each connected at its lower end to the rear end of one of said bucket-sections, the links connecting the front ends of said bucket-sections with the operating-lever connected to the rear end of the opposing bucket-section, means connected with said operating-levers for controlling the opening movements of said buckets, and independent means connected with said operating-levers for controlling the closing movements of said buckets.

14. In a grab-bucket, the combination with two opposing bucket-sections, of the crossed operating-levers, each having its lower end pivotally connected to the rear end of one of said bucket-sections, the links, each connected at its lower end to the front end of one of said bucket-sections, and its upper end to the lever which controls the rear end of the opposite bucket-section, the ropes for controlling the opening movements of the bucket-sections, and the ropes connected to the upper ends of said operating-levers for controlling the closing movements of said bucket-sections.

15. In a grab-bucket, the combination with two opposing bucket-sections, of the operating-levers, each having its lower end pivotally connected to the rear portion of one of said bucket-sections, the levers being arranged to cross each other intermediate of their ends, the links connecting the front portion of each of said bucket-sections to the operating-lever for the opposing bucket-section, means for controlling the opening movements of said bucket-sections, and independent means connected with said operating-lever for controlling the closing movements of said bucket-sections.

16. In a grab-bucket, the combination with two opposing bucket-sections, of crossed operating-levers, each having its lower end pivotally connected to the rear end of one of said bucket-sections, the links, each connected at its lower end to the front end of one of said bucket-sections and at its upper end to the operating-lever for the opposing bucket-section, ropes for controlling the opening movements of said bucket-sections, each connected to the operating-levers for one of said bucket-sections near their lower ends, and means for controlling the closing movements of said bucket-sections connected with the upper end of said operating-levers.

818,529. TIRE. RUSSELL G. SMITH, Buffalo, N. Y., assignor of one-half to Auto-Car Equipment Company, Buffalo, N. Y., a Corporation of New York. Filed Jan. 14, 1905. Serial No. 241,023.



Claim.—1. An emergency-tire, comprising a flexible band adapted to encircle a wheel-rim, a series of blocks or sections secured side by side to said band by fastenings passing through the band and into the blocks, and means independent of said fastenings for securing the tire to the wheel-rim, substantially as set forth.

2. An emergency-tire, comprising a flexible band adapted to encircle a wheel-rim, a series of blocks or sections secured side by side to the band and constructed and arranged to form the tread of the tire, and a binding member engaging the blocks beyond the face of said flexible band, substantially as set forth.

3. An emergency-tire, comprising a flexible band, a series of blocks or sections secured side by side thereon, a clamping-band encircling the blocks, and means for contracting and tightening said clamping-band, substantially as set forth.

4. A tire comprising a series of blocks or sections arranged side by side and each provided in its tread-face with a longitudinal groove, a clamping-band seated in said grooves, and means for tightening said band, substantially as set forth.

5. A tire comprising a series of blocks or sections arranged side by side, one or more thereof being provided in their tread-faces with recesses, a clamping-band encircling said blocks, and fastening means for the band acting to displace portions of the same into said recesses, substantially as set forth.

6. A tire comprising a series of blocks or sections arranged side by side, one or more thereof being provided in their tread-faces with recesses, a clamping-band encircling said blocks, and fastening-bolts passing through the band and the recessed blocks in line with said recesses and having their heads countersunk in the latter, substantially as set forth.

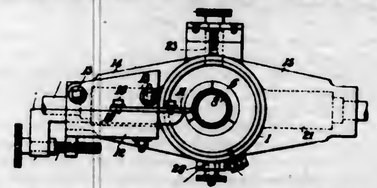
7. A tire comprising a series of blocks or sections arranged sid by side and each provided in its tread-face with a longitudinal groove and one or more thereof having recesses located in their grooves, a clamping-band seated in said grooves, and radial fastening-bolts passing through the band and the recessed blocks in line with the recesses, substantially as set forth.

8. A tire comprising a flexible band, a series of blocks secured side by side to said band and having longitudinal grooves in their tread-faces, a clamping-band seated in said grooves, and means for fastening one or more of the blocks to a wheel-rim, substantially as set forth.

9. A tire comprising a flexible band, a series of blocks secured side by side to said band and having longitudinal grooves in their tread-faces, one or more of said blocks being provided in their grooves with recesses, a clamping-band seated in said grooves, and fastening-bolts passing through said clamping-band and the recessed blocks in line with said recesses and having their heads seated in the latter, substantially as set forth.

10. A tire comprising a flexible band adapted to encircle a wheel-rim, a series of blocks or sections secured side by side to said band, a clamping-band encircling the blocks, the ends of both of said bands being located adjacent to the same block, and means for fastening the blocks and the clamping-band in place, substantially as set forth.

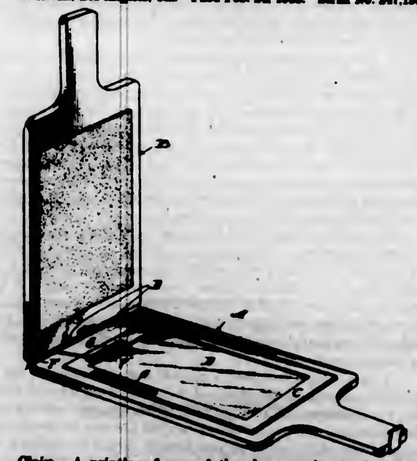
818,530. APPARATUS FOR HOLDING, TURNING, THREADING, AND CUTTING PIPES. MURRAY H. SUGAR, London, England, assignor, by direct and mesne assignments, to Derrington Elliott Burrows, London, England. Filed Oct. 26, 1903. Serial No. 178,220.



Claim.—1. In apparatus for holding, turning, threading and cutting pipes, and in combination, an outer loose sleeve carrying the tools, an inner fixed cylinder carrying the work and having an annular groove upon its outer surface, means for holding the work immovably within the apparatus, means for permitting both rotative and longitudinal motion of the loose sleeve during the turning and threading operations, and means carried by the loose sleeve comprising a slotted bar adapted to engage the groove in said fixed cylinder, guides within which said bar is longitudinally slidable and a nut and screw for tightening the bar in the guides to lock the sleeve against longitudinal motion at any desired point in its travel to permit of rotative motion only for the cutting operation.

2. In apparatus for holding, turning, threading and cutting pipes, and in combination, an outer loose sleeve carrying the tools, an inner fixed externally-grooved cylinder screw-threaded upon its outer surface carrying the work, means for holding the work immovably therein, a screw-threaded block carried by said loose sleeve, a nut and screw for lowering and raising said threaded block into and out of engagement with the threads upon the cylinder for permitting longitudinal motion of the sleeve when desired, and means carried by the sleeve comprising a slotted bar adapted to engage the groove in said fixed cylinder, guides within which said bar is longitudinally slidable and a nut and screw for tightening the bar in the guides to lock the sleeve against such longitudinal motion at any desired point of its travel to permit of rotative motion only for the cutting operation.

818,531. PHOTOGRAPHIC-PRINTING FRAME. JONATHAN R. SPENCER, Los Angeles, Cal. Filed Feb. 24, 1905. Serial No. 247,190.



Claim.—A printing-frame of the character herein described comprising two members pivotally secured together as shown; a pintle-bolt securing the same together; in combination with a serpentined-paper-holding spring wound around the pintle-bolt pivotally securing the members to the frame, one end of the spring being rigidly secured to one member of the frame and the other end thereof adapted to project over the face of the other member when the members are in their open position.

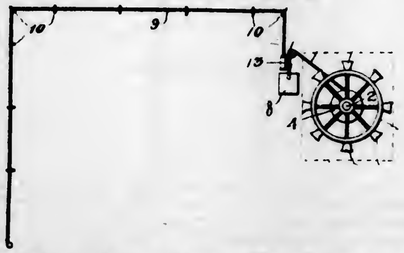
818,532. PROCESS FOR THE ELECTROLYTIC PRODUCTION OF METALS OF THE EARTHY ALKALIES. CARL SUTER and BERTHOLD REBLING, Rathor, Germany. Filed Jan. 2, 1904. Serial No. 187,860.

Claim.—1. A process for the electrolytic production of metals of the earthy alkalies, consisting in melting the salt, effecting the electrolysis thereof, and causing the relative movement of the cathode with reference to the electrolyte substantially as described.

2. A process for the electrolytic production of metals of the earthy alkalies, consisting in melting the salt effecting the electrolysis thereof, and causing the slow movement of the cathode from the surface of the electrolyte during the electrolysis substantially as described.

3. A process for the electrolytic production of calcium consisting in the melting of a calcium salt, the electrolysis thereof, and causing the slow movement of the cathode with reference to the electrolyte during the electrolysis substantially as described.

818,533. AUTOMATIC FIRE-ALARM. WILLIS A. SUTTLE, Nimrod, Tex. Filed Aug. 10, 1905. Serial No. 273,668.



Claim.—In a fire-alarm of the character described, the combination with a revolubly-mounted wheel, of bells secured thereto, a winding drum or spool formed on the extended hub of said wheel, a cord or strap adapted to be wound on said drum or spool, a guide-pulley around which the free end of said cord is adapted to pass, a receptacle secured to said free end of the cord, a suitably-supported combustible cord adapted to be stretched around a room or building and secured at one end, a weight secured to the opposite end of said cord whereby should said cord be parted the weight will drop into the receptacle on said wound cord or strap and thereby unwind the same, thus revolving said wheel and sounding said bells, substantially as described.

818,534. FOUNTAIN-PEN. GEORGE SWANSTON, Upper Norwood, England, assignor to Thomas De La Rue and Company, Limited, London, England. Filed Sept. 18, 1905. Serial No. 278,203.

Claim.—1. In a fountain-pen the combination of a reservoir having an enlarged bore at the pen end, a longitudinal rod passing out through the rear of the reservoir and a piston fixed to the rod and lightly fitting the reservoir in the rear of the enlarged bore substantially as described.

2. In a fountain-pen the combination of a reservoir having an enlarged bore at the pen end, a longitudinal rod passing out through the rear of the reservoir, a piston fixed to the rod and lightly fitting the reservoir in the rear of the enlarged bore, a valve on the forward end of the rod and a valve-seating for the valve substantially as described.

818,535. HINGE FOR STEP-LADDERS. CHARLES TOTTENDORF, Cincinnati, Ohio. Filed Aug. 19, 1905. Serial No. 274,227.

Claim.—In a step-ladder hinge, the combination of two complementary hinge members, each comprising an attaching-flange for

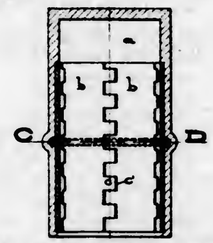
spring-catch self-actuating to permit engagement of the plate and support but locking them against disengagement, means for disen-

10. In a receptacle-holder, a support having means for sustain-

allel conductor-sleeves, and an enlarged insulation-sleeve formed of

Claim.—In a step-ladder hinge, the combination of two complementary hinge members, each comprising an attaching-flange for connection to the upper ends of the ladder parts to be hinged to each other, one of these hinge members provided with a lug A, having two alined slots, each of which is laterally enlarged in the same direction, the other member having two integral elongated lugs projecting from it and fitted to occupy the slots mentioned in a manner to be free to slide therein longitudinally and also to move laterally into their enlarged parts when opposite them, the lower one of these elongated lugs projecting also above and downwardly over the lower edge of the opening which it occupies, to prevent lateral displacement of the engaged hinge members.

813,586. CYLINDER FOR INTERNAL-COMBUSTION MOTORS AND THE LIKE. MAX THUM, Erfurt, Germany. Filed Mar. 28, 1904. Serial No. 200,448.



Claim.—1. In a cylinder for internal-combustion engines and the like, the combination with the body portion of the cylinder, of an interior lining consisting of a plurality of parallel parts, extending parallelly to the longitudinal axis of the cylinder and means adapted to prevent a relative displacement of one part of the lining with respect to another, for the purpose as described.

2. In a cylinder for internal-combustion engines and the like, the combination with the body portion of the cylinder, of an interior lining consisting of a plurality of parallel parts extending parallelly to the longitudinal axis of the cylinder, the longitudinal edges of each part having projections adapted to enter into corresponding recesses of the adjoining edge of the neighboring part, substantially and for the purpose as described.

3. In a cylinder for internal-combustion engines and the like, the combination with the body portion of the cylinder, of a lining consisting of a plurality of parallel parts, and means adapted to prevent a relative displacement of one part of the lining with respect to another, the thickness of each part of the lining increasing in the direction from the closed end of the cylinder to the open end, substantially and for the purpose as described.

4. In a cylinder for internal-combustion engines and the like, the combination with the body portion of the cylinder, of a lining consisting of a plurality of parallel parts, and means adapted to prevent a relative displacement of one part of the lining with respect to another, the thickness of each part of the lining increasing in the direction from the closed end of the cylinder to the open end, in such a manner, that the outer diameter of the lining increases correspondingly, the bore of the cylinder being correspondingly shaped, and means for forcing said lining into the cylinder, substantially as described.

813,587. RECEPTACLE-HOLDER. HARRY P. TOWNSEND, New Britain, Conn., assignor to The American Serial Lock Company, Hartford, Conn., a Corporation of Connecticut. Filed May 8, 1905. Serial No. 259,259.

Claim.—1. In a receptacle-holder, a support and a clamp-plate having coöperating beveled surfaces for increasing the pressure of the parts one upon the other in a longitudinal movement of a part, a spring-catch self-actuating to permit engagement of the plate and support but locking them against disengagement, means for disengaging said catch, and means for operating the spring-catch to disengage the plate and support.

2. In a receptacle-holder, a support and a clamp-plate, interengaging rigid projections from the support and plate to permit engagement and disengagement with but slight relative movement of one of the parts upon the other, a spring-catch self-actuating to permit engagement of the support and plate but locking them against disengagement, means for disengaging said catch, and means for operating the spring-catch to disengage the plate and support.

3. In a receptacle-holder, a support and a clamp-plate having projections with interengaging beveled surfaces, for increasing the pressure of the parts in a relative longitudinal movement thereof and permitting engagement and disengagement with but a slight relative movement of one of said parts on the other, a spring-catch self-actuating to permit engagement of the support and plate but holding them against disengagement, means for disengaging said catch, and means for operating the spring-catch to disengage the plate and support.

4. In a receptacle-holder, a support and a clamp-plate having interengaging beveled surfaces at one end for increasing the pressure of the parts in a relative longitudinal movement thereof and a toe engaging a socket at the opposite end, a spring-catch self-actuating to permit engagement of the plate and support but holding them against disengagement, means for disengaging said catch, and means for operating the spring-catch to disengage the plate and support.

5. In a receptacle-holder, a clamp-plate and a support provided at one end with projections permitting engagement and disengagement of the parts with but slight relative movement of one part upon the other, said projections having coöperating beveled surfaces for increasing the pressure of the parts in a relative longitudinal movement thereof to hold them in engagement, a toe engaging a socket at the opposite ends of the plate and support, a spring-catch self-actuating to permit engagement of the plate and support but locking them against disengagement, means for disengaging said catch, and means for operating the spring-catch to disengage the plate and support.

6. In a receptacle-holder, a support and a clamp-plate having interengaging rigid projections of little length as compared with the length of the parts whereby engagement and disengagement is permitted with slight relative movement of one of the parts upon the other, a spring-catch self-actuating, to permit engagement of the plate and support but locking them against disengagement, means for disengaging said catch, and means for operating the spring-catch to disengage the plate and support.

7. In a receptacle-holder, a support and a clamp-plate having interengaging projections of little length as compared with the length of the parts whereby they may be engaged and disengaged with but slight movement of one part upon the other, said projections having coöperating beveled surfaces for increasing the pressure of the parts in a relative longitudinal movement thereof to hold them in engagement, a spring-catch self-actuating to permit engagement of the plate and support but preventing disengagement thereof, means for actuating said catch, and means for operating the spring-catch to disengage the plate and support.

8. In a receptacle-holder, a support and a clamp-plate, one of which has short prongs extending upward from one end thereof, and the other of which has a coöperating short projection extending upward from the end thereof, means for engaging the bottom of the support and plate, a spring-catch self-actuating to permit engagement of the plate and support, but holding them against disengagement, and means for actuating the catch to permit disengagement of the plate and support.

9. In a receptacle-holder, a support and a clamp-plate, one of which has prongs on the upper end thereof, and the other of which has a coöperating engaging projection from the upper end thereof, said projection and prongs having beveled surfaces for forcing the support and plate tightly in engagement, means for holding the lower ends of the plate and support in engagement, a spring-catch self-actuating to permit engagement of the plate and support, but holding them against disengagement, and means for operating the spring-catch.

10. In a receptacle-holder, a support having means for sustaining it, a clamp-plate to be secured to the receptacle, means for holding said plate and support in engagement, and a spring-catch located on the clamp-plate and with one end to engage a stop on the support, and means for actuating said spring-catch to permit disengagement of the parts.

11. In a receptacle-holder, a support and a clamp-plate, one of which has prongs extending from the upper end thereof and the other of which has a projection extending between said prongs and with lateral extensions to engage therewith, means for engaging the lower ends of the plate and support, and means for preventing disengaging movement of said plate and support.

12. In a receptacle-holder, a support to be secured to an object, a receptacle, a clamp-plate secured to said receptacle, prongs extending from the support with their ends resting against the receptacle, a projection from the clamp-plate to engage said prongs, and means for holding said plate and support in engagement.

13. A support having means for sustaining it, a receptacle, a clamp-plate to be secured to the receptacle, prongs projecting from the upper end of the support with their ends resting against the receptacle, a projection from the clamp-plate to engage said prongs, said prongs and projections having interengaging beveled surfaces for forcing the parts tightly in engagement, means for holding the lower ends of the plate and support in engagement, and means for preventing disengaging movement of the plate and support.

14. In a receptacle-holder, a support and a base-plate, means for holding said plate and support in engagement, a swinging catch-lever mounted on the clamp-plate with its end to engage a stop on the support, a spring for holding said lever in position to self-engage said stop, and means for disengaging said lever from said stop.

15. In a receptacle-holder, a support and a clamp-plate having coöperating beveled surfaces for increasing the pressure of the parts in a relative longitudinal movement thereof to hold them in engagement, and means for locking said plate and support in engagement.

16. In a receptacle-holder, a support and a clamp-plate having interengaging projections to permit engagement and disengagement with but slight relative movement of one of the parts upon the other, said projections being beveled to increase the pressure of the parts in a relative longitudinal movement thereof to hold them in engagement, and means for locking said plate and support in engagement.

17. In a receptacle-holder, a support having means for sustaining it, a clamp-plate to be secured to the receptacle, means for holding said plate and support in engagement, a spring-catch located on the clamp-plate and with one end to engage a stop on the support, said clamp-plate having an opening located opposite the lever whereby the latter may be operated to be disengaged from said stop.

18. In a receptacle-holder, the receptacle, a support to be secured to an object and a clamp-plate to be secured to said receptacle, means for securing the support and plate one of which has prongs extending therefrom with their ends adapted to rest against the opposite part, and the other of which has projections to engage said prongs, and means for holding said plate and support in engagement.

19. In a receptacle-holder, a support having means for sustaining it, a clamp-plate to be secured to the receptacle, means for holding said plate and support in engagement, one of which bears a spring-actuated lever fulcrumed between its ends and the other of which has a stop to engage the end of the lever, and means for permitting access to the end of said lever to effect its disengagement from said stop.

20. In a receptacle-holder, a support having means for sustaining it, a clamp-plate to be secured to the receptacle, means for holding said plate and support in engagement, a spring-actuated lever fulcrumed between its ends on the clamp-plate and with one end to engage a stop on the support, and means to permit access to said lever to disengage it from said stop.

813,588. CONNECTOR FOR ELECTRICAL CONDUCTORS. FREDERICK J. TROLL, Baltimore, Md. Filed Apr. 3, 1905. Serial No. 253,200.

Claim.—1. In an electrical-conductor connector, a pair of connected parallel conductor-sleeves, and an enlarged insulation-sleeve at each end of the pair of conductor-sleeves.

2. In an electrical-conductor connector, a pair of connected parallel conductor-sleeves, and enlarged insulation-sleeves at opposite ends of the conductor-sleeves, said insulation-sleeves being in alinement with one another.

3. In an electrical-conductor connector, a pair of connected parallel conductor-sleeves, and an enlarged insulation-sleeve formed of soft metal, located at each end of the pair of conductor-sleeves.

4. In an electrical-conductor connector, a pair of connected parallel conductor-sleeves, and an enlarged insulation-sleeve formed of soft metal, located at each end of the pair of conductor-sleeves; said enlarged insulation-sleeves being in alinement with one another.

5. In an electrical-conductor connector, a pair of connected parallel conductor-sleeves, and a pair of insulation-sleeves, one at each end of the connector, said insulation-sleeves being disposed so that the conductor-wires lead from the connector in alinement with one another.

6. In an electrical-conductor connector, a pair of connected parallel conductor-sleeves, and a pair of insulation-sleeves one at each end of the connector, said sleeves being provided with slits.

7. In an electrical-conductor connector, a pair of connected parallel conductor-sleeves formed of soft metal to be twisted, and an enlarged insulation-sleeve at one end of the pair of conductor-sleeves.

813,589. LAWN-EDGER. GAIUS VINCENT, Minneapolis, Minn., assignor of one-half to Henry Woelfelt, Minneapolis, Minn. Filed Oct. 11, 1905. Serial No. 282,269.

Claim.—1. A lawn-edger comprising a channel-shaped cutter for cutting a groove, and provided with a guide-flange adapted to slide upon the upper surface of the adjacent edge of a sidewalk, of a handle formed with prongs at its lower end, said prongs being attached one to said guide-flange and the other to the outer side plate of said cutter, whereby a strip of sod loosened by the cutter may pass directly rearward between the prongs of said handle, substantially as described.

2. In a lawn-trimmer, the combination with a channel-shaped cutter having a guide-flange adapted to slide upon the upper surface of the adjacent edge of the sidewalk, the outer side of said side plate being curved at its rear portion, so as to turn the loosened strip of sod onto the sidewalk, of a handle having prongs at its lower end attached one to each side of said cutter, in such manner that the loosened sod may pass rearward between said prongs, substantially as described.

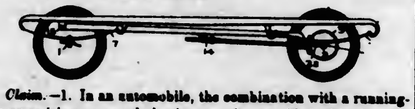
813,540. REINFORCED CONCRETE CONSTRUCTION. CHARLES H. BLACK, Pottsville, Ind. Filed Jan. 21, 1905. Serial No. 242,324.

Claim.—1. A concrete construction having a plurality of reinforcing-cores embedded therein, said cores being formed of a series

of separable links each provided at one end with a transverse bar and having their opposite ends provided with terminal hooks the bills of which are open and slidably engage the transverse bar of an adjacent link.

2. A concrete construction having a plurality of reinforcing-cores embedded therein, said cores being formed of a series of separable links each comprising a pair of spaced arms, the ends of which are bent laterally beyond the general plane of the links and connected by an unobstructed transverse bar, said arms terminating in rearwardly-disposed hooks the bills of which are spaced from said arms and slidably engage the connecting-bars of adjacent links.

818,541. AUTOMOBILE. FRANK M. BLAIR, Toledo, Ohio. Filed July 15, 1905. Serial No. 269,894.



Claim.—1. In an automobile, the combination with a running-gear comprising a rear axle having a casing provided with a bearing extending forward radial to the casing, and with rotatable axles, a front axle parallel with the rear axle, a pair of springs fixedly mounted transverse each axle, and a main body-supporting frame having side bars directly mounted and supported on the springs, of a subsidiary frame having its front end portion hinged at a plurality of points to the front end portion of the main body-supporting frame between the side bars, and its rear end extended to the rear axle and rotatably mounted on the radial bearing, a motor mounted on the subsidiary frame, a shaft connected to the motor and extending in direct line from the connection through the radial bearing of the rear axle, means connected to the shaft and the inner axles adapting the shaft to rotate the axles, a sleeve mounted concentric to the shaft between the motor and the radial bearing, and fixedly supported by the subsidiary frame, a radius-head rotatably mounted on the sleeve concentric to the shaft, and radius-rods diverging from the radius-head and secured to the rear axle.

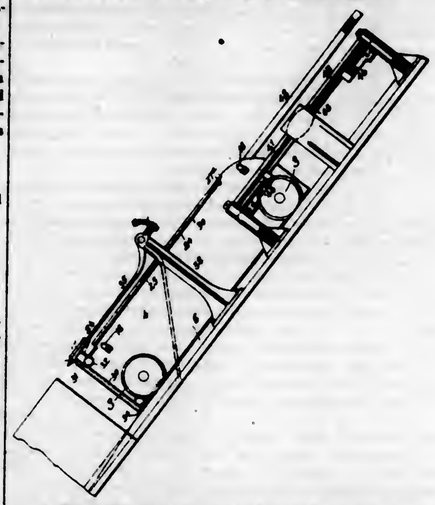
2. The combination in an automobile running-gear, of a tubular rear axle having a central gear-case provided with a tubular bearing extending forward radial to the axle, said axle being also provided with inner axles that are gear-connected within the gear-case, a front axle parallel with the rear axle, a pair of half-elliptic springs, mounted transverse each axle, a main body-supporting frame hinged and linked to and supported on the ends of the springs of the axle, as set forth, a subsidiary motor-supporting frame, having its front end portion hinged to the front end portion of the main body-supporting frame on each side of a line parallel with and central between the side bars of the main frame, and its rear ends centrally and pivotally supported by the tubular bearing on the gear-case, a motor mounted on the subsidiary frame, a differential gear mechanism mounted on the frame adapted to be operated by the motor, a sleeve secured to and supported by the motor-supporting frame in line with and between the tubular bearing of the gear-case and the differential gear mechanism, a tubular radius-head rotatably mounted on the sleeve, radius-rods diverging at equal angles from the radius-head, and secured to the rear axle, a driving-shaft adapted to be revolved by the differential gear mechanism of the motor, and extending in direct line with and through the journal-sleeve, radius-head, and the bearing of the gear-case, and a gear on the shaft within the gear-case connected with and adapted to operate the gear of the inner axles substantially as set forth.

818,542. PACKAGE AND LETTER DELIVERING AND COLLECTING SYSTEM. JOHN M. CASE, Louisville, Ky. Filed Sept. 5, 1905. Serial No. 277,873.

Claim.—1. The combination of a conduit broken away at points, a track in said conduit, a shed covering the track where the conduit is broken away, said shed being of a size to admit a person, a carrier traveling on said tracks, and a receptacle arranged below the track.

2. The combination with a track having receiving-stations at points throughout its length, of a carrier having a plurality of removable package-holders, arranged in order corresponding to the stations, and automatic means for successively removing the package-holders on the outgoing trip of the carrier, and delivering said holders to the carrier on the return trip of the carrier.

3. The combination with a track, of a carrier, means for propelling the carrier on the track, automatic means for discharging packages from the carrier on the outgoing trip and placing packages on the carrier on the return trip while the carrier is in motion, and means automatically reversing the direction of the carrier.



4. The combination of a conduit having receiving-stations at points throughout its length, a carrier traveling in said conduit, and having package-holders arranged thereon in order corresponding to the stations, means for automatically discharging a package at its station from the carrier, and means for automatically collecting the packages on the return trip.

5. The combination of a carrier, of a plurality of package-holders arranged in a line on said carrier and means for separately and automatically feeding said holders perpendicularly with relation to the line of holders whereby the perpendicularly-fed holder may be engaged and removed from the carrier.

6. The combination with the carrier, having package-holders arranged thereon, in a line, of means feeding said holders perpendicularly with relation to the line, and means feeding the holders to the perpendicular feeding means.

7. The combination with the track, of a carrier for travel on the track, having package-holders arranged in a line on said carrier and means for separately and automatically feeding said holders perpendicularly with relation to said line; and means arranged along the track for removing the holders from the carrier after they have been fed perpendicularly.

8. A carrier for delivery systems comprising a series of package-holders, means for elevating one of the package-holders at a time and means for moving the package-holders to the elevating means.

9. A carrier for delivery systems comprising guide-faces, holders slidable on the guide-faces, a spring-pressed follower for the holders, and means for slightly moving a holder above the remaining holders.

10. The combination with the track, of inclined planes located at a plurality of points along the track, a carrier traveling along the track and carrying a plurality of package-holders, means carried by the carrier, engaging the inclined track and causing one of the package-holders to be moved to a position to be engaged, and means along the track for engaging the holder thus moved.

11. The combination with a track, of a carrier traveling on the track and carrying a plurality of package-holders, means for singly moving the package-holders to a position to be engaged, and a swinging arm adapted to engage the moved package-holder and remove it from the carrier when the carrier is traveling in one direction, and to support a holder and deposit it on the carrier when the carrier is traveling in the other direction.

12. The combination of a traveling carrier carrying package-holders, and automatic means successively removing package-holders from the carrier when the carrier is traveling in one direction, and depositing them on the carrier when the carrier is traveling backward.

13. The combination with a track, of a carrier traveling thereon in both directions, means for automatically reversing the direction of the carrier, and means for automatically removing packages from the carrier when it travels in one direction and automatically depositing packages on the carrier when it travels in the other direction.

14. The combination with the track, of a carrier adapted for traveling in both directions thereon, an electrical conductor along the track, an electrical motor carried by the carrier and receiving current from the conductor, a switch carried by the carrier, and means automatically reversing the switch to cause a reversal of the motor.

15. The combination with the track, of a carrier adapted for travel in both directions on the track, a motor carried by the carrier, a controller for the motor carried by the carrier, and means automatically moving said controller to cause a reversal of the motor.

16. The combination with a track and a carrier, of means for automatically removing packages from the carrier, located along the track and normally positioned to remove the packages but moving under the weight of the package to discharge said package and then returning to its normal position.

17. The combination with the track and the carrier, of a spring-pressed swinging arm normally held in a position to remove a package from the carrier and moving under the weight of the package to discharge the package and then return to its normal position.

18. The combination with the track and the carrier, of means on the carrier for feeding package-holders to a position to be engaged, receptacles located at various points along the track and means adjacent the receptacles normally positioned to remove a package-holder and cause it to be deposited in the receptacle.

19. The combination with the track and the carrier, of means for removing packages from the carrier, arranged along the track, and a signal operated by the package-removing means when a package is removed.

20. The combination with the track and the carrier, of means for propelling the carrier along the track, and means arranged along the track for stopping the carrier, said means embodying an air-chamber and means permitting the air to gradually escape and permit the carrier to proceed.

21. The combination with the carrier and a track on which it travels, of a stopping or retarding means for the carrier arranged along the track and embodying means for engaging the carrier, an air-chamber acting on said means to hold it in an engaging position said means gradually permitting the escape of air from the chamber to permit the carrier to proceed.

22. The combination with the carrier and a track on which it travels, of a stopping or retarding means for the carrier arranged along the track and embodying means for engaging the carrier, an air-chamber acting on said means to hold it in an engaging position, means gradually permitting the escape of air from the chamber to permit the carrier to proceed, and a spring moving the air-chamber-engaging means in a direction to cause the air to enter the air-chamber and cause the engaging means to be projected into the path of the carrier.

23. The combination with the track, of a carrier, means for propelling the carrier along the track, and means arranged along the track for stopping the carrier, and means automatically reversing the carrier.

24. The combination with a track, of a carrier open at one end, and means for automatically removing packages from the carrier through the open end when the carrier is traveling in one direction and automatically depositing packages in the carrier through the open end when the carrier is traveling in the other direction.

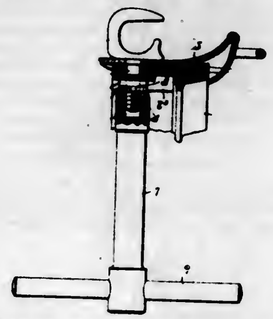
25. The combination with the carrier, of holders sliding on the carrier and adapted to have packages suspended therefrom, and means for moving the holders to the rear of the carrier.

26. The combination with a track, of a carrier for travel thereon, carrying a plurality of package-holders, means along the track for causing a package-holder to be moved to a position to be engaged, and means along the track for engaging and removing a package-holder thus moved.

27. The combination with a track and a carrier movable on the track of package-holders successively arranged on said carrier, hooks suspended from the holders, and automatic means for removing from the carrier while it is in motion, a holder and a hook at various points along the track.

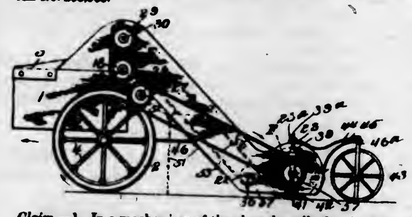
818,543. HARNESS. JOHN J. CRAMMER, Moline, Ill. Filed Aug. 30, 1905. Serial No. 276,422.

Claim.—1. The combination with a tree-frame provided on its inner side with reinforcing webs or flanges, and a check-hook having a shank projecting through the frame, of a nut engaging the shank of the hook and disposed between the webs or flanges and provided on its outer side with a longitudinal seat.



2. The combination with a tree-frame provided on its inner side with reinforcing webs or flanges, and a check-hook having a shank projecting through the frame, of a nut engaging the shank of the hook and disposed between the webs and flanges and provided on its outer side with a longitudinal seat, and a wrench provided with a longitudinal bore to receive the projecting end of the shank and a rectangular terminal to engage the walls of the seat.

818,544. STREET-SWEEPER. CHARLES M. HAVES, JOHN W. SLAVEN, and GEORGE W. WADE, Galesburg, Ill. Filed May 20, 1904. Serial No. 209,208.

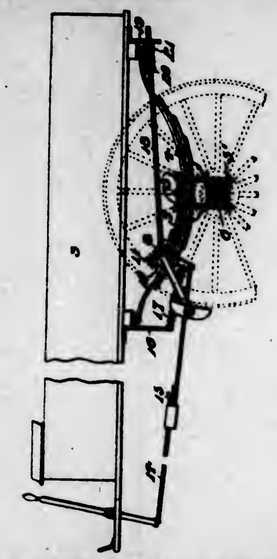


Claim.—1. In a mechanism of the class described, a framework consisting of forwardly-extended bars connected by a cross-piece, rearwardly-extended bars connected by a cross-plate, lower standards connecting the upper and lower bars of the framework, bearings in said standards for the reception of a shaft, upper standards connecting the upper and lower bars of the framework, bearings in said standards for the reception of a shaft, bearings at the rear parts of the forwardly-extended bars of the framework, for the reception of a shaft, and hangers depending from the lower bars of the framework and having bearings for the reception of another shaft, substantially as described.

2. A street-sweeper rear section comprising the casing D, the frame A having the standards B, the journal-boxes 16 therein, the journal-boxes 17, 19 fixed to the frame, the standards C, the journal-boxes 22 therein, the cross-plate 23, the adjustable hangers 39 depending therefrom, said hangers having their lower ends enlarged to form shaft-bearings, being contained within said casing, the caster-wheels 43 and means for attaching them to the rear portion of the casing.

3. In a street-sweeper and in combination with a wheel-supported forward section or dirt-receiver having a master-wheel fixed to one of the ground-wheels thereof, a rear section comprising a frame having journal-boxes 16, 17 at the forward portion thereof, journal-boxes 22 at the rear portion and journal-boxes 19 intermediate said boxes, the shaft 20 seated in the boxes 16 and carrying wheel 29, the shaft 32 seated in the boxes 17 and carrying wheels 18, 31, the sprocket-chain embracing said wheels, the shaft 26 seated in the boxes 19 and carrying wheels 25, 27, the shaft 36 seated in the bearings 22, the endless belt 38 on the shafts 20 and 26, the cross-bar 23, the adjustable hangers 39 carrying a broom-shaft 41, the sprocket-wheel 57 on said last-named shaft, the sprocket-chain 56 embracing the wheels 27 and 57, the wheel 25 meshed with the master-wheel, and caster-wheels secured to the rear portion of the frame.

818,545. VEHICLE-BRAKE. JOHN G. RECHT, Pittsburg, Pa. Filed May 18, 1905. Serial No. 261,022.



Claim.—1. The combination of a brake, an operating-rod connecting to a crank-arm of brake-shaft, brake-strap secured to spring, and means for preventing the forward thrust of vehicle-body, substantially as described.

2. The combination of a brake, an adjustable operating-rod pivotally connected to a crank-arm, said crank attached to a retracting-spring, a brake-strap normally held flat by a stirrup, substantially as described.

818,546. INCLOSED SAFETY DEVICE FOR FUSES FOR ELECTRICAL INSTALLATIONS. WILHELM FELLENBERG, Charlottenburg, Germany. Filed Apr. 26, 1904. Serial No. 205,267.

Claim.—1. A safety device for fuses consisting in combination of fuse-wires, non-conductors upon which said wires are coiled and partitions between said wire coils substantially as described.

2. A safety device for fuses consisting in combination of fuse-wires connected in parallel non-conductors upon which said fuse-wires are coiled and partitions between said coils substantially as described.

3. A safety device for fuses consisting in combination of fuse-wires connected in parallel non-conductors upon which said fuse-wires are coiled, partition between said coils and an elastic yielding inclosure for said wires substantially as described.

4. A safety device for fuses consisting in combination of fuse-wires connected in parallel non-conductors upon which said fuse-wires are coiled, partition between said coils, an elastic yielding inclosure for said wires and filling material within said inclosure, substantially as described.

5. A safety device for fuses consisting in combination of fuse-wires connected in parallel non-conductors upon which said fuse-wires are coiled, partition between said coils, and an elastic yielding inclosure for said wires, and a non-conducting casing inclosing the whole, substantially as described.

6. A safety device for fuses consisting in combination of fuse-wires connected in parallel non-conductors upon which said fuse-wires are coiled, partition between said coils, an elastic yielding inclosure for said wires, and filling material within said inclosure, and a non-conducting casing inclosing the whole, substantially as described.

7. A safety device for fuses consisting in combination of fuse-wires, non-conductors upon which said wires are coiled and partitions between said wire coils, and an armature-core within said fuse-wire coils, substantially as described.

8. A safety device for fuses consisting in combination of fuse-wires connected in parallel non-conductors upon which said fuse-wires are coiled and partitions between said coils, and an armature-core within said fuse-wire coils, substantially as described.

9. A safety device for fuses, consisting in combination of fuse-wires sparking distances produced in series with said wires, and partitions between said fuse-wires, and an armature-core upon which said fuse-wires are mounted, substantially as described.

10. A safety device for fuses consisting in combination of fuse-wires, non-conductors upon which said wires are coiled and partitions between said wire coils, an elastic yielding inclosure for said wires, and a casing inclosing the whole, substantially as described.

11. A safety-fuse consisting in combination of fuse-wires, non-conductors upon which said wires are coiled said non-conductors being of elliptical form and partitions between said fuse-wires substantially as described.

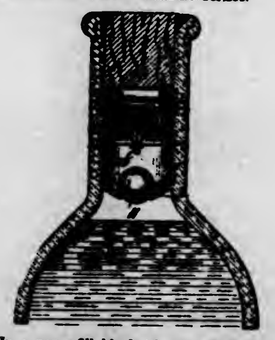
12. A safety-fuse consisting in combination of fuse-wires, non-conductors upon which said fuse-wires are coiled in series, partitions between the non-conductors conductors connecting the fuse-wires in series an inclosing casing divided longitudinally, said non-conductors being formed integral with the respective parts of said casing, bolts for connecting the respective parts of the casing together said bolts passing through said non-conductors upon which the fuse-wires are coiled and serving as armature-cores, substantially as described.

13. A safety-fuse consisting in combination of fuse-wires, non-conductors upon which said fuse-wires are coiled in series, partitions between the non-conductors, conductors connecting the fuse-wires in series an inclosing casing divided longitudinally, said non-conductors and partitions being formed integral with the respective parts of said casing, bolts for connecting the respective parts of the casing together said bolts passing through said non-conductors upon which the fuse-wires are coiled and serving as armature-cores and spaces within said casing between said partitions, yielding elastic inclosures within said spaces and filling material within said yielding elastic inclosures, substantially as described.

14. A safety-fuse consisting in combination of fuse-wires, non-conductors upon which said fuse-wires are coiled in series, partitions between the non-conductors, conductors connecting the fuse-wires in series, an inclosing casing divided longitudinally, said non-conductors and partitions being formed integral with the respective parts of said casing, partitions upon said non-conductors between which said fuse-wires are arranged in series, bolts for connecting the respective parts of the casing together said bolts passing through said non-conductors upon which the fuse-wires are coiled and serving as armature-wires, substantially as described.

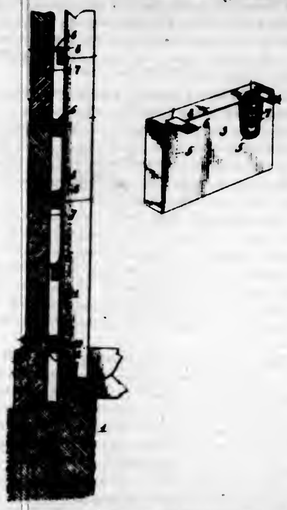
15. A safety device for fuses consisting in combination of fuse-wires, non-conductors upon which said wires are coiled and partitions between said wire coils and an inclosing casing therefor and outlets therefrom, substantially as described.

818,547. NON-REFILLABLE BOTTLE. CHARLES PERSKY, St. Louis, Mo. Filed Mar. 9, 1905. Serial No. 249,210.



Claim.—In a non-refillable bottle, a cylindrical valve-casing adapted to be positioned in the neck of the bottle, a valve-seat formed at the lower end of the valve-casing, a ball-valve normally resting on the valve-seat, a conical valve-protector arranged within the valve-casing above the ball-valve, which protector is provided with a continuous series of vertical slots, and a pin arranged transversely in the valve-casing beneath the protector, substantially as specified.

818,548. BUILDING CONSTRUCTION. GEORGE F. FISHER, North Tonawanda, N. Y. Filed Apr. 23, 1904. Serial No. 204,513.



Claim.—1. A structure comprising a frame having projecting ledges separated by intervening spaces, and building-blocks having securing-irons held therein and separated from said ledges by intervening spaces to permit of setting the blocks in perfect alinement, said securing-irons having each a rearwardly-projecting securing end adapted to be secured to said ledges.

2. A structure comprising a skeleton frame having projecting ledges separated by intervening spaces, and building-blocks having securing-irons held therein, each securing-iron comprising a vertical embedded portion and a free securing end arranged at a right angle to said embedded portion, said securing ends being attached to said ledges.

3. A structure comprising uprights and horizontal ledges, building-blocks secured to said ledges and separated therefrom by intervening spaces to permit of setting the blocks in perfect alinement.

4. A structure comprising uprights, building-blocks arranged in courses and having securing-irons held therein, each iron having at least one end projecting from said block, and retainer-bars secured to the uprights, one retainer-bar being arranged beneath the projecting ends of the securing-irons of each course of blocks to permit the latter to be affixed thereto.

5. A structure comprising uprights, horizontal bars attached to said uprights and being separated by intervening spaces, building-blocks set edge upon edge and each having at least one securing-iron held therein, each securing-iron having a rearwardly-projecting free securing end adapted to be secured to the horizontal bar in rear of the block of which it forms part, said building-blocks being separated from said horizontal bars by intervening spaces to permit of setting the same in perfect alinement.

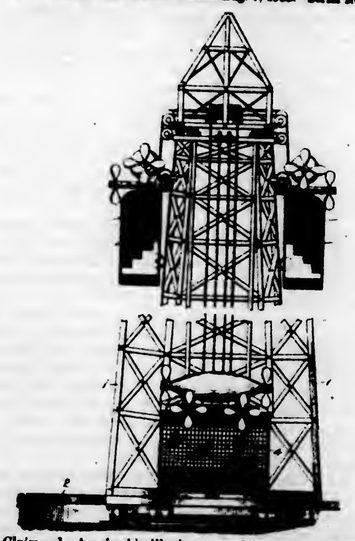
6. A building-block formed of composition material and having a securing-iron embedded therein, said securing-iron being bent at a right angle to form an embedded portion within the block and a securing portion having its outer face throughout its length flush with one edge of the block and extending beyond the rear face of the latter.

7. A building-block formed of composition material and having a securing-iron embedded therein, said securing-iron being bent at a right angle to form an embedded portion within the block and a securing portion having its outer face throughout its length flush with one edge of the block and extending beyond the rear face of the latter, said embedded portion of the securing-iron having apertures which are filled with the material forming the block.

8. A building-block formed of composition material and having a securing-iron embedded therein, said securing-iron being bent at a right angle to form an embedded portion within the block and a securing portion having its outer face throughout its length flush with one edge of the block and extending beyond the rear face of the latter, said embedded portion of the securing-iron having an embedded end portion, substantially as specified.

9. A structure comprising a frame having retainer-ledges, and building-blocks set edge upon edge and having securing-irons held therein with one end of each iron projecting beyond the rear face of the block for attachment to the retainer-ledges, one row of building-blocks being separated from its coöperating retainer-ledge to permit any other row of blocks to be set against its coöperating ledge, or to permit the same to be set farther from its coöperating ledge as may be necessary to provide a perfect alined outer surface.

818,549. REVOLVING AIR-SHIP TOWER. SAMUEL M. FRIEDE, Chicago, Ill., assignor to Revolving Air Ship Tower Company, Chicago, Ill., a Corporation of Illinois. Filed Aug. 7, 1903. Serial No. 168,584.



Claim.—1. An air-ship illusion comprising a tower, cars mounted to travel up and down on the exterior of the tower, and mirrors in the cars cutting off the tower from the view of the passengers within the car, substantially as described.

2. An air-ship illusion comprising a rotating tower, cars mounted to travel up and down on the exterior of the tower, and mirrors in the cars cutting off the tower from the view of the passengers within the car and reflecting to their eyes the natural landscape around the car, substantially as described.

3. An air-ship illusion comprising a tower, an elevator-car mounted to travel up and down on the tower, and an imitation-air-ship structure secured to each car and apparently supporting it, substantially as described.

4. An air-ship illusion comprising a tower, an elevator-car mounted to travel up and down on the tower, an imitation-air-ship structure secured to the car and apparently supporting it, and rotary propellers connected with the air-ship structure, substantially as described.

5. An air-ship illusion comprising a tower, cars mounted to travel up and down on the tower, means for cutting off the tower from the view of the passengers in the cars, and an imitation-air-ship structure secured to each car and apparently supporting it, substantially as described.

6. An air-ship illusion comprising a tower, elevator-cars mounted to travel up and down on the tower, means for cutting off the tower from the view of the passengers within the cars, an imitation-air-ship structure secured to each car and apparently supporting it, and rotary propellers connected with the air-ship structure and apparently driving it, substantially as described.

7. An air-ship illusion comprising a tower, cars mounted to travel up and down on the tower, means for cutting off the tower from

the view of the passengers within the cars, propellers mounted on the cars and apparently driving them, and means for rotating the propellers from the rising and falling movement of the car, substantially

a plurality of sets of two cars each, the two sets of cars being connected together to counterbalance each other, and the two cars of each set being arranged on opposite sides of the

extending from the rear of the main plate and movably connected thereto and a hooked grasping-loop extending from the front of said main plate and actuated by said lever, as and for the purposes specified.

10. In recording mechanism, means for making independent records in separate columns, and automatic mechanism for imprint-

the view of the passengers within the cars, propellers mounted on the cars and apparently driving them, and means for rotating the propellers from the rising and falling movement of the car, substantially as described.

8. An air-ship illusion comprising a tower, cars mounted to travel up and down on the exterior of the tower, means for cutting off the tower from the view of the passengers within the cars, an imitation-air-ship structure secured to each car and apparently supporting it, rotary propellers connected with the air-ship structure and apparently driving it, and means for rotating the propellers from the rising and falling movement of the cars, substantially as described.

9. An air-ship illusion comprising a tower, cars mounted to travel up and down on the tower, means for cutting off the tower from the view of the passengers within the cars, rotary propellers mounted on the cars and apparently driving them, guide-wheels on the cars rotatably engaging guides on the tower, and connections between said propellers and guide-wheels for rotating the propellers when the car is moved on the tower, substantially as described.

10. An air-ship illusion comprising a tower, cars mounted to travel up and down on the exterior of the tower, mirrors in the cars cutting off the tower from the view of the passengers within the cars, and an imitation-air-ship structure secured to each car and apparently supporting it, substantially as described.

11. An air-ship illusion comprising a tower, elevator-cars mounted to travel up and down on the exterior of the tower, mirrors in the car for cutting off the tower from the view of the passengers within the cars, an imitation-air-ship structure secured to each car and apparently supporting it, and rotary propellers connected with the air-ship structure and apparently driving it, substantially as described.

12. An air-ship illusion comprising a rotating tower having elevator-cars, a rotating platform from which the cars may be loaded and unloaded without stopping the tower, and mirrors in the cars cutting off the tower from the view of the passengers within the cars, substantially as described.

13. An air-ship illusion comprising a rotating tower, cars mounted to travel up and down on the exterior of the tower, mirrors in the cars cutting off the tower from the view of the passengers within the car, and a rotating platform from which the cars may be loaded and unloaded without stopping the tower, substantially as described.
